The

Electrical Review

VOL. XCVII. JULY 3, 1925. No. 2,484.

THE OLDEST ELECTRICAL PAPER. ESTABLISHED 1872.

Published every FRIDAY, Price 6d.

Chairman: H. ALABASTER.

Technical Editor: A. H. ALLEN, M.I.E.E. *Joint Managing Directors:* G. H. ALABASTER. E. A. GATEHOUSE, M.I.E.E. A.M.INST.C.E. *Commercial Editor:* A. H. BRIDGE.

Manager and Secretary: E. S. MIDDLETON.

OFFICE: 4, LUDGATE HILL, LONDON, E.C.4.

Telegraphic Address: "AGEEKAY, CENT., LONDON," Code, A B C. Telephone Nos.: Central 8260 and 8261.

The "Electrical Review" is the recognised medium of the Electrical Trades, and has by far the Largest Circulation of any Electrical Industrial Paper in Great Britain.

SUBSCRIPTION RATES, Postage Free: United Kingdom, £1 14s. 8d.; Canada, £1 12s. 6d.; Colonial and Foreign, £2 1s. 6d. per annum Cheques and Postal Orders (on Chief Office, London) to be made payable to THE ELECTRICAL REVIEW, LIMITED, and crossed "Midland Bank, Newgate Street Branch."

Standards of Quality and Performance.

CONSIDERATION of the new I.E.E. Regulations for the electrical equipment of buildings again raises the question of the possibility of establishing a British Bureau of Standards, or Proving House, to which consultants, insurance offices, supply authorities, manufacturers, and users could refer for definite and authoritative information as to whether apparatus or accessories complied with the requirements of safety and efficiency.

It will be remembered that the late Mr. C. H. Wordingham devoted much time and energy to the subject; and a Committee was appointed by the Institution of Electrical Engineers to investigate the matter, but nothing has been heard of it in recent years. There can be little doubt that electrical manufacturing and installation engineers in the British Isles have been for a long time at a disadvantage as compared with engineers in the United States of America. In that country, electrical accessories and installation practice are all more or less rigidly controlled by the National Board of Fire Underwriters, who not only issue a Code of requirements, but also possess an elaborately equipped laboratory and are prepared to test and certify whether any piece of apparatus complies with the Code or not. The approval of the Board is accepted by practically all engineers and supply authorities as an implied guarantee that the goods are suitable for their purpose.*

It is not difficult for an American manufacturer, familiar with the requirements of the Code, to design and manufacture goods secure in the knowledge that once the testing fees are paid, approval is obtained, and the label affixed, his goods will be accepted from side to side and from end to end of the North American Continent. This means that standard articles can be produced without variation, and every advantage can be taken of the economies of large-scale production, with the consequent reduction of costs and prices.

In the British Isles we have no such supreme authority. Each manufacturer, anxious to please some section of the industry, works out his own problems, makes arrangements for his own tests, and evolves patterns which he feels and hopes will please his own limited range of customers, with the certain knowledge, gained by painful experience, that however perfect the product, there will be a considerable number of supply

* A full account of the organisation of the Underwriters' Laboratories (Inc.) was given in a report by Mr. C. Hamilton Wickes to the Board of Trade. See ELEC. REV., January 3rd, 1913.

607872

authorities and consulting engineers who will require modifications made, entirely outside such regulations as exist, before it meets with their approval. On these lines it is clearly difficult to standardise designs or to take advantage of the economies of large-scale production.

It may be urged that the British freedom of practice has been fruitful of progress in design; possibly it has, but obviously a very large number of variations and quite unnecessary patterns are produced, all of which must in the long run be paid for by the industry, and the lack of an authority on standards of quality has certainly permitted the use of a very large amount of foreign and other accessories of a quality very much below that which would be accepted and marked by any responsible testing authority.

The National Board of Fire Underwriters is financed by the insurance companies, and maintains an elaborately equipped laboratory, which is run on business lines, the testing fees from manufacturers and the sales of the labels defraying most, if not all, of the expenses, in much the same way as in England the fees for the hall-marking of gold and silver wrought plate cover the expenses of the various Assay Offices. It is to be noted that the slogan of the underwriters' laboratories is: "For Service—Not Profit."

As the American National Board has the active support of all the insurance offices, its powers are extensive and peculiar. The labels issued by the Board for affixing to approved apparatus act as a guarantee to the user, and even more important, to the manufacturer, that the goods so marked comply with the code and will be accepted for use upon any installation in the United States of America or in Canada. This is real "service," and as such is, one hopes, willingly paid for by the manufacturers, and eventually by the consumer.

Matters are so arranged that it is almost, if not quite, impossible for a British or other manufacturer to secure the services of the Bureau. It is a little difficult to explain how this exclusion works, but there are several British manufacturers who have had experiences in this direction: some amusing, some painful, but all expensive and futile.

It will be seen, therefore, that the working of the Code and of the Testing Bureau closes not only the whole of the United States, but also the British Dominion of Canada, to British electrical apparatus and accessories —much more so than is possible under mere protective tariffs, however high they may be.

By this somewhat devious course, we come back to the new I.E.E. Rules. It is to be noted that a very large number of supply authorities and insurance companies have "adopted" the Regulations, but one wonders precisely how they are to satisfy themselves that the materials used in installation work under their control comply with them.

For instance, it is apparently not yet realised that Regulation No. 67, Clause "B" (Rule 96, old Rules), if insisted upon by supply authorities and insurance companies, would make obsolete practically all the commercial ironclad switch and fuse gear that is in use, and is at present being manufactured.

One presumes that the Regulation means what it says: that a switch rated by the manufacturer at, say, 100 amperes, 600 volts, must be capable of breaking circuit without flashing to case on a load of 150 amperes, at a pressure of 900 volts, with the case earthed; if so, it is exceedingly doubtful whether much of the gear being sold as suitable for 500- or 600-volt circuits complies with this regulation. (According to the annual report of the I.M.E.A., a Sub-Committee of the B.E.S.A. has decided that the margin of 50 per cent. is much too high.)

In any case, it is one of the weaknesses of the British system that there is no authority empowered to insist upon and certify compliance with any such regulations.

There is evidence that many of the manufacturers of electrical apparatus are protectionist in politics; but it may be suggested that a Proving House, properly supported by supply authorities and insurance companies, would furnish a very much more effective protection of British manufactures against cheap foreign accessories than would any import duties within the realm of practical politics.

Surely it is not beyond the wit of the various interests to devise such a scheme. The embryo is in the new I.E.E. Rules, and there is an actual example successfully working on the other side of the Atlantic. Will anyone who has had experience of the internal working of the American Underwriters' Laboratories please tell us something about them?

Invisible Atmospheric Pollution.

A NEW light is thrown upon the origin of many obscure forms of physical and mental disease and indisposition, which have become increasingly prevalent of recent years, in a highly suggestive monograph by Dr. W. Vernon Sinclair, entitled "Combustion and Atmosphere and their Relation to Disease."*

We are reminded in the foreword that the heating apparatus of greenhouses and hot-houses is always so arranged that no products of combustion can enter the houses, because "every gardener knows that plants wither and die if they are given air to breathe which is impregnated with gas and coke combustion products."

Stress is laid—and we think rightly—upon the incompleteness of the Smoke Abatement Committee's recommendations which, the author points out, "appear to be founded, not on the effects of combustion vapours which are virulently poisonous, but upon visible smoke which may be almost entirely composed of carbon, and therefore non-poisonous, though mechanically annoying and disturbing."

Among the invisible sources of atmospheric pollution, carbon monoxide is, in Dr. Sinclair's opinion, the most deadly. Like carbonic acid, it is tasteless, colourless, and odourless, but whereas carbonic acid acts chiefly by displacing oxygen, and does not form a chemical combination with any constituent of the blood, carbon monoxide is a true and active poison, not only displacing oxygen but entering into chemical combination with the haemoglobin of the blood, so that in continued inhalation, a store of organic poison remains in the *tissues*, and although the *blood* may be re-oxygenated by pure fresh air, muscular exertion will cause the blood to re-absorb carbon monoxide from the tissues, thus bringing about a return of the original symptoms. Hence a long-continued process of interchange between fresh air, blood, tissues, and tissue-cells is unavoidable for complete rehabilitation after breathing, for any length of time, air containing even a weak mixture of carbon monoxide.

In slow-combustion stoves, access of air is purposely restricted, thereby promoting the formation of carbon monoxide which, as Dr. Sinclair rightly points out, passes through hot cast iron with remarkable facility. He considers that the great extension of heating and cooking by gas and warming by slow-combustion stoves is responsible for the vitiation of the air of dwelling places to a degree which has become a menace to national health. Lighting, heating, and cooking by gas are therefore condemned, as well as slow-combustion stoves, unless they are so arranged that the removal of all products of combustion from the house is assured. The almost universal neglect of this necessary precaution has not escaped the notice of the authorities. A report to the Board of Trade on Carbon Monoxide in Public Gas Supplies, made by Mr. W. J. A. Butterfield, one of the Gas Referees, was issued on July 31st, 1924. Mr. Butterfield recommends the elimination from the trade of all types of fittings liable to become unsound after a few years' use, and all flueless "heaters" or other appliances which are apt to evolve carbon monoxide. He also recommends that the Board of Trade shall take steps, if found necessary, to secure to local authorities powers to stop the sale and supply in their

* John Bale, Sons & Danielsson, Ltd. 2s. net.

districts of gas appliances which do not fulfil the requirements as to trustworthiness. The results of lengthy atmospheric tests carried out by Dr. Sinclair in a well-built London house confirm the wisdom of Mr. Butterfield's recommendations.

We are not surprised to find Dr. Sinclair a strong protagonist of electricity for all domestic purposes, because the absence of *any* products of combustion in electric lighting, heating, or cooking appliances precludes the possibility of imperceptible (and therefore all the more dangerous) gradual poisoning by gases which are not detected by the senses.

The monograph is addressed *ad populum*, and although touching at times upon technical matter, will throughout be readily "understanded of the people."

Dr. Sinclair deals with an aspect of hygienics which heretofore has certainly not received the attention it deserves. His work should serve to awaken us to the risks to which we are exposed by the heating and lighting methods referred to, and to emphasise the importance of wider legislative powers to abate, not only *visible* smoke, but also the wholesale discharge into the atmosphere of manufacturing towns and cities, of quantities of *invisible* poison gases.

A Memorial to Michael Faraday.

WE learn with some surprise, from a paragraph in the *Evening Standard*, that no public memorial to Michael Faraday has yet been erected in this country. This statement has been made on the authority of his cousin, the Rev. J. W. Faraday, who knew him personally.

The great apostle of research, who laid the solid foundations upon which the whole superstructure of electrical engineering has been built, made no attempt to exploit commercially his epoch-making discoveries and inventions; for him it was sufficient reward to know that he had explored and opened up new fields, and he presented his priceless treasures to the world in return for a bare subsistence. Of necessity he lived and died in a period when the ultimate value of his gifts could not even be surmised, for there was no electrical industry to do honour to his name. It may be said of him, as of Sir Christopher Wren, that those who seek his monument need only look around; but are we to be content with such a recognition of the life-work of our greatest physicist? It is true that in every country of the world his work is to be seen—but it is not associated with his name.

We cannot believe that the great electrical industry of this country, Faraday's native land, which to-day is prosperous when other industries languish, will suffer the reproach to lie upon it that it failed to place on record in appropriate form its appreciation of his high merits, to which it owes its existence. Nor will the sister industry—that of manufacturing chemistry—which has recently celebrated the centenary of Faraday's discovery of benzene, be backward in remedying this omission. A committee should be set up to raise funds for the purpose of creating a memorial worthy of so great a subject, and we trust that the Council of the Institution of Electrical Engineers, which has already associated his name and portrait with its most honourable award for scientific merit, will hasten to be the first to take action.

Electricity Supply in Paris.

A RECORD of further progress is contained in the annual report of the Compagnie Parisienne de Distribution d'Electricité, which has a monopoly of the supply business in the French capital. The number of consumers, which stood in round figures at 379,000 at the close of 1923, increased during 1924 to 442,000, and the consumption of energy advanced from 300,948,000 kWh to 356,426,000 kWh. In 1924, 152 millions of this total represented the consumption of energy for power purposes, or an increase of 15 per cent. over 1923, while the consumption for lighting purposes rose by 21 per cent., from 168 millions to 204 millions. The maximum power supplied to the Paris network amounted to 225,000 kW, or 32,000 kW in excess of 1923, and in addition about 25,000 kW was purchased from other producing companies. A further development of the demand took place in the first quarter of 1925. The company has proceeded with the execution of the extension programmes approved by the City Council, sanction having been given since the end of 1918 to five programmes representing a total expenditure of 630,000,000 fr., of which 470,000,000 fr. had been expended down to the end of last year. A sixth scheme was presented to the City Council at the end of 1924, proposing an outlay of 156,000,000 fr. in order to bring the transforming and distributing plant on a level with the increased productive capacity of the generating stations. The share of the City in the net profits for 1924 amounts to 21,490,000 fr., while the surplus available to the company is 33,353,000 fr., permitting of the payment of a dividend at the gross rate of 60 fr. per share.

Electricity Supply—1920-1923.

IN our issue of Jan. 16th, 1925, we reviewed a Return compiled by the Electricity Commission, giving full particulars relating to authorised electricity supply undertakings in Great Britain, from the administrative side; we have now received from the Commissioners a companion volume, described as a "Return of Engineering and Financial Statistics" and covering the years 1920-1923. This volume of 628 pages contains a vast store of information and data, correct up to the end of March or middle of May, 1923, for local authorities, and to the end of 1922 for companies. The first questionnaire was issued in November, 1921. We understood that the Commissioners are considering the issue of a further Return as soon as possible, for the two years 1923-24 and 1924-25, and hope afterwards to issue a volume annually.

The present issue (which may be obtained from the Stationery Office, price 15s. plus postage) gives for all undertakings particulars of the system of supply, plant installed, max. demand and load factor, fuel consumption, output (analysed), and other data, for each of the three years covered; it also contains detailed statements of expenditure and revenue, working costs, surplus, and the mode of appropriation. These statistics occupy the bulk of the volume, the remainder being devoted to summary tables and generalised information regarding the technical and financial position of electricity supply undertakings, as well as classification tables, &c. Altogether it is a remarkable production, which will give food for cogitation and deduction in abundance, and whilst we have only been able at the moment to gauge its potentialities, we have no hesitation in congratulating its compilers on a monumental achievement, which reflects upon them the greatest credit.

It is interesting to contrast this huge effort with previous attempts on the part of the Government to compile statistical information regarding the electricity supply industry. The preface states: "A fact which impressed the Electricity Commissioners at the outset of their duties in 1920 was the lack of comprehensive official statistics covering the public supply of electricity in Great Britain as a whole"; no wonder—as far as we can ascertain, the only Returns previously issued were those prepared by the Board of Trade and published in 1901 and 1902, for the years 1899 and 1900. These were White Papers of 8 or 9 pages each, and were very incomplete; they dealt with only 126 local authorities and 63 companies, and cannot have been of much utility. But let us not be too critical of the work of an inadequate staff a long time ago; electricity supply was only a side line with the Board of Trade—it is the whole purpose of the Electricity Commissioners, whose Return will be dealt with more fully in a later issue.

D

Low-Frequency Inter-Valve Transformers.

Considerations affecting their Design.

By J. STEVENS.

IT is a curious fact that when any firm of electrical engineers decides to manufacture radio instruments, the first component which seems to receive attention is the l.f. intervalve transformer. Why this should be is hard to understand, since the correct design of such transformers is a very difficult matter requiring extremely careful study and consideration.

In common with power transformers, more widely known and understood in electrical circles, the intervalve transformer consists mainly of three parts: (*a*) iron core, (*b*) primary winding, and (*c*) secondary winding. If a satisfactory instrument is to be the result of our design, it is necessary to study these three main parts both separately and in combination. The design of the iron core is very dependent on the primary winding, so that it would be as well for us to study this winding first of all.

When telephony is being received, the primary of the intervalve transformer receives a current oscillating at frequencies varying from 200 to 3,000 cycles per second, rapid changes in the frequency taking place as the signal, which may be either speech or music, continues. In order to maintain the articulation in its original pure form the primary circuit must be quite free from any conditions which will tend to vary the frequencies or prevent their rapid change. Another desirable feature, from an efficiency standpoint, is that the impedance of the primary winding shall be as low as possible, although when the transformer receives its primary current from a thermionic valve, it is essential that this impedance shall not be less than the anode impedance of the valve to which it is coupled. The capacity of the winding should also be as low as possible in order to avoid resonance or "booming" effects at certain frequencies, while the high-frequency resistance and current-carrying capacity of the wire have also to be given consideration. In order to further avoid resonance effects, the inductance of the primary winding should be as high as possible. This, of course, will bring the natural frequency outside the limits of audibility.

To abbreviate these points, we can say that the desirable features of an intervalve transformer primary winding are:

(*a*) Low impedance, which, however, should not be lower than the anode impedance of the valve.
(*b*) Low self capacity, to avoid resonance effects.
(*c*) High inductance, to bring natural wavelength outside audible limits.
(*d*) Low high-frequency resistance and ample current-carrying capacity of wire.

Thus it will be seen that (*a*) is in itself a sort of compromise, while (*a*) and (*c*) are directly opposed to one another, and our problem seems very intricate even at this stage.

Now, as the winding possesses both capacity and inductance, we can look upon it as an oscillatory circuit, the natural frequency of which can be determined from the formula—

$$n = 5.033 \times 10^6 / \sqrt{CL}.$$

where n = oscillation frequency of circuit in cycles per second,
C = capacity in microfarads,
L = inductance in centimetres.

From this it will be seen that in order to bring the natural frequency outside the limits of audibility, the product LC must be made very small, thus making the natural frequency high.

If the primary of a transformer has a low impedance it follows that it must have a low inductance, and as, therefore, the winding will be small, it will possess a low capacity also, and this appears to meet the condition of having a natural frequency outside audible limits. In practice, however, we are confronted by another trouble in the shape of "howling" or the persistence of high-frequqency oscillation. This can be overcome by bringing the natural frequency of the primary much closer to the audible limit, and to do this we must either increase the inductance or the capacity. It will be realised from the opening remarks that both methods are detrimental, the former from the point of view of impedance, and the latter from that of resonance. The best solution apparently would be to provide an independent condenser across the winding and to keep the inductance as low as possible. With this arrangement the natural impedance and capacity of the coil are kept low, while the natural frequency of the winding combined with the condenser is brought closer to the audible frequency and "howling" eliminated. The shunting condenser will, in addition, tend to improve the power factor and consequently the efficiency.

With regard to the size of the wire to be used in winding the primary, a suitable size can be chosen from tabulated data to suit the range of frequencies. Generally speaking, however, No. 36 S.W.G. seems to best meet the conditions obtaining in the primary winding of an intervalve transformer.

Our next consideration is the iron core and, with the exception that the effects are magnetic, the conditions are the same as in the primary winding. The core receives high-frequency magnetic impulses whose strength is dependent on the ampere turns in the primary winding. For pure transformation it is essential that these impulses shall be in absolute synchronism and have a wave form identical with the current oscillations producing them. Should any form of natural or superposed non-synchronous magnetic impulses be present, or reluctance in the iron to rapid changes of flux, distortion of the wave form will result.

The ideal iron core would have a straight line magnetising and de-magnetising characteristic curve, but, of course, this is a practical impossibility. The degree of magnetism of the iron is also an important factor, as if too little, or too much, ripples will be set up in the wave form.

In the case of an iron core working on the flat portion at the upper end of the magnetising curve, the resultant wave will be flat-topped, and a strong harmonic of three times the fundamental frequency will be produced. This will be impressed upon the fundamental from which it will differ in phase by 180 deg., and will not only distort the wave form, but will also affect the hysteresis of the core in so far that it will now have to handle a secondary flux three times the frequency of the fundamental flux and 180 deg. out of phase with it. This will tend to neutralise the fundamental and produce "woolliness" of articulation. Similar conditions, although less marked, will be obtained if the iron is worked at the flat portion at the bottom of the magnetising curve.

The magnetic inductance of the iron used for the core should be about 3,000 lines per sq. cm., *i.e.*, on the steepest portion of the magnetising curve, at which point very rapid changes in the frequency of the magnetic impulses can be obtained with the minimum of distortion.

An excellent core can be made up from "Stalloy" stampings of "T" and "U" shape, assembled alternately so that no gaps occur due to the overlapping of the pieces. Each lamination should be insulated from its neighbours by paper and arranged so that the "U" section is completely insulated from the

"T" section. It is of the utmost importance when using shell-type laminations that there shall not be a complete circuit of iron round the coil. No rivets should be used to clamp the core, but the laminations should be held together by two clamps, also insulated from the stampings, and so arranged that they do not cross the line of any stray fields, which would set up eddy currents in them.

We must now turn our attention to the secondary winding, but before dealing with this part in detail, a note on the question of the ratio of transformation would not be out of place. Theoretically, the ratio of the turns of an intervalve transformer should equal the square root of the ratio of the secondary load to primary outside impedance. This, however, does not work out in practice, as many difficulties present themselves. Thus, we can only determine the ratio by approximate formulæ which have been founded on practical experience. A good formula for the purpose is—

$$\text{T.R.} = 250{,}000/\text{V.P.}$$

where T.R. = turns ratio,

V.P. = anode impedance of valve to be connected to primary.

The secondary winding of the transformer should in no way unbalance or distort the effects in the primary or iron core. It has a larger number of turns than the primary, as a "step-up" effect in voltage is required, so that we have now to deal with a winding having an inductance many times greater than that of the primary, and whose capacity, owing to the mean diameter of the turns being greater, is comparatively large also. It follows, therefore, that the natural wavelength is large and the frequency low, as nearly as possible within the range of audibility. It is essential that the capacity be reduced, as the natural frequency of the coil must be brought outside the limits of audibility. No reduction of inductance can be made to obtain this end.

Unless the natural frequency of the coil is brought outside the audible limits, considerable booming will take place on any signal having a frequency the same as that of the coil. The capacity of such a winding may be decreased by increasing the number of layers of wire in the coil by winding in sections, or by increasing the distance between the layers, or by using some form of insulation having a low specific inductive capacity between the layers.

From a mechanical point of view, the wires in the secondary windings should be held in spaced relation to each other by some non-resonating material, and this remark also applies to the two main windings themselves.

These few notes will show the technical difficulties which are encountered in intervalve transformer design and, it is hoped, will help engineers desirous of turning their energies in this direction.

A Neglected Instrument of Precision.

The Necessity of a Close Study of Language.

By T. J. MONAGHAN, B.Sc. (Eng.) Hons., M.I.E.E.

ENGINEERING is neither a science nor an art, but a combination of the two; it consists of collecting and classifying facts about those unvarying successions we call the laws of nature, and applying the knowledge so obtained to practical problems. The engineer finds out how things can be done, then does them as they should be done.

Science is based upon experiment, and fundamentally experiment is measurement; the engineer's aim is to carry principles into practice efficiently, and efficiency is rooted in measurement. The two-fold demand for means of measurement, in investigation and in execution, is liberally catered for to-day; the range of choice of instruments for almost every useful measurement is wide; we have available delicate, sensitive apparatus for the laboratory, robust, almost foolproof appliances for industrial use. The modern engineer prides himself on appreciating to the full the importance of accurate measurements, yet too often he neglects the most vital measurement of all, for who among us "always measures the length and breadth of his assertions"?

Now every assertion has two aspects, the thoughts upon which it is founded, and the way in which these thoughts are expressed. No engineer will admit for a moment that he is not a clear thinker, yet it cannot be denied that some engineers neglect to acquire the art of writing a clear, well-balanced statement. The mental attitude of such a delinquent appears to be: "I have done the work and have no time to waste in pretty writing about it. I would rather not write anything, but if I must write, then I will spend only so much time on it as is absolutely essential for putting the results on paper. Then I will get on with my real work." This attitude is quite a wrong one. In the interests of efficiency it is the duty of the engineer to communicate to his fellows any special knowledge he has acquired, for an engineering problem is not completely solved until the solution is available for the world at large; much useful knowledge fails to be circulated because its possessors decline to grapple with the pen. Again, an engineer is often called upon to give the benefit of his technical knowledge to non-technical people; he should, of course, give them the full benefit of his knowledge, and the extent to which he does so depends very largely upon the way in which his report marshalls the facts, draws up the arguments, and states his conclusions. Ability to express one's views and ideas effectively, and to drive home one's arguments convincingly, is, then, so important that a plea may well be urged for the closer study by the engineer of that most flexible and potent instrument for the measurement of assertions—the English language.

A close study of language is essential to all whose work calls for precision of statement. Language is a most important, if, indeed, not an indispensable, instrument of thought; who does not know that uncomfortable condition when ideas he cannot put into words float elusively in the mind, and the feeling of grasp and possession acquired when the ideas are captured by finding for them appropriate words? Language is the sole vehicle for the communication of all but the simplest ideas; through it we are indeed heirs to all the ages; by it we may attain some small share of immortality, if, perchance, records of our work lessen the labours of those who shall take up after us the search for engineering truths.

Language is used to convey our thoughts, and for our present purpose may be defined as combinations of words; we must consider, then, first words, and afterwards their combinations.

Words in many respects resemble money. Money is a medium of exchange; its value as money is exactly what we agree it shall have, and if the parties to a transaction involving a transfer of money have different ideas as to its worth, then before they can do business they must agree upon a rate of exchange. Now words are the currency of ideas, and there is often a rate of exchange between users of words, though unfortunately this may not be appreciated by the parties to the transaction. To the user a word means what *he* intends it to mean, to the hearer the word means what *he* thinks it means, and unless user and hearer attach the same significance to the word, confusion arises. The careful

writer will, therefore, endeavour to ensure that the words he uses to carry his ideas shall convey them without modification, by using ordinary words in their generally accepted senses, and where, as often happens, quite ordinary words have several meanings, he will make clear which of them he has in mind. Cultivate the habit of looking up in a good dictionary all words of whose meaning you are at all doubtful, and soon you will be referring to it for words the meanings of which you once were sure you knew perfectly. Technical terms are intended to express quite definite ideas, but with the rapid growth of scientific knowledge technical language is falling into arrears, and, as a result, some technical terms have more than one meaning, so that almost as much care is needed here as with ordinary language, to see that your words carry your exact meanings. You can take a horse to water but you cannot make him drink, but if you don't take him to the water he won't have a chance of drinking; so that while you cannot ensure that your readers will grasp your meaning, you can at least ensure that the responsibility for failure to do so does not rest on you.

Alive to the importance of selecting his words carefully, the writer now enters upon the task of forming them into proper combinations. We are not concerned here with correctness of grammatical structure, of which a reasonable standard is relatively easy to attain, but with combinations of words in a wider sense. What is the real aim of all professional writing? Surely it is to carry conviction, to bring others round to our point of view, to persuade them to adopt the course we advocate; in short, to carry our point?

If we are to have any opportunity of doing this, what we write must be read, and being read must be understood. To ensure that it shall be read we must make it interesting; to ensure that it shall be understood we must make it clear. But while different people may be interested in the same thing, they are not all interested in the same aspects of it. The technician is interested in why a thing happens, how a result may be attained, how a difficulty may be overcome; the business man is interested in when a thing can be done, how much it will cost and how much it will save; so that it is necessary first to ascertain the view point of the particular audience we wish to convince. Having decided the general method of treatment which will be best for our special appeal, the next point to decide is the method of approach. If the information we have to convey is such as the audience is prepared to believe if clearly laid before it, then an orderly straightforward method of explanation is best. But it often happens that our findings are likely to be unwelcome to the audience, and considerable care is necessary in such cases. The obnoxious statements should not be made until arguments have been adduced that will convince the audience that the statements must be accepted. When dealing with sceptical audiences there is a natural temptation to let oneself go in demolishing the opposition, but it is wiser merely to show that we are prepared to meet all objections to our arguments; our object is not to compel our audience to admit that its former views were wrong, but to persuade it to admit that our view is correct.

Facility in writing is not to be attained without diligent practice and the cultivation of a spirt of severe self-criticism. No matter how skilful one may be, it is useful in all important cases, if time permits, to put the completed report aside for a while, and to come back to it when the enthusiasm of composition has evaporated. If you do not find much that you will wish to amend, many obscurities where you thought all was crystal clear, you are indeed gifted.

And always remember that what your readers do not understand is useless. There are varieties in methods of expression. There is that of which no man can grasp the author's meaning, that from which an intelligent and persevering reader can unravel some shreds of the author's meaning and that the proud author of which can boldly "deny the ingenuity of man to give to our words any other meaning than that which we ourselves intend them to express." Strive diligently after this last!

Indian Electrical Trade.

(From our Indian Correspondent.)

For the last two or three years Indian electrical trade has shown a steady decline. During the first quarter of 1925, however, a slight tendency towards improvement was recorded. The imports of electrical machinery during January, February, and March amounted to 62½ lacs, as against 60 lacs during the corresponding period of the preceding year. In the case of electrical instruments and apparatus, an increase has also been recorded, the imports amounting to 62 lacs, as against 58 lacs in the first quarter of 1924, an increase of 7 per cent. In electrical machinery, a large increase of 11 lacs was recorded under miscellaneous kinds, while all other heads considerably declined, leaving a balance on the total of 2½ lacs of increase. Control and switchgear declined from 12½ to 11 lacs, generators and dynamos from 8 to 7 lacs, and meters from 14½ to 11½ lacs. The share of the United Kingdom in the total was 54½ lacs, as against 48½ lacs, an increase of 6 lacs. The United States also increased her share from 5 to 5½ lacs, but Germany's share, which is already small, declined from 1½ lacs to 1 lac.

In the trade in electrical instruments the share of the United Kingdom increased from 44 lacs to 46 lacs, not an insignificant improvement considering that during 1924 the imports from the United Kingdom considerably decreased. The share of the United States remained almost stationary at about 4½ lacs, but the share of Germany actually increased from 4 to 6 lacs The imports of fans remained unchanged at about 9 lacs, but wire and cables increased from 21 to 28 lacs. The share of the United Kingdom in the latter case increased from 20 to 23 lacs, and in fans from 4 lacs to a little over 4½ lacs.

Socialism and Electricity.—Alderman Herbert Morrison, L.C.C., spoke on the subject of "Socialism and Electricity" at a meeting held recently under the auspices of the Hackney Independent Labour Party. In the course of his speech the alderman said that it was a vital and urgent question both in the Parliamentary and municipal fields whether British electricity supply and distribution was to be a public service run for the public good, or whether it was to be a private monopoly run for the purpose of securing profits to individuals, rather than securing prosperity to the people as a whole. The greater part of London was going to be handed over to a private electrical trust until 1971, but he hoped that before that time came there would be a Socialist Government in office again, with a Socialist Parliament behind it, and that they would undo the contract now being made by the present Government and the L.C.C., with private interests. In Greater London, the municipal supply had proved itself to be more enterprising and more economical than private ownership. They were still in the habit of saying that electricity was in its infancy. It had got beyond its infancy: it was being used for an increasing variety of purposes—not as an experiment, but as a practical part of everyday industrial life, and increasingly in domestic life.

Concrete Hardening and Waterproofing Compound.—We have received some interesting particulars concerning "Cemenfortis," a product of the Harvie Corporation, Ltd. It is a liquid chemical compound used for the hardening and waterproofing of concrete by virtue of its property of effecting complete combination of the concrete constituents. It is added to the gauging water, and carried through the mass of mixed concrete regardless of a variation in the size of the component materials. It combines chemically with the free lime of the cement, and with the particles of silica in the aggregate, forming hydrated calcic-silicate; and the voids in ordinary cement are filled with this cement solution. At the same time it is said to crystallise, forming a hard insoluble mass. The chemical combination brought about renders the concrete extremely hard and impervious to water under pressure. After adding "Cemenfortis" to cement, mortar and concrete, they become "fatty" compounds, giving a firm and yet cohesive workable mass ideal for trowelling. Another useful property of this compound is that it prevents concrete from freezing at the ordinary freezing temperature and it is claimed that it will permit of perfect hydration at 13 deg. F. This useful substance has been applied to many uses, including the construction of concrete water tanks and the treatment of damp walls.

The International E.H.P. Conference.

By R. BORLASE MATTHEWS, Wh.Ex., A.M.Inst.C.E., M.I.E.E., F.R.Ae.S.

(*Continued from page* 1009. Vol. XCVI.)

The Papers.

This biennial conference is taken very seriously, and a large number of papers are dealt with. Together with reports—they numbered over 112—a marked increase on the 89 originally anticipated. They were discussed in three main groups: (I) The production and transformation of energy; (II) The construction and insulation of transmission lines; (III) The development of the transmission.

A conference such as this affords an opportunity for reviewing the general situation at the present day and also for estimating future progress. It is here proposed to consider the more important points raised in the papers, in the order given above.

Group (I) was subdivided as follows:—Boilers; construction of alternators; interconnection of power stations; operation in parallel; oils for transformers and switches; testing of generators and transformers; substations.

2 1 3

1, The President, M. Doumergue; 2, M. Legouez (President of the Conference); 3, Dr. C. O. Mailloux (President of Honour of the Conference).

On the left in the second row are the British delegates, Messrs. S. C. Bartholomew, H. E. Midgley, A. Page, P. V. Hunter, W. B. Woodhouse (Vice-president), and R. B. Matthews.

Reception of the Principal Delegates by the President of the French Republic.

Boiler-house Matters.—As the president of the first section remarked in the summarised report of its work, boiler-house matters would seem a little outside the scope of the section; however, the papers presented by Mr. E. Lafon and Dr. W. Lulofs were of some importance in this connection. A plea was made for the chimney as against the blower, it being claimed that present-day design could increase the efficiency by as much as 50 per cent. Dr. Lulofs gave the results of his experience with powdered fuel. He prefers the unit system (one boiler, one powdering plant) as compared with the American practice of a central system. One advantage is that the mills can take hot air from between the double walls of the combustion chamber; altogether it is claimed that as efficient results can be obtained from the unit system as from the central system, while the former has many more advantages.

The construction of alternators was examined in three papers, which gave the latest phases of technical construction (Messrs. E. Roth, M. Langlois, and E. Wilczek). Mr. Roth pointed out the necessity, in the case of turbo-alternators feeding lines having a large capacity, for designing the armature reaction to be sufficiently weak to assure stability of running under all conditions of operation and to avoid self-excitation. In order to retain the instantaneous value of the short-circuit current within permissible limits, the armature leakage must be artificially increased, *e.g.*, by leakage slots. Langlois described in detail the design of a 15,000-kW alternator for operation at either 25 or 50 cycles in a Paris station, which supplies at both frequencies. This was accomplished by connecting the machine so that it could either be used as a 4-pole or a 2-pole unit. However, the problem did not end at this point, and the author gave further particulars of the solution. Dr. Wilczek gave some results obtained by the firm of Ganz, of Budapest, in the construction of high-speed alternators (3,000 r.p.m.), wherein an attempt had been made to greatly improve the characteristics of true sinusoidal wave-form, overload, single-phase short-circuit, &c.

Interconnection of Networks and Parallel Working.—Sartori drew attention to the work of Prof. Donati, of Bologna University, in applying the principle of reciprocity to the calculation and operation of large networks. This work should do much to facilitate the mathematical analysis of the current distribution in the large distribution systems that have come into being of late years.

The problem of the exchange of energy between linked stations was dealt with in several papers, which caused considerable discussion. Unfortunately the problem seems to be as yet a long way from complete solution. The principal points brought forward were: The calculations of the networks; the phenomena of auto-excitation; and selective protection against short-circuits. In connection with the question as to the employment of inductances, the opinion seemed to prevail that they should be eliminated and replaced by fuses, for the latter assure a security at least as great and are much cheaper. However, it appeared that the use of inductances between machines should be retained. Another interesting statement was that it was now feasible to connect networks of different frequencies. This possibility is, of course, of great interest to those countries where the frequency is not as yet standardised.

(*To be continued.*)

The World Power Conference of 1924.

A Review of the "Transactions."

SUFFICIENT time has probably not yet elapsed for a general appreciation to be formed of the far-reaching importance of the first World Power Conference, which was held in connection with the British Empire Exhibition at Wembley in June and July, 1924. There can be no question, however, that apart from their great number, the exhaustive character of the papers submitted to the Conference cannot fail to have an important bearing upon future electrical progress. It is therefore a matter of the highest importance that the work of the Conference has been collated for the benefit of future generations in the form of four volumes, some idea of the extent of which may be gathered from the fact that, apart from a large number of double sheets of illustrations and tabular statements, they comprise no fewer than 6,423 pages, and that not only is the full text of the various papers given, but also a verbatim report of the ensuing discussions.*

From this it will be appreciated that the task of reviewing the "Transactions," as they are officially styled, is by no means an easy one, and, in view of the limitations of space, it will be impossible for us to do more than briefly summarise the various volumes, drawing attention to some features of each that appear to be of particular importance.

The World's Resources.

Volume 1, which is devoted to the subject of "The Power Resources of the World—Available and Utilised," opens with a preface by the Organising Director of the Conference, Mr. D. N. Dunlop, in which he pays a tribute to the Council of the British Electrical and Allied Manufacturers' Association—which by ensuring the necessary financial support made the far from easy task of organising a World Conference possible—and to the distinguished scientists, engineers, and leaders in all parts of the globe who, by their efforts, both directly and indirectly, assisted in its unquestionable success. From the Preface we may perhaps jump to a reference to the Appendix, which gives full particulars of the opening ceremony by the Prince of Wales, the speeches at the inaugural banquet, the names of the members of all the Organising Councils and Committees, and a complete list of the delegates to, and members of, the Conference. This indicates that, apart from Great Britain, delegates were present from no fewer than a dozen different parts of the British Empire, and from twenty-nine foreign countries—literally from "China to Peru." Thus, in view of the exhaustive character of the work—and here a tribute may be paid to those who have been responsible for the editing of the "Transactions," necessitating as it did a technical knowledge of many languages, as well as to the printers and publishers—it would be ungracious to criticise, even if such were necessary.

Turning now to the papers included in Vol. I, these, as already indicated, all relate to the Power Resources of the World. There is hardly a country or State that is not dealt with, and while a good deal of space is devoted to hydro-electrical resources, the equally important ones, for many countries, of coal, lignite, peat, mineral oil, and power alcohol, are all treated in a manner, the exhaustive character of which has never previously been attained. Although it is almost invidious to particularise, we regard the information given in the papers referring to the power resources of Australia, India, Russia, Esthonia, and several others as yet not fully-developed countries as extremely valuable as affording much information that may prove useful to British electrical engineering and financing undertakings in the quest for new opportunities of enterprise. In the case of Esthonia, in a written contribution to the discussion, Mr. Alfred Dickinson, of Birmingham, considers that that country possesses some of the most important possibilities for water-power development in Europe, and, after an inspection of the site, he expresses the opinion that the scheme for the establishment of hydro-electric plant at Narwa, capable of yielding a continuous minimum of 60,000 h.p., is sound from both the engineering and the commercial aspects.

The Production of Energy.

The second volume is allotted to the papers submitted under the comprehensive headings of "Water Power Production," "Preparation of Fuels," and "Steam Power Production," the subjects being dealt with from all aspects—physical, technical, and financial. In the first category there are no fewer than about 42 papers, grouped into sub-divisions of General, Civil, and Mechanical Engineering and Operation. Every aspect of the subject is dealt with by the experts of all the principal countries of the world, thus affording in a compact form information as to the latest practice in hydro-electrotechnics that cannot fail to be of material value to all interested in this class of work. Special attention may be drawn to the exhaustive papers by Dr. H. J. Acres, the chief hydraulic engineer of the Hydro-Electric Power Commission of Ontario, on "The Generation of Hydro-Electric Power in Canada," that of Mr. A. Westerlind, the director of the Swedish Bureau of Hydraulic Construction, on "Recent Practice in Swedish Water Power Engineering," and that of Ing. L. Mangiagalli on "Dam Construction in Italy."

In a written contribution to the discussion on Water Power Production, Col. B. C. Battye, superintending engineer of the Punjab Hydro-Electric Circle, points out that it has been the custom for many years in India to use the expression "cusec" for cubic-feet-per-second as the unit of flow, and suggests that this should be made an international unit—at least among those nations using foot-pound-second units—and also that the unit of storage for power purposes be standardised in the future as a "cusec-day." In numerous reports submitted to the Conference, all sorts of different storage units were quoted, from gallons to cubic feet, acre-feet, cubic metres, &c., and in this connection we may venture the suggestion that prior to the next Conference a schedule of all these, and their equivalents in both metric and English measures, might be prepared for circulation among the various National Committees, so that in the preparation of the papers a uniform basis of dimensions and quantities might be adhered to.

The second section of Vol. II deals with "The Preparation and Utilisation of Fuels," this being divided into a trio of sub-sections—"Fuels Generally and Coal," "Preparation of Fuels," and "Utilisation of Fuels." In the first category coal takes a leading position, and in view of its importance from the British industrial point of view it is not unnatural to find a larger proportion of papers by British experts than is the case in the hydro-electric division. The subject is dealt with in the usual exhaustive manner, it being made clear that everything is being done to conserve the known coal resources of the world by utilising them in the most efficient manner. In the section dealing with the Preparation of Fuels, in addition to coal, attention is devoted to peat, shale oil, and the utilisation of wood waste, the latter having assumed considerable importance in such countries as Sweden. In the Fuel Utilisation section, the principal subjects dealt with are those of the use of coke and pulverised coal for the firing of steam boilers.

The concluding portion of this volume is allotted to

*The *Transactions* of the First World Power Conference. Four volumes. London: Percy Lund, Humphries & Co., Ltd. Price £12, or £3 10s. per volume. (Index Vol. £2 net.)

the papers on the subject of Steam Generation and Utilisation. It is with regret that we can do no more than point out that they deal with the latest steam boiler, turbine, and engine practice in all parts of the world, the information making it clear that much useful work is being done in the direction of utilising steam at very much higher pressures than has hitherto been the rule.

Internal-combustion Engines and Power Transmission.

Various branches of the Conference's work are embraced in Volume III. The first is that of "Internal Combustion Engines," in which the progress of Diesel-engine design and construction, particularly in Italy, Sweden, and Germany, is dealt with at great length. One paper also deals with large gas engines—a branch of power engineering to which great attention is being devoted in Germany, whose experts claim that they are able to turn out gas-operated engines for central-station work that show a financial economy over steam turbines. In a subsequent section are four papers dealing with various aspects of gas for power and illuminating purposes, while under the omnibus heading of "Power from Other Sources" are several papers relating to the use of wind motors, especially in Denmark and Holland, to alcohol as a source of power, and to the existence and use of natural steam in Italy.

The interest of electrical engineers in this volume will, however, be mainly centred on the three subdivisions of "Power Transmission and Distribution," "Power Station and Transmission Lines," and "Cables and High-voltage Direct-current Systems." There are close upon fifty papers on these subjects, in the course of which modern practice in all the principal countries of the world is set out in full detail. Special attention may be drawn to the great electrical development which is apparently taking place in Soviet Russia, despite the fact that international trading relations with that country have not, since the war and the subsequent political upheaval, been re-established; to the papers on the parallel working of generating stations in Holland and Italy, and to high-voltage transmission progress in France, Italy, and the United States.

M. G. Darrieus, the engineer to the Compagnie Electro-Mecanique, of Paris, in a written contribution to the discussion on the paper by Messrs. J. S. and W. E. Highfield on "High-Voltage Direct-Current Generation and Distribution of Electrical Energy," which appears in this section, and which includes a description of the "transverter" jointly invented by Messrs. J. E. Calverley and W. E. Highfield, points out that the system of conversion adopted in the transverter was invented more than twenty-five years ago, and that a number of machines have been built on this principle, some of them having been working quite recently on the French Northern Railway and in certain of the Paris districts. M. Darrieus, however, adds that this does not detract from the great credit due to Messrs. Calverley and Highfield for overcoming considerable difficulties, and accomplishing the improvement of the crude apparatus of 1898 into the powerful high-pressure machine we all admire to-day.

The remaining portion of Volume III is devoted to "Research," "Standardisation," and "Illumination." Although in the first of these divisions only four papers were presented, dealing mainly with what is being done in Austria and Sweden, they gave rise to one of the longest and most interesting discussions. In the case of "Standardisation," accounts are given of the position in Austria, the Dutch East Indies, Germany, Norway, and Sweden, while two papers deal with the question of international standardisation. In the "Illumination" section the principal contribution was that of Mr. C. W. Sully, presented on behalf of the Electric Lamp Manufacturers' Association of Great Britain.

Power in Industry and Transport, Economics, &c.

The final volume of the "Transactions" (No. IV), as might be expected, is devoted to a wide range of subjects. First, there is a collection of no fewer than 29 papers on "Power in Industry," one of the most exhaustive of which is the series collated by Mr. P. T. Davies, A.M.I.E.E., the president of the Canadian Electrical Association; it deals most thoroughly with all the varied applications of electric power in the Dominion from the largest industry down to domestic requirements. Many of the papers, while dealing mainly with the use of electricity in agriculture and rural industries in Denmark, Germany, Holland, and Norway, and other countries, also refer to other industries, and are consequently included in this section. We mention this, as otherwise it might appear that, with only four papers, the "Power in Domestic Uses and Agriculture" section had been somewhat neglected. Two of the papers in this category—those by Dr. H. Wallem, of the Siemens-Schuckertwerke, Berlin, and Mr. R. Borlase Matthews, M.I.E.E., both of whom have made a special study of electro-farming—are especially worthy of mention. Half-a-dozen papers record the progress made in "Electro-Chemistry" in Austria, Scotland, Norway, Sweden, and the United States, while there are four devoted to "Electro-Metallurgy." That veteran, Col. R. E. Crompton, figures as the author of one of the five papers on "Power for Road and Air Transport," after which we come to the "Power for Rail Transport" section, in which, in view of the importance of the subject, it is not surprising to find no less than fourteen papers, notable contributions being those of Mr. Roger T. Smith on "Electric Railways in Great Britain," and Sir Philip Dawson on "The Financial Aspects of Main Line Electrification." Other authorities deal with the progress of electric railways in Austria, Java, Germany, Holland, Hungary, Italy, Norway, Sweden, and the United States; the only country which has made great strides in railway electrification work, but of which no detailed information was presented to the Conference, is Switzerland, the only reference thereto being in the "Water Utilisation" section.

Passing over the "Power for Water Transport" division of the volume, in which out of the fifteen papers presented only one—that read by Mr. W. J. Belsey, of the British Thomson-Houston Co., Ltd., on "Electric Transmission of Power for Propelling Machinery"—calls for mention, we come to the record of the work done in what we regard as one of the important sections of the Conference—"The Economic Aspect of Power Resources." The subject is treated from many angles and also from the point of view of various countries, thus providing much matter for careful study by all—even Royal Commissions and Government Committees—interested in the extension of electricity supply in the United Kingdom.

It was perhaps somewhat daring of a Belgian engineer—M. A. Heinemann, of Brussels—to present a paper on "Electricity in the Region of London," but it is always well "to see ourselves as others see us," and the author's remark that the cost of energy supply in the County of London in 1921 was more than double that of the average in the United States, should not pass unnoticed. Two other important papers in this section were that by Mr. George Balfour, M.P., M.I.E.E., on "Financial Considerations of Hydro-Electric Development, with special reference to Great Britain," and that by Major-General Sir Philip A. M. Nash on "The Economics of World Power." As indicating the outstretching character of the Conference, it was satisfactory to find that the Labour movement was embraced in it, Mr. J. P. Noonan, the president of the International Brotherhood of Electrical Workers, contributing a paper on "Labour's Part in Power Production," while equally useful were the contributions on "Industrial Welfare and Vocational Psychology" emanating from Austria and Holland. In the Publicity Section, Mr. J. W. Beauchamp, M.I.E.E., the director of the British Electrical Development Association, dealt at length with the object and work of that body, the subject eliciting in the subsequent discussion some useful information regarding American methods.

The last division of the volume is by no means the least important, dealing as it does with the question of "Technical and Commercial Education," and a study of the various papers can be commended not only to the managers of large electrical engineering undertakings, but to education authorities in all parts of the United Kingdom, and particularly to the principals of polytechnics and technical institutes. In particular we would refer to the paper on "Co-operation of Industry with Technical Schools," by Prof. Dr. Conrad Matschoss, director of the German Society of Engineers, Berlin.

Conclusion.

As to the value of the Conference, we cannot do better than quote a few of the remarks made by Mr. O. C. Merrill, the Executive Secretary of the United States Federal Power Commission, at the closing ceremony. "What we have accomplished here," said Mr. Merrill, "I consider too great both in its amount and in its value to be encompassed within the terms of any resolution that we would be prepared to discuss to-day. We have brought together here the leading technical experts from all over the world, and we have brought together in the papers presented to the Conference the greatest contribution, in my judgment, on the subject of power that has ever been brought together—a series of contributions that will serve as text books for engineers for many years to come."

Mention has already been made of the numerous plates of illustrations and maps and sheets of tabular information which, together with the large number of illustrations in the text pages, add materially to the value of the Transactions, inasmuch as some of these were not included in the papers at the time they were read or presented. The Transactions are also of value by reason of the fact that in response to a general invitation at the Conference many who were unable owing to time and other reasons to add their quota to the discussions have since submitted their remarks and many helpful suggestions to the organising secretary, who has included them in their respective places.

Each volume is provided with its own index of the titles and names of the authors of the papers, while to render them of value to foreign as well as to English-speaking engineers, a *résumé* in French follows all papers in English and, *vice versa*, an English *résumé* is given of all papers in French. In addition, many of the Italian papers have been completely translated into English. Thus, almost everything possible has been done to render the information contained in the Transactions available to engineers throughout the whole world, no matter what their nationality. There is no doubt that the language difficulty was a serious hindrance to securing the full advantage of the first Conference, and following the result of the recent Congress in Paris, it may be that in the case of future Conferences, Esperanto will become the official language not only for the papers but for the discussions.

At the request of many subscribers, a complete and comprehensive index to the Transactions has been prepared, and is available at a cost of £2 net. It consists of a volume of 600 pages, uniform in size with those of the Transactions, and comprises no fewer than 40,000 references, so that notwithstanding the variety of the matters touched upon in the papers and the subsequent discussion, it will be possible by means of the index volume quickly to locate any desired information.

The cost of the four volumes is £12. The publishers are also prepared to offer each one singly, and no doubt this will be of service to those who are only interested in certain aspects of power development and utilisation. A suggestion that we have to make, although perhaps a minor one, is that the year "1924," which is given on the title page of each volume, might also usefully be added to the gold lettering on the binding.

The International Railway Congress.

A Review of some of the Electrical Features.

The tenth International Railway Congress was opened in London by H.R.H. the Duke of York on June 22nd, and was continued until July 2nd, when the delegates left London and visited various parts of the country, including Darlington, where the centenary celebrations of the introduction of steam railways by George Stephenson were held. The International Railway Congress Association was formed in 1885 and holds its congresses at intervals of a few years in various countries; the last held in Great Britain was 30 years ago. The Association is composed of State railway administrations and has its headquarters at Brussels; the membership now consists of 235 administrations, representing 300,000 miles of line.

The Congress was divided into five sections, one of which dealt with electric locomotives, and three sessions were devoted to the consideration of reports from various parts of the world. The various sectional meetings were held in the buildings of the Institutions of Civil and Mechanical Engineers, the reports presented for discussion numbering over 50. The delegates numbered over 800 and came from every important country in the world, with the exception of Russia and Germany. Among the social events were a banquet at the Crystal Palace on June 25th, a reception on behalf of the British Government at Lancaster House, London—where the guests were received by the Minister of Transport (Col. W. W. Ashley) and Mrs. Ashley—and a concert at the Queen's Hall on June 26th, in addition to numerous excursions to works and places of interest in and around London, Canterbury Cathedral, Oxford, Brighton, and elsewhere. Subsequently the delegates were to visit Leeds, Harrogate, Darlington, Edinburgh, Glasgow and the Trossachs.

The Duke of York was thanked for opening the Congress by M. Foulon (president of the Permanent Commission of the Congress), and the Congress was addressed by the Minister of Transport, who referred to the fact that electric traction was now being recognised as the most efficient method of dealing with the conveyance of millions of workers of the great cities of the world and, considered in relation to its application to long-distance trains, was a subject of the greatest interest at the present time.

The Congress was also welcomed by Viscount Churchill (chairman of the Great Western Railway Co., who was elected president of the Congress), and after the opening ceremony, delegates proceeded to Whitehall, where a wreath was placed at the foot of the Cenotaph.

The presidents of the five sections were respectively:—

Mr. E. F. C. Trench, engineer-in-chief of the London, Midland and Scottish Railway (Section 1; ways and works).

M. M. Weiss, engineer-in-chief of the Swiss Federal Railways (Section 2; locomotives and rolling stock, including electric locomotives).

M. du Castel, director of railways to the French Ministry of Public Works (Section 3; railway working).

Dr. J. H. Parmelee (United States), (Section 4; general railway questions).

Signor G. Semenza (Italy), (Section 5; light railways and colonial railways).

On June 24th and 25th, the various sections devoted themselves to the consideration of questions not connected particularly with electrical matters, and joint meetings of sections were held in cases where the particular matter under discussion was of interest to both. A matter of general interest was the practicability of the eight-hour day on railways, and resolutions were put forward in which the necessity for taking into consideration the special circumstances attaching to various railways was emphasised. After two days' discussion of the matter, however, no final decision was come to, and the discussion was resumed on the Thursday morning, when the matter was disposed of by the passing of a resolution which expressed the opinion that, after full statements by the representatives of the different countries, a rigid application of the eight-hour day was not possible.

Signalling: Electric Lighting.

On June 25th a great deal of attention was paid by Sections II and III to signals and signalling systems. The reporters on these subjects were:—Mr. W. H. Elliott, signal engineer to the New York and New Haven Central Railroad; Mr. W. J. Thorrowgood, signal and telegraph superintendent to the

Southern Railway, England; Mr. Carlo de Benedetti (chief signal engineer to the Italian State Railways), who dealt with Italy, Belgium, and Holland; Mr. T. Hard (Stockholm), who dealt with Denmark, Norway, and Sweden; and M. Laigle (Paris), who dealt with other countries. After discussing the position and colour of the light of fixed signals and similar matters it was recommended by the reporters that where electrical energy was available, its use should be substituted gradually for the oil lamps almost universally in use, preferably by using lamps with parallel filaments at the focus and comprising, for each main signal, one lamp lighted and another as a standby, with an indicator showing the extinction of each lamp and provision for the automatic lighting of the standby lamp. Lamps should be supplied with electricity from some source other than batteries of accumulators, even in the case of isolated signals.

Dealing with the track-circuit system of signalling, it was remarked that it was possible to work track circuits either by d.c. or a.c. on lines operating steam traction; alternating current cost more in the first instance, on account of the power transmission line, but it was less expensive to maintain on account of the absence of track and line batteries. Moreover, the a.c. track circuit was not affected by stray currents, which fact was of importance owing to the extension of inter-urban trolley lines, and the a.c. feeders which supplied the signals and track circuits could serve equally well for other uses, such as lighting a station, for example.

The applications of the automatic block, particularly in America and France, showed that this system completely met the requirements for working the traffic; it worked regularly and maintenance did not offer any special difficulties. The increased cost of labour during recent years, indeed, rendered the adoption of the automatic block system worthy of consideration from the point of view of economy not only in the equipment of new lines, but also for the transformation of the manual block system. The improvements that had been made in batteries and motors had rendered this operation easy by enabling the manual block signals to be retained.

The arguments in favour of the method of working with track normally open or track normally closed had been studied by the reporters, but they were of the opinion that the arguments either way were not sufficiently conclusive to enable a definite decision to be come to as to the advantages of the one system over the other. The main advantages of the closed track were greater safety and economy in maintenance, whilst the claim for the open track was reduced cost of installation. It was an account of the simplicity of the installation that the A.P.B. system, with track normally open, had been installed in America on single tracks, because this system enabled a large number of trains to be run.

In the course of the discussion on these reports, Mr. Thurrowgood expressed the opinion that a double-filament lamp was preferable to two single lamps, and he suggested one filament for ordinary use and one reserve filament having about 40 per cent. of the intensity of the ordinary filament. After further discussion, the paragraph in the reports relating to the substitution of electricity for oil in light signals, was modified to read as follows:—

"If suitable current is available, it might be advisable to substitute electric lighting gradually for the mineral-oil lamps almost universally in use; the technical measures on the systems which have adopted this method of lighting are in general that, in case of the lamp being extinguished, a standby and as far as possible a system of control shall be in operation."

Another suggestion made by the reporters was discussed, *viz.*, "Luminous signals having been brought to such a state of perfection as to give great efficiency and a great measure of safety, their use is to be recommended in areas in which an electricity supply is available, and particularly for use on lines worked by electric traction, in tunnels, in large stations, and on approaching stations." It was suggested by one of the French representatives that the wording of the above sentence was too strong, because the introduction of this system of signalling might, in certain circumstances, be very expensive. Another French delegate, on the other hand, spoke of the beneficial results which had followed the adoption of luminous signals and thought it advisable to consider the possibility of their use in those districts where electric power was obtainable, more especially on electrified lines.

The Banquet.

On the Thursday evening, June 25th, a banquet was given to the delegates at the Crystal Palace at which Sir Guy Granet (chairman of the Congress) presided, and was supported by Sir Philip Cunliffe-Lister (president of the Board of Trade), Lieut.-Col. Wilfred Ashley (Minister of Transport), and many other representatives of Government Departments and railways throughout the world, the company numbering some 1,500. There was nothing of direct electrical interest in the proceedings, the outstanding point being the emphasis laid upon the manner in which railways could develop the trade of a country and, by their inter-working, assist in the promotion of friendly relations between the nations of the world.

(*To be continued.*)

Business Notes.

Commercial and Industrial Developments, Business Changes, Trade Opportunities, New Publicity Literature, Liquidations and Failures.

The "Electrical Review" Index.—The Index for the last half-yearly volume of the ELECTRICAL REVIEW (January to June, 1925), will shortly be published. Copies will be forwarded post free to those requiring them for binding or for reference purposes, if they will make application to the Publisher, ELECTRICAL REVIEW, 4, Ludgate Hill, E.C.4.

Mullard Window Dressing.—We have received from the Mullard Radio Valve Co., Ltd., a picture of a window display at the premises of Mr. A. J. Selby, of Burton-on-Trent. This is a very effective piece of window dressing arranged with the aid of the company's publicity service.

Electrical Work at Wembley.—MESSRS. G. W. ROBINSON inform us that they have supplied the whole of the lighting equipment at the Burma Pavilion, for Messrs. Schweppes, Ltd., and are using similar reflectors to those used in the Ideal Home Exhibition gardens. These reflectors give an artificial sunlight effect. The firm has also supplied the whole of the water heating apparatus in this building, and has contributed to the flood lighting of the grounds. The large self-contained electric fountain, 6 ft. in diameter, which is fitted in the centre of the Australian Pavilion, was also provided by Messrs. Robinson, as well as the portable electric floor fountains at the Co-operative Wholesale Society's stand in the Palace of Industry and the fountain at the entrance of the Canadian Pacific Railway building.

Inquiries on Overseas Commercial Matters.—The Department of Overseas Trade desires to remind United Kingdom exporters requiring information on overseas commercial matters that it is always desirable to approach the Department rather than to write directly to the representative in the market concerned. Frequently the information desired is already available in the Department, and direct application to the Department thus results in the saving of much time. Where the information is not so available, the Department takes immediate steps to secure it and to forward it to the inquirer. It is particularly emphasised that the methods sometimes adopted of addressing the same inquiry simultaneously to the Department and its overseas officers leads to unnecessary duplication of work and to delay.

Staff Salaries at Glasgow.—The Glasgow Corporation Conditions of Service Committee, as an outcome of correspondence between the General Manager of the Electricity Department and the Electrical Power Engineers' Association, has decided that in cases of promotion under the schedule of salaries of the E.P.E.A., the increase in salary shall be made immediately, and not in three increments, as was the method in the original agreement with the E.P.E.A., and that this decision shall be given effect to in two cases submitted.

Radio Exhibition at Glasgow. — An exhibition of radio apparatus will be held in Glasgow in connection with the Housing and Health Exhibition which opens in the Kelvin Hall on September 23rd. The National Association of Radio Manufacturers and Traders is organising the exhibition, which will be all-British in its composition.

Electricity Workers' Wages.—In a recent letter to its constituents the District Industrial Council for the Electricity Supply Industry (West Midlands area) stated that in consequence of changes in the average cost of living index figures there would be a reduction of ½d. per hour in the wages of adult employés as from July 1st; and also a corresponding decrease in the pay of youths and apprentices.

E.D.A. Activities.—In the latest pamphlet published by the British Electrical Development Association the dangers of dust are emphasised and it is pointed out that sweeping and beating carpets are very insanitary methods of cleaning them. The obvious alternative—an electric vacuum cleaner—is suggested.

An Eiffel Tower Advertisement.—A striking departure in the realm of advertising is the lease for eighteen months of the Eiffel Tower by the French firm of motor-car manufacturers known as Citroen. The firm is now engaged in fitting the well-known tower with electric light cables for a gigantic illumination of the tower on a groundwork of electric stars. The word "Citröen" will be marked in red flames of light 1,000 feet in length. The top of the tower which is 1,000 feet high, will be crowned with a huge red light which will be flashed over Paris every night.—*Financial Times.*

An "Exide Service" Convention.—On June 23rd and 24th over 240 representatives of "Exide" battery service agents took part in a convention at Hendon. Such subjects as constant potential charging, the repair of celluloid batteries, and the new Home Office regulations applicable to battery-repair shops were dealt with by experts to the visitors' advantage and consequently to that of their customers.

Trade Mark Registration in Japan.—The Department of Overseas Trade informs us that in accordance with a new Japanese ordinance it is now possible to renew a "pre-earthquake" registration at any time upon payment of a small fee, although the original period laid down for such re-registration terminated on April 30th last. The amendment is therefore tantamount to an indefinite extension of the original period.

Trade Announcements.—The Sun Electrical Co., Ltd., states that all communications relative to its business in the Midland area should in future be addressed to the head office. The branch agency for Birmingham and district, held for several years by the County Engineering and Lighting Co., has been terminated.

The firm of Bastian & Allen, water heating specialists and manufacturers of the Bastian geyser, has now amalgamated with the Bastian Meter Co., Ltd., thus combining the two firms started by the late Mr. C. Orme Bastian. The central offices of the concern will be 58, Haymarket, S.W.1, and all correspondence should be addressed there.

Messrs. John M. Henderson & Co., Ltd., makers of hoisting and transporting machinery, have removed their London office to Amberley House, 12, Norfolk Street, Strand, W.C.2. Telephone: Central 8927. Telegrams: "Needreba, Estrand, London."

Messrs. Peter Brotherhood, Ltd., have opened a branch office at 324, Harrogate Road, Leeds, from which Mr. E. Markham will represent them in Yorkshire, Durham, Northumberland, and the Grimsby area.

The address of Walker Vehicles, Ltd., is now Clare House, Kingsway, W.C.2. Telephone: Gerrard 6954; telegrams: "Walkveco, Westcent, London."

Bankruptcy Proceedings.—W. R. Grigsby, electrical factor, 184, Grays Inn Road, W.C., trading as the Wenham Lighting Corporation.—The first meeting of creditors under this failure was held on June 23rd at Carey Street, W.C. The receiving order was made on the petition of Drake & Gorham Wholesale, Ltd. The Official Receiver reported that it appeared that debtor took over the business, which was insolvent at the time, paying the creditors a composition of 5s. in the £. After the armistice the debtor devoted most of his attention to the electrical side of the business, but he was unable to make a success of it. In 1924 he made a heavy loss on the sale of goods to Mr. J. W. Clark, who had secured a contract for lighting at Wembley. He entered into a partnership deed with that gentleman's wife, it being agreed that they should share the profits equally, and that he should supply Clark with goods for the contract in the usual way of business and allow him extended credit. Mr. Clark was, however, unable to pay for the goods supplied to him by the debtor. The latter had further stated that he had been held liable for goods supplied to Clark by the petitioning creditors, who obtained judgment on the ground that he was Clark's employer and as a result instituted those proceedings. A further cause of his trouble was that a traveller left his employ and started on his own account, taking away some of his customers. A private meeting of the creditors was held in April last, when an offer of a composition of 10s. in the £ was rejected and a deed of assignment was executed in favour of a trustee who had since employed the debtor as manager. No statement of affairs was lodged, but the debtor returned £1,300 as due to cash creditors, and a like amount to the trade; he valued his assets at £940 and attributes his failure to bad debts, depreciation of stock, and to the loss of the action brought by the petitioning creditors. Mr. E. H. Hawkins, I.A., 4 Charterhouse Square, E.C., was appointed trustee.

D. D. Rayner, 6, Wilson Street, Derby, engineer.—The public examination of this debtor was held on June 23rd at the Court House, Derby. The statement of affairs showed liabilities of £539, against assets of £101. It appeared that in 1919 debtor started trading on his own account as an electrical engineer, with borrowed capital. In conjunction with another he took premises in Duke Street, Derby, and in the first nine months between £4,000 and £5,000 was advanced by the gentleman who had lent debtor his capital, the idea being that a company should be formed. The company was floated in November, 1919, with £10,000 capital, debtor being appointed managing director, and during the latter end of the boom period the company was successful. In September, 1922, the debenture holders took possession, debtor continuing as manager for a year at £600 without commission. In September, 1923, his wife started business with debtor as manager, and electrical motors were assembled, the sum of £200 being borrowed by his wife from relatives, and £600 from debtor's sisters. In March, 1924, another gentleman provided £250 and became a limited partner. The examination was closed.

J. E. Cracknell, High Street, Manningtree, Essex, photographer and wireless supplies dealer.—The first meeting of the creditors of the above was fixed to be held on June 23rd at 9, Arcade Street, Ipswich. The statement of affairs showed gross liabilities of £499, of which £497 was unsecured, against net assets of £195, leaving a deficiency of £302. Debtor attended for his public examination at Colchester Bankruptcy Court on June 25th before Mr. Registrar Bridgeman. He stated that he commenced business in 1922 with a capital of £15, and £37 which he borrowed, and later took up the radio business. His trade last year averaged from £15 to £20 a week, on which the profit was 25 per cent. At the end of January last trade fell off and left him with heavy stock, the value of which declined. His expenses increased, and the more business he did the worse off he became financially. The examination was formally adjourned to July 13th.

Nathan Abraham Ludwin, trading as N. A. Ludwin & Co., export merchants, &c., 122, Bunhill Row, E.C.—The first meeting of creditors herein was held on June 25th at the London Bankruptcy Court before Mr. E. Parke, Official Receiver. The debtor was neither present nor represented, and it was stated that he was under remand on a charge of conspiracy. The Official Receiver reported that, according to the debtor's statements, he came to this country from Russia in 1914, and started business five years later on his own account. He took the Bunhill Row premises two years ago, and in April, 1924, being short of capital, his brother sent him £1,000 worth of electrical goods. The debtor roughly estimated his liabilities at £12,000, against assets valued at £800, and he attributed his failure, among other causes, to depreciation in the value of radio goods and trade depression. A resolution was passed for Mr. E. H. Hawkins, I.A., 4, Charterhouse Square, E.C., to act as trustee and administer the estate in bankruptcy. The following are creditors:—

	£		£
J. Flower	145	F. H. Palmer	447
Igranic Electric Co., Ltd. ...	488	A. J. Stevens & Co. (1914), Ltd.	314
L. A. McAllister	110		

J. A. Refoy, trading as the Varley Radio Co., 178, Ancona Road, Plumstead, S.E.18, Kent, dealer in radio apparatus.—The public examination of this debtor was held recently at the Court House, Greenwich. The statement of affairs showed liabilities of £1,119, against assets of £34. Debtor stated that he commenced business in partnership with another in October, 1922, but the partnership was dissolved in May, 1924. He took over the business, although he knew it was in financial difficulties, as he hoped to be able to pull it round. He removed to his present address and his wife advanced him considerable sums to carry on. He attributed his failure to bad management and bad trade. He stated that he made a guaranteed offer of 10s. in the £ to be paid by his wife, but this was not accepted. The examination was adjourned.

Radio Cash Stores, 371, Upper Street, Islington; also at Leeds and Nottingham.—The accounts under this failure, particulars of which appeared in our issue of June 12th (p. 931), show liabilities of £1,111 and no assets. The following are among the creditors:—

	£		£
Pressland Electric Supplies, Ltd.	126	H. Jacobi & Co., Ltd.	38
Holttmin & Green, Ltd.	38	South Wales Wireless Co., Ltd.	26
Nottingham City Council ...	91	W. Bullen	27
John Bull Radio Supplies Co. ...	20	A. Lee & Co.	66
J. R. Morris	21	Marconiphone Co., Ltd.	56
McLeod & McLeod	24	Wellington Electric	20
E. A. Wood	58	C. McIntosh & Co., Ltd. ...	26
Wholesale Fittings Co., Ltd. ...	25	Swansea Borough Council ...	39

J. R. Pattison, 15, Goldsmith Street, Nottingham, electrical supplies factor.—The first meeting of creditors was held on June 26th at the Official Receiver's offices, Nottingham. The statement of affairs showed gross liabilities of £2,707, of which £2,266 was expected to rank, against assets of £280, leaving a deficiency of £1,936. Debtor attributed his failure to buying on a falling market, bad debts, keen competition, and the pressure of creditors. The sales for the past year were estimated at £2,787, on which a gross profit of £437 had been made, while the working expenses totalled £436. Debtor became aware of his position in 1923, and for some time had been pressed by creditors. The matter was left with the Official Receiver as trustee of the estate.

The C. C. S. Trading Co., 30, Western Mail Chambers, Cardiff, electricians.—The first meeting of the creditors of the above was held on June 26th at Cardiff. No statement of affairs had been filed, and the failure was attributed to bad trade and heavy working expenses. The matter was left in the hands of the Official Receiver as trustee of the estate.

C. B. Maurice, cable suppliers, late of Windsor House, Victoria Street, S.W.—First meeting, July 7th; public examination, October 6th, both at Carey Street, W.C.

S. C. Rapson, C. L. Burrill, and A. J. Heffer (Suburban Electrical & Maintenance Co.), electricians, 2, Plough Yard, Shoreditch, E.—Trustee Mr. W. A. J. Osborne, Balfour House, Finsbury Park, E.C., appointed June 19th.

A. W. Bould, electrician, 29, High Street, Skipton.—Trustee, Mr. W. Durrance, Official Receiver, 12, Duke Street, Bradford, released June 17th.

C. K. Wallis, electrical engineer, 51, Mons Avenue, Bognor.—Trustee, Mr. G. H. Acheson, Official Receiver, 12a, Marlborough Place, Brighton, released June 18th.

H. P. Tucker, electrician, Empire Bungalow, Ellacombe, Torquay.—Trustee, Mr. S. V. Upham, 23, Fleet Street, Torquay, released May 27th.

G. E. Harris, plumber and electrical engineer, 14, North Street, Emsworth, Hants.—Trustee, Mr. H. B. Morris, 20, Pearl Buildings, Portsmouth; released June 4th.

E. Downing (lately carrying on business in co-partnership with E. J. Mills, as manufacturers of electrical conduit fittings and general electricians, at 143, Butts Road, Walsall), Osborne House, Regent Street, Willenhall.—First and final dividend of 13s. in the £, payable at the Official Receiver's office, 30, Lichfield Street, Wolverhampton.

E. W. J. WHITELOCK, electrical engineer, 4, Leagrave Road, and 7, Cheapside, Luton.—Trustee, Mr. T. Keens, 11, George Street West, Luton, released March 17th.

C. BINNS (United Electric Co.), electrical engineer, 55, Low Briggate, Shipley.—Last day for proofs for dividend, July 10th. Trustee, Mr. J. O. Morris, Official Receiver, 12, Duke Street, Bradford.

H. W. W. ALFORD, wireless engineer, 18, Goldsmith Street, and 261, High Street, Exeter.—First and final dividend of 1s. 10¾d. in the £, payable at the Official Receiver's offices, 67, High Street, Exeter.

J. E. BYRNE, electrical contractor, 3, Wells Yard, Waterworks Street, Kingston-upon-Hull.—First and final dividend of 2s. 2d. in the £, payable July 3rd, at the Official Receiver's office, 37, Scale Lane, Hull.

Company Liquidations.—IMPERIAL MOTOR INDUSTRIES, LTD., 11, Denmark Street, Charing Cross Road, W.C.2.—A meeting of the creditors of this company was held recently; the chair was occupied by Mr. T. J. Bond, of Messrs. Cole, Bond & Co., C.A. The chairman stated that the company had appointed him to act as liquidator in the voluntary liquidation of the company, in conjunction with Mr. C. Latham, of the Automobile Trades Guardian Association. A statement of affairs was submitted, as at June 4th, which disclosed liabilities of £39,440. The assets amounted to £16,839 from which had to be deducted £1,732 for preferential claims, leaving net assets of £15,107, or a deficiency, so far as the creditors were concerned, of £24,332. The company was formed in 1917 with an authorised capital of £4,000, all of which was issued for cash, and took over as a going concern an existing business. For the first three or four years of the company's existence reasonably good profits were made. The losses for the years to July 1922 and 1923, were considerable, but at July, 1924, although a loss was incurred, it was very substantially reduced, and the directors were hopeful that the corner had been turned. Mr. Bond added that the directors backed their optimism by loaning to the company large sums of money, in respect of which no debenture was taken, and subject to the voluntary liquidation going through, they were prepared to forego their interest on the amounts loaned as from July, 1922. Since their appointment, the liquidators had continued to carry on the business on a somewhat modified basis in the hope of being able later to dispose of it as a whole.

It was decided to confirm the voluntary liquidation of the company, with the present liquidators, and an advisory committee, consisting of representatives of Lodge Plugs, Ltd., Three Star Accumulators, Ltd. Tangyes, Ltd., Acme Electrical, Ltd., and Rankin Bros., was appointed.

The following are creditors:—

	£		£
Lodge Plugs, Ltd.	551	Heilbronn, Felix	130
Three Star Accumulators, Ltd. ...	526	General Electric Co., Ltd. ...	121
Robinhood Engineering Works...	476	Autovac Mfg. Co.	121
Tangyes, Ltd.	418	Sphinx Sparking Plug Co., Ltd.	106
Acme Electrical, Ltd.	369	Sun Electrical Co., Ltd.	82
Vandervell, C. A., & Co., Ltd....	272	British Thomson-Houston Co., Ltd.	51
Obermer, S.	218		
Champion Sparking Plug Co. ...	209	Park Bros.	71
Powell & Hanmer, Ltd.	198	Butlers, Ltd.	66
Lucas, Jos., Ltd.	170	Lake & Elliott, Ltd.	60
Stephens, R., & Sons, ...	168	Benjamin Electric, Ltd.	55

BROTHERTON EDISWAN TUBES & CONDUITS, LTD.—A meeting of members is called for July 27th at the Victoria Hotel, Wolverhampton, to hear an account of the winding up from the liquidator, Mr. R. H. Johnston.

KEARNEY HIGH-SPEED RAILWAY CO., LTD.—First meeting of creditors and contributories, July 7th, at Carey Street, W.C.

Private Arrangements. — BASIL EDWARD CROW, trading as Crow, Toogood & Co., electrical and wireless supplier, 18, Charing Cross Road, W.C.2, and at Eastbourne and Bournemouth.—A meeting of the creditors of the above was held on June 23rd, at the London Chamber of Commerce when Mr. P. Houstoun, who represented one of the principal creditors, was elected to the chair. Mr. W. M. Whyte reported that a deed of assignment had already been executed by the debtor. The latter commenced business in 1920, and at the outset a fair profit was made. During 1924, however, trade was very bad and at the end of that year there was a deficiency of £2,180. The debtor then borrowed sums aggregating £850, which were put into the business in the hope that trade would revive. Unfortunately, that had not been the case, and the debtor finally came to the conclusion that the best thing to do in the interests of all concerned was to assign his assets to a trustee. The statement of affairs showed liabilities of £5,238, there being 135 trade creditors whose claims aggregated £2,881, and there were cash creditors for £2,357. The assets were estimated to realise £1,255, less £119 for preferential claims, leaving net assets of £1 136, or a deficiency of £4,102. Mr. Whyte added that probably £950 would be available as net assets, or 3s. 6d. to 3s. 8d. in the £ for the creditors. A number of creditors had assented to the deed. A creditor asked when Mr. Toogood retired from the business, and it was stated that there was a dissolution last March, when the debtor took over the assets of the business and agreed to discharge all the liabilities. Subsequently a further deed of dissolution was entered into. When Mr. Toogood left the partnership he commenced a similar business on his own account, which he had since disposed of. Mr. Toogood did not receive anything when he left the partnership.

The debtor was called into the room, and in answer to questions said that when the dissolution of partnership took place a notice of the fact was sent to the ELECTRICAL REVIEW and to the Business Names Registry. So far as he knew the creditors were not advised of the dissolution. When the business was commenced, money was advanced by certain gentlemen under an agreement which provided that they should receive 10 per cent. per annum interest and a varying share of the profits. The chairman said that if that statement was correct then his view was that the creditors who advanced money under the agreement could not rank in competition with the other creditors. The liabilities would have to be reduced accordingly. In answer to further questions, the debtor said that he recently borrowed £100, and as security gave a bill of sale on his furniture. That money was required as the Sheriff was in possession at London and Bournemouth. Asked what the drawings of the partners had been, the debtor said that they each received £10 a week, although latterly the amount had been reduced. It was decided that the matter should be dealt with under a deed of assignment to Mr. W. A. J. Osborne, of Messrs. Corfield & Cripwell, Balfour House, Finsbury Pavement, E.C., as trustee, failing which the estate should be dealt with in bankruptcy.

HUGH MCTAGGART, trading as H. McTaggart & Co., 4, Edward Terrace, Cardiff, wholesale distributor of electrical and radio goods.—A meeting of the creditors of the above was held recently at the offices of Messrs. Jones, Robathan & Co., Cardiff Docks, when a statement of affairs was submitted which disclosed liabilities of £3,527, of which £3,397 was due to the trade and £130 to the bank. The assets were estimated to produce £2,753; from this had to be deducted £19 for preferential claims, leaving net assets of £2,734, or a deficiency of £793 It was reported that the debtor commenced trading in February, 1924. He had previously been associated with a well-known company in the trade. He applied to be admitted as a member of the N.A.R.M. in order that he might obtain the wholesale terms, but it was not until the beginning of the current year that his application was granted. It appeared that purchases to the extent of something like £1,300 from members of the N.A.R.M. had to be disposed of at cost price, and no profit or special discount was obtained. When he was admitted to the N.A.R.M. one of the conditions was that he immediately purchased stock to the value of £500, of which about 50 per cent. was still unsold. During the first three months the debtor expended a substantial amount in advertising, and the sales had shown a steady increase. The debtor attributed his present position to the loss of the special discounts from the N.A.R.M. members, to general bad trade in South Wales, bad debts, and to over-estimating the amount of stock required to carry on the business. During the fourteen months to March last the debtor's turnover was between £9,000 and £10,000. It was decided to appoint a committee to consider a scheme for the payment of the debts in full.

Bankruptcy Order Annulled. — E. A. THORN, house decorator and electrical engineer, carrying on business at 22, Mossbury Road, Clapham Junction, S.W. Adjudication and receiving order of July, 1910, annulled June 18th, 1925; debts, costs, charges and expenses of the bankruptcy having been paid in full.

Deed of Arrangement.—HAROLD PETERS, 5, York Road, Colwyn Bay, trading as the Peters Electric Co.—The trustee under a deed of arrangement, Mr. P. W. Aston, Colwyn Bay, reports that the net realisations totalled £322. A dividend of 2s. 1d. in the pound has been paid on an amount of £1,598.

Dissolution of Partnership.—SAXTON & WELLS, mechanical and electrical engineers, Dawson Street, Hyde, Chester.—Mr. R. Saxton and Mr. W. C. Wells have dissolved partnership. Mr. Wells will attend to debts and continue the business under the same style.

Catalogues and Lists.—THE LONDON ELECTRICAL CO., LTD., 1, Sherborne Lane King William Street, E.C.4.—A net trade price list of electrical materials and accessories, and an illustrated catalogue of domestic appliances.

MESSRS. J. HOPKINSON & CO., LTD. Britannia Works, Huddersfield.—List No. 1,830, describing a number of the company's "all-metal" draught gauges.

AUTOVEYORS, LTD., 84, Victoria Street, S.W.1.—A series of illustrated and priced pamphlets, giving particulars of "Clix" connectors, loop aerials, condensers, and many other radio accessories.

THE STEAM FITTINGS CO., LTD., West Drayton, Middlesex.—Two illustrated pamphlets dealing respectively with the "Drayton" automatic temperature regulator and steam-pressure reducing valves.

THE ELECTRICAL EQUIPMENT & CARBON CO., LTD., Bank Buildings, 109-111, New Oxford Street W.C.1.—List No. R3, illustrating and describing "Telwave" condensers, jacks, switches and other radio components. Priced.

THE MARCONIPHONE CO., LTD., Marconi House, Strand, W.C.2.—A well-illustrated brochure dealing with the company's speech and music amplifying service for large public gatherings.

MESSRS. EVERSHED & VIGNOLES, LTD., Acton Lane Works, Chiswick, W.4.—List No. D158, illustrating and describing a traction recorder for electric railway working.

PERFECTION ELECTRIC HEATERS, Hillside Works, Bard Street, Sparkhill, Birmingham.—A folder containing illustrations and prices of the company's irons, kettles grills, &c.

MESSRS. H. E. ASHDOWN (BIRMINGHAM), LTD., Perry Barr, Birmingham.—A priced catalogue of cabinet radio receiving sets, condensers, loud speakers, &c.

Messrs. Belbin & Bowden, Ltd., 3, Finsbury Square, E.C.2.—A leaflet giving prices of "Bow Bells" incandescent electric lamps.

The Hart Accumulator Co., Ltd., Stratford E.15.—List No. 164, describing the Hart "Magno" accumulator for use with dull-emitter radio valves. Priced.

The New Italian Art Association, Ltd., 28, Newman Street, W.1.—A priced and illustrated catalogue of English and Italian alabaster bowls and fittings.

Messrs. A. J. Stevens & Co. (1914), Ltd., Walsall Street Branch, Wolverhampton.—A novel showcard, representing a number of the firm's radio receiving sets and a loud-speaker, in attractive colours.

Venner Time Switches, Ltd., 45, Horseferry Road, S.W.1.—Lists Nos. 22 to 26, dealing with shop-window and street-lighting time switches, oil-break time switches, an automatic electric buoy lamp, and other switching apparatus.

The Stirling Boiler Co., Ltd., 32 and 33, Farringdon Road, E.C.4.—A well-illustrated brochure containing descriptions of the company's "tri-drum" boilers and their employment.

British Insulated & Helsby Cables, Ltd., Prescot, Lancs.—Pamphlet P190, describing the company's corrosion-proof armoured cables.

Messrs. Pritchett & Gold & E.P.S. Co., Ltd., 50, Grosvenor Gardens, S.W.1.—A series of photographic views of "Dagenite" battery plates after severe tests in comparison with a foreign battery over a period of 18 months.

Book Notices. — "Illumination Engineering Nomenclature, and Photometric Standards."—The eighth edition of the complete nomenclature adopted by the American engineering societies in accordance with American Engineering Standards Committee procedure. This edition was approved as an American standard, April 29th, 1925.

The Brown Boveri "Review."—Vol. XII, No. 6. June, 1925. London: The British Brown Boveri Ltd.

"Annali dei Lavori Pubblici gia Giornale del Genio Civile." Vol. LXIII, No. 4. April, 1925. Rome: A. de Gaetani.

"Jahrbuch der Elektrotechnik," by Dr. K. Strecker. Munchen: R. Oldenbourg.

"Science Abstracts" A and B. Vol. XXVIII. Part 6. July 25th, 1925. London: E. & F. N. Spon, Ltd. Price 3s. each.

"*Journal* of the American Institute of Electrical Engineers." Vol. XLIV, No. 6. June, 1925. New York: The Institute. $1.

"Time Standardisation of Workshop Operations," by T. Pilkington. Pp. x+253; figs. 91. London: Sir Isaac Pitman and Sons, Ltd. Price 16s. net.

"Electrical Machinery Erection," by T. Croft. Pp. ix+314; 334 figs. London: McGraw Hill Publishing Co., Ltd. Price 15s.

"The Broadcasting Time Table and Reception Log," compiled by R. Grierson. Fourth edition. 32 pages. London: Chapman & Hall, Ltd. Price 2s. 6d. net.

"Memoirs of the College of Engineering," Kyoto Imperial University, Japan.—Vol. II, No. 7, "Theory of Distortionless Alternators," "Theory of Two- and Three-phase Generators" and "Theory of Single-phase Generators"; Vol. III, No. 5, "Formula for the Strength of Struts, &c."; Vol. III, No. 6, "On the Age-hardening of Aluminium-rich Al-Zn Alloys," &c.; Vol. III, No. 7. Published by the University.

"The Selected Papers from the *Journal* of the Institute of Electrical Engineers of Japan."—No. 1, The electromagnetic induction and the effective self-inductance of a rectilinear transmission line with earth return, and the potential difference of the earth surface; No. 2, On the continuity of vector power in an alternating electric and magnetic current field; No. 3, On the induction synchronous motor characterised by automatic transition; No. 4, Transient phenomena in a short-circuited alternator. Tokio: The Institute of Electrical Engineers of Japan.

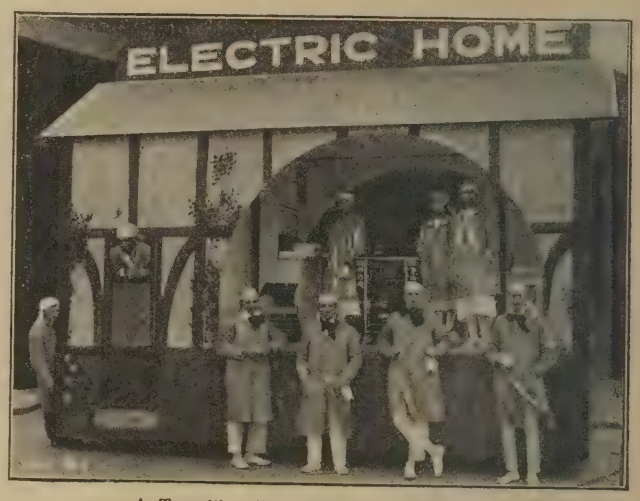
"Power Switchboard and Switching Equipment Handbook," 1st edition, May, 1925.—Issued by the Electric Power Club, B. F. Keith Building, Cleveland, Ohio, U.S.A. Price 50 cents. Contains the Club's instructions for the installation, operation and care of switchgear; definitions, abbreviations and symbols relating to switchgear; and the adopted standards, safety standards and practices of the club. "Instructions for Care and Operation of Transformers," 3rd edition, May, 1925. Issued by the Electric Power Club. Price, 25 cents.—Contains the club's instructions dealing with the handling, storage installation and operation of both power and distribution transformers.

Scientific Papers of the U.S.A. Bureau of Standards.—No. 502, "An Improved Type of Wavemeter Resonance Indicator." (5 cents.)

Quarterly *Bulletin* of the Institution of Engineers, Australia. Vol. II, No. 6. April, 1925. Sydney: The Institution.

Indian Railway Developments.—In the course of a report on trade conditions in India, *Reuter's Trade Service* states that the Madras and Southern Mahratta Railway has in hand the construction of a marshalling yard at Tondiarpet, increased lighting arrangements, renewal of rails, girders and engines, and the elimination of level crossings. The Nizam's Guaranteed State Railway has in hand a big scheme for overhauling the old workshops at Lalaguda and remodelling them for the requirements of the next ten to fifteen years. It is estimated that the provision of suitable cranes, and pneumatic and electrical equipment alone will amount to nearly Rs. 5 lacs. Mr. G. R. G. Huddleston is in charge of this remodelling scheme.

Social Events.—On June 20th, the staff and employés of Messrs. J. & W. B. Smith, Ltd., held their first annual outing, sports meeting, and social evening, the *venue* being "Ye Old Rye House." The sports programme proved very enjoyable and at its conclusion a "meat tea" was served, at which Mr. Sloper proposed the toast of "The Firm and Directors," Mr. A. H. Miller, managing director, responding. Mrs. A. H. Miller presented the sports prizes and a concert and dance were then held concurrently.



Some 130 members of the Blackpool Tramways Employés' Institute held their annual trip on June 25th, when Ambleside was visited.

The annual summer outing of the staff and employés of the Ayrshire Electricity Board took place recently, the party numbering 160.

Over fifty members of the staff of the Engineering Department of the Blackpool Corporation tramways journeyed by motor coach to York for their annual outing last week.

Mexican Railway Electrification.—At the recent annual meeting of the Mexican Railway Co., Ltd., the chairman (Mr. V. W. Yorke), said that the work of electrification had been considerably delayed by the revolution, and it had not been possible to commence the services until October last. Since that time their experience had proved that the system was absolutely efficient and would result in reduced expenditure.

A Travelling Electric Home.—An effective tableau was arranged by the Grimsby Corporation Electricity Works (engineer, Lt.-Col. W. H. Vignoles), in connection with a recent fancy dress parade in aid of the Grimsby Hospital. This took the form of an "electric home" mounted on an electric

A Travelling Electric Home at Grimsby.

vehicle. As will be seen from the accompanying illustration, prominence was given to electric cooking. The attendants were dressed in powder-blue and white costumes and the display was justly awarded a prize.

Peace in Industry.—An extraordinary general meeting of the Industrial League and Council was held on June 24th under the presidency of Sir Ernest J. P. Benn, Bart., and the amalgamation of that body with the National Alliance of Employers and Employed was unanimously agreed upon. The agreement of the National Alliance had already been registered at its annual general meeting in May. With the exception of the necessary formal ratification and the settlement of minor details, the fusion is now complete. The programme of the new organisation will be a complete combination under a single control of all branches of activity hitherto pursued by both the old societies. New and far-reaching developments are in contemplation. The control will be vested in joint committees on which representatives of employers and trade unionists will be in equal numbers. As hitherto, associate membership is open to all individuals who accept the principles and constitution.

A French Company's Activities. — The Compagnie Electro-Mécanique reports that the results for 1924 (no dividend) were due to the unfavourable situation of the market. In the steam turbine branch the machines for 35,000- and 60,000-kW sets ordered last year were in course of erection, and the company also booked orders for turbines and turbo-generator sets of all powers up to 16,000 kW. The 150,000-V installations for the Southern Railway Co. and those at 120,000-V for the Société Hydro-Electrique de Lyon and the Forces Motrices du Rhône were put into operation. Orders have been booked for two new alternators of 10,000 kW at 16,000 V, while the production of small alternators is being developed to meet the large demand for rural electrification.

Copper, Lead, and Rubber Prices.—Messrs. F. Smith and Co. report, June 30th:—Copper (electrolytic) bars £64, 2s. 6d. increase; ditto ditto sheets, no change; ditto ditto wire rods, £74, 2s. 6d. increase; ditto ditto h.c. wire, 9¼d., 1/16d. decrease. Messrs. James & Shakespeare report, June 30th:—No change in the prices for copper bars (best selected), sheet and rod, and English pig lead.

Messrs. E. Till & Co. report, June 30th:—India rubber, Para, fine, 2s. 9½d., 2½d. increase.

New Belgian Company.—A new company has lately been formed in Liége with a capital of 1,500,000 fr., and the title La Société de Halage Electrique to establish a system of electric haulage on the Liége-Maestricht canal.

British Trade Mark Applications. — The following are among the recent applications for British trade marks. Objections against any of the proposed marks may be entered within one month from the dates mentioned below. In the case of foreign applications, the names and addresses of the British representatives are also given :—June 10th.—

Brandes (lettering and design). No. 455,642. Class 8. Radio receiving apparatus and parts thereof.—Brandes, Ltd., 296, Regent Street, W.1.

C.S.-Eones (lettering and design). No. 457,080. Class 8. Apparatus for use in radio-telegraphy and telephony.—C. F. Smith and R. Craik, trading in co-partnership, 41, Allen Street, Goswell Road, E.C.1.

Russell's genuine hertzite crystal (lettering and design). No. 457,997. Class 8. Hertzite detector crystals for use in radio-telephony.—L. G. Russell, 1-7, Hill Street, Birmingham.

Tropaformer. No. 458,379. All goods in Class 8.—R. A. Rothermel, Ltd., 24-26, Maddox Street, W.1.

Wunderway. No. 458.574. Class 8. Instruments and apparatus and parts thereof for use in radio-telephony and telegraphy.—Steels & Busks, Ltd., Ariel Works, Temple Road, North Evington, Leicester.

Ethodyne. No. 458,601. Class 8. Receivers for use in radio-telephony and telegraphy.—Burndept Wireless, Ltd.

X-Ray. No. 453,833. Class 13. Shades and reflectors of ordinary metal for use in connection with electric lighting.—British Thomson-Houston Co., Ltd.

June 17th.

Hermitic. No. 454,469. Class 8. Electric condensers.—Thomas Hougn, 62, Glengall Road, S.E.15.

Bico (lettering and design). No. 457,486. Class 8. Instruments and apparatus and parts thereof for use in radio-telephony and telegraphy.—The Briscoe Importing Co., Ltd., 9, Aston's Quay, Dublin.

Romar. No. 458,174. All goods in Class 8.—Joseph Perkins & Sons, Ltd., Albion Works, Astwood Bank, Redditch.

Superdyne. No. 458,602. Class 8. Receivers for use in radio-telephony and telegraphy.—Burndept Wireless, Ltd.

Seva (lettering and design). No. 458,111. Class 13. Electric soldering irons.—E. O. Johansson, 6, Rorstrandgatan, Stockholm (C. W. Cedervall, Swedish Chamber of Commerce, 14, Trinity Square, E.C.3).

June 24th.

Electrad (lettering and design). No. 456,036. Class 8. Apparatus for radio-telegraphy and telephony.—Electrad, Inc., 428-430, Broadway, New York (White, Langner, Stevens & Parry, Jessell Chambers, 88-90, Chancery Lane, W.C.2).

Palaphone. No. 456,177. Class 8. Apparatus for use in radio-telegraphy and telephony.—T. Morch, 67, Mount Pleasant Lane, Upper Clapton, E.5.

Izon. No. 456,529. Class 8. Apparatus for use in radio-telegraphy and telephony.—W. Watson & Sons, Ltd., 313, High Holborn, W.C.1.

Red Diamond (lettering and design). No. 457,318. Class 8. Apparatus for use in radio-telegraphy and telephony.—Jewel Pen Co., Ltd., 76, Newgate Street, E.C.1.

Red Seal (lettering and design). No. 457,909. Class 8. Instruments and apparatus for use in radio-telephony.—D. B. Tippetts, The Spinney, Grange Road, Dorridge, Warwickshire.

C. G. H. Mellowtone (lettering and design). No. 458,366. Class 8. Philosophical and scientific instruments and apparatus for useful purposes.—Midland Radiotelephone Manufacturers, Ltd., Brettel Lane Works, Stourbridge.

Superbalite. No. 458,293. Class 50. Electrical insulating material.—Società Moriti & Martini, 51a, Via Bergamo, Milan, Italy (Mewburn, Ellis & Co., 70-72, Chancery Lane, W.C.2).

A British Company and Mexican Taxation.—The *Financial News* states that it is reported from Orizaba that the Mexican Light, Power and Traction Co. under the tax revision must pay 25,000 pesos bi-monthly, increasing the total taxes to 375,000 pesos yearly, whereas the income of the company is given as 250,000 pesos. It is also reported that the company will be placed under an embargo for non-payment of taxes, but the report is not credited by the British Consul, Mr. King.

Business Opportunities in Czecho-Slovakia.—In a recent report the British Commercial Secretary at Prague states that there are openings for many classes of British goods in Czecho-Slovakia. One of the classes specially mentioned is electrical machinery, although in this direction, it is stated, Switzerland and Germany are serious rivals.

For Sale.—Taunton Corporation Electricity Department, owing to change of system, invites offers for surplus generating plant, including two 150-kW generating sets, alternators, transformers, &c. The Section Engineer, N. Section, Met. Power District, Mount Pleasant, invites offers for surplus generating plant. (See our advertisement pages to-day.)

German Cable Orders.—It was stated at the recent annual meeting of the Felten and Guilleaume Co. that the company had just received an order for a multiple-conductor lead telephone cable for laying between Holland and England. Negotiations were on the point of being concluded with the German Atlantic Telegraph Co. for the delivery by the Nordenheim works of a submarine cable to be laid between Emden and the Azores.

United States Electrical Exports. — The preliminary statistics of exports of electrical goods from the United States during April show that their total value was $7,817,184, an increase of almost $400,000 upon the April, 1924, figures, and of $100,000 upon the preceding month's total. Comparing April, 1925, with the same month of the previous year, it is seen that there was a large decline in the shipments of generators, steam turbo-generator sets, and parts; power and distribution transformers; large motors; switch and fuse-gear; and electric locomotives. Smaller decreases occurred in the cases of fans, telephone apparatus, ignition apparatus, and carbon products. The principal increases were in respect of self-contained generating sets (62 per cent.) batteries, converters, switchboards, meters (81 per cent.), motor starting and controlling equipment, lamps, flashlamps and searchlights, and domestic appliances. Radio apparatus experienced a phenomenal rise—from less than $300,000 in April, 1924, to over $850,000 in April last. Smaller increases occurred in the export of wiring supplies, porcelain, and insulated copper wire.

The Burden on Industry.—In the course of his speech at the annual meeting of Ruston & Hornsby, Ltd., on June 22nd, Mr. J. S. Ruston referred to the heavy burdens which industry had to bear whether it was making a profit or not. He said that unemployment and health insurance cost the company £25,000 a year and the new proposals would add a further £6,000. On the top of that the poor and district rates amounted to £31,000 per annum, making a total of £60,000 a year. In dealing with the company's productions, Mr. Ruston said that it had supplied a further number of the largest excavating machines ever constructed, both steam and electrically operated. The boiler works was fully occupied. A large number of electric power stations had adopted the company's vertical oil engines of sizes up to 1,100 h.p. In spite of any cheapening of electrical power they hoped still to obtain orders in direct competition.

Low-Temperature Distillation Plant.—International Combustion, Ltd., informs us that its American associated company has obtained a contract for installing a large low-temperature distillation plant for the Milwaukee Electric Light & Power Co.

Unemployment.—There was a fall of 10,490 in the number of registered unemployed in the week ended June 15th, the total at that date being 1,280,700.

Chinese Notes.—The *Chinese Economic Bulletin* states that a number of capitalists are organising an electric lighting company at Tsangchow, Chihli province. A temporary office has been opened at Ta Mo Chang, Peking.

The Chinese Commercial Association, Shanghai, promoted by the president of the Shanghai Chamber of Commerce and directors of other Chambers of Commerce with a view to developing China's commerce, has completed its organisation.

Both the Shanghai Electric Construction Co., Ltd., which operates trams in the International Settlement and the company which runs trams in the French concession, raised their fares in April last on account of the depreciation of the copper coinage.

The Shansi authorities have recently drawn up a plan for the establishment of generating plants in Taiyuan and 14 other districts. The Taiyuan plant is to have an initial capacity of 1,500 kVA in one unit and will cost $560,000 (including the provision of $100,000 working capital). The other stations will each have an initial installation of one 500-kVA generator and the necessary auxiliaries and will cost $210,000 ($50,000 working capital). Thus the total initial outlay will be $2 940,000.

A company composed of local business men has inaugurated a generating plant at Ichowfu, Shantung province.

A small hydro-electric plant has been started up at Luchow and another site 55 li from Chengtu has been studied for the erection of a similar station.

The Wuchang Electric Light Co. is issuing capital stock to the extent of $1,150,000. The proceeds will be devoted to the purchase of new machinery and equipment.

The Shanghai Mutual Telephone Co., Ltd., which operates in the International Settlement and the French Concession, has raised its capital to Tls. 2,500,000, new shares to the value of Tls. 500,000 having been allotted to the existing shareholders.

The South Manchurian Railway Co. has instituted a tram service between Shahochen, China, and Hsin Wiju, Korea.

A number of additional telephone services are being established in the Kongmoon district.

It has been decided to install a long-distance telephone service between Ningpo and Hangchow. The wires are to be strung on existing telegraph poles.

The Chinese Electric Power Co., Ltd., which operates tramways in the part of Shanghai under Chinese administration, has decided to erect two car depôts. Tenders for the steelwork, &c., have been invited.

The Tientsin radio station, owned by the Tientsin Telephone Administration, was put into operation in April. The station works on a wavelength of 1,000 metres, and a charge of 0.5 fr. per word is made for all messages.

Calendar.—BROOKHIRST SWITCHGEAR, LTD., has sent us calendar cards for July, August, and September, each of which bears an interesting pencil drawing of old Chester.

New Municipal Showrooms.—The Chester Corporation's new electrical showrooms were officially opened by the Mayor on July 1st.

Boiler Contracts.—The Vickers-Spearing Boiler Co., Ltd., has recently received contracts from the Bloemfontein Municipal Electricity Department, the Calcutta Electric Supply Corporation, Ltd., and the Bristol Municipal Electricity Department. The last contract is for the complete equipment of the boiler-house extensions, including buildings, two boilers, mechanical stokers, economisers, pipe work, &c.

Italo-American Agreement.—The *Electrical World* reports that the General Electric Co. (America) has concluded an agreement with the Società Italiana Pirelli, of Milan, for working in the United States the Italian company's patents relating to paper-insulated cables, joints and fittings, together with the use of manufacturing and research information with regard to this type of cable.

Uruguayan Tariff Reduction.—Electrically-driven pumps which have been subject to a duty of 31 per cent. of the official valuation, plus surtaxes when imported into Uruguay, are now classed as "industrial machinery" and are accordingly subject only to a duty of 5 per cent., plus surtaxes.

Electricity Supply Commercial Association.—From Saturday, July 4th, the address of the Association will be "Beaulieu," Bean Road, Bexley Heath.

Lighting and Power Notes.

Aylesbury.—Electricity Supply.—The Town Council has received a Special Order for extending its area of supply in certain parts of the counties of Buckinghamshire, Hertfordshire, and Oxfordshire. A loan of £3,000 has been applied for to meet the costs of a converter and switchgear at the works of Hazell, Watson & Viney.

Barking Town.—Electricity Supply.—At a recent meeting of the Electricity Committee it was reported that the Electricity Commissioners were in favour of a bulk supply being obtained from the cheapest source, and it was decided to obtain quotations from the County of London Electric Supply Co., Ltd., and the West Ham Corporation. The Committee also decided in favour of the principle of using the land at the rear of the existing station for electricity purposes, and asked the engineer to prepare specifications and invite tenders for the necessary transformer plant and prepare plans for the buildings required.

The annual report of the electricity undertaking for the year ended March 31st last shows that the net profit was £2,660, as compared with £5,758 for the previous year, the reduction being due to reduced electricity charges.

Bedford.—Electric Cookers.—The Electricity Committee has recommended to the Town Council that 50 electric cookers be purchased at a cost of £700, to be let out on hire.

Bingley.—New Sub-Station.—The new sub-station which is now almost completed will be formally inaugurated by Mr. T. Snowden, chairman of the Lighting and Tramways Committee, on July 2nd. The station has been erected in connection with the supply for Keighley Corporation and will be capable of carrying three times the load of the old station.

Croydon.—Loans Sanctioned.—The Electricity Committee has received sanction to borrow £1,060 for laying a h.p. feeder main, and £2,000 for the installation of electrical plant at Beddington sewage farm.

Dover.—Year's Working.—The accounts of the Corporation electricity undertaking (engineer, Mr. H. D. Munro), for the year ended March 31st last record a total revenue of £52,817, as compared with £49,914 in 1923-24. Working expenses amounted to £28,415, as against £19,542, leaving a gross profit of £24,402 (£30,372). After deducting capital charges there was a net surplus of £4,023; this has been dealt with as follows:—Extinction of debit balance from previous year, £674; set aside for depreciation of investments, £2,000; carried forward, £1,349. The capital expenditure during the year amounted to £15,239, and the total expended on the undertaking now stands at £282,321. The electrical energy sold increased from 2,339,394 to 3,233,777 kWh, and the average price per kWh obtained fell from 4.83d. to 3.92d.

Eastbourne.—Year's Working.—We have received from Mr. J. K. Brydges, borough electrical engineer, a copy of his report and statement of accounts on the working of the electricity undertaking for the year ended March 31st last. The total revenue amounted to £80,274, and working expenses were £49,554, leaving a gross profit of £30,719. The figures in the preceding year were—revenue, £79,033; working costs £52,639; gross profit, £26,394. After deducting capital charges there was a net surplus of £6,744, as compared with £1,695 in 1923-24. A contribution of £4,000 was made to the borough fund. The capital expenditure, which included £23,483 for mains and services, amounted to £38,120. The sales of electrical energy increased from 4,921,769 to 5,614,602 kWh and the average price per kWh obtained fell from 3.56d. to 3.29d. The maximum supply demanded rose from 3,251 to 3,638 kW. During the year a new 2,500-kW turbo-alternator and boiler were formally inaugurated.

Gateshead.—"All-Electric" Houses.—The Corporation has decided to equip a further 138 houses on "all-electric" lines.

Glasgow.—Electrical Development.—The Corporation Electricity Committee has reported that during May 151 houses were wired, bringing the total to date to 982 and that 157 applications for the hire of domestic appliances were dealt with, bringing the total to 7,128.

Gloucester.—Extension of Supply.—At a special meeting on June 24th, the City Council decided to make an application for a Special Order for the extension of its area of electricity supply, adding thereto the rural district of Gloucester. The electrical engineer (Mr. F. H. Carson) explained that the proposal was to lay underground mains generally in the city and in its immediate vicinity, and to supply the outlying districts by means of overhead lines. The cost of the underground lines would be about £15,000, overhead lines about £8,100, and l.p. mains about £20,000, and the total would be approximately £51,600.

India.—Development in Central Provinces.—The Nagpur Electric Light and Power Supply Co. has completed the work of extending mains into the city. The B.N. Railway and the G.I.P. Railway Companies have also entered into an agreement for a bulk supply, the latter railway guaranteeing to take a supply of 60,000 kWh per annum. A licence for the supply of electrical energy to the town of Wardha has already been granted and materials for the overhead lines have been ordered and the construction of the power house commenced. Licences for the towns of Hinganghat and Amraoti have been issued and the schemes are making progress. Jubbulpur will also soon have a public supply of electricity; the licence has recently been issued and orders have not yet been placed for materials. There are three coal mines using electrical power at present in the Central Provinces, *viz.*, Mohpani, Ballarpur and Rajura.

Irish Free State.—Granard (Co. Longford).—The Urban District Council has sanctioned the installation of plant in the town for generating electricity.

Lexden and Winstree.—Electricity Supply.—The Rural District Council has appointed a Committee to consider the question of a proposed extension of the electricity supply from Colchester into its area.

London.—Hammersmith.—The Electricity Committee has recommended to the Borough Council that an agreement be entered into with the Barnes Urban District Council to furnish a bulk supply of electricity in the Barnes area, upon terms and conditions to be approved by the Committee.

St. Marylebone.—The Electricity Committee proposes to provide transformer stations at Morley House and Marcol House, Regent Street, and the Langham Hotel, Portland Place, at an estimated cost of £13,535, and has recommended that application be made for sanction to the borrowing of this sum for the purpose.

The Education Committee has obtained sanction to loans of £2,869 for switchgear, &c., in connection with the supply of electricity to the L. & N.E.R. premises in the borough, and of £13,112 for cables and switchgear in connection with the bulk supply of electricity from the Central Electric Supply Co., Ltd.

Hackney.—The conversion of 208 street lamps from gas to electricity in the Clapton Park district having been successfully carried out, the Finance Committee has recommended that the scheme proposed by the Electricity Committee for the conversion of the remainder of the street lamps in the borough from gas to electricity be proceeded with.

Fulham.—In view of the additional plant recently installed at the electricity works, the undertaking has been raised from class D to class F, with corresponding increases in the salaries of the technical staff.

The Electricity and Lighting Committee has recommended that the Granville sub-station be refitted with new apparatus at a cost of £1,280.

Electricity Supply Bills.—The Special Committee on London Electricity Supply has reported to the L.C.C. that consideration has been given to the question of procedure to be followed in the event of the passing into law of the London Electricity Supply Bills, and the approval of the London and Home Counties Electricity District Order, as regards the fixing of the standard prices for the various companies by the Council, and states that in this connection it will be necessary to ascertain the value of the existing assets of the companies. Owing to the urgency of the matter, the Committee states that it is desirable that preliminary work should be put in hand without delay, and has recommended that the services of Mr. W. Cash, F.C.A., who assisted in drawing up the sliding scale, and Mr. J. H. Rider, who was engaged in connection with the drawing up of the technical scheme, be secured. The Committee has also recommended that a supplemental maintenance estimate of £1,500 be approved to cover expenditure.

Northern Ireland.—Lucan.—Since the closing down in January last of the Dublin and Lucan Electric Railway, electrical energy has been supplied, as before, to about 80 private houses, churches, hotels and institutions along the line of route. The service, however, has been carried on at a loss and it is now to be terminated.

Armagh.—Mr. J. McClinaghan, Lisbien, having withdrawn his offer to light the city by electricity, a proposal has been made that the City Council should promote a scheme of its own.

Palestine.—Rutenberg Scheme.—According to *The Times*, the Haifa electric power station—the second stage of the Rutenberg scheme—was opened on June 24th by Sir Herbert Samuel, the retiring High Commissioner for Palestine. The station is larger than the similar one at Jaffa, and the engines have all been bought from British firms. The attitude of the local Arabs is doubtful, but the Arab quarter of the town is being lighted for 15 days "on approval."

Plymouth.—Proposed Water-power Scheme.—The Didworthy Sanatorium Committee has requested the Water Committee to instruct the water engineer to gauge the flow of the River Avon by the sanatorium lands and, if satisfactory, to obtain a report from a firm of engineers as to the possibility and cost of installing a plant for generating electricity by water power.

Price Reductions.—Reductions in the charges for electricity have been made or recommended in the following districts:—

Huddersfield.—Three-phase supply: From 25 per cent., to 12½ per cent., above the pre-war charge; minimum net price per kWh on scale reduced from .65d. to .6d.; tramway supply, .1d. per kWh; lighting, from 4½d. to 4d. per kWh.

Accrington.—Heating and domestic purposes: From 1¼d. to 1d. per kWh. Rateable value system: The "unit" charge from 1¼d. to 1d. The discount of 5 per cent., for prompt payment of accounts is increased to 10 per cent.

YORK.—Lighting: From 5½d. to 4¾d. per kWh. Power: A reduction of approximately 10 per cent.

SWINTON AND PENDLEBURY.—Electricity for all purposes to be reduced from 50 to 33⅓ per cent. above the pre-war rate.

WEST HAM.—Lighting: 4½d. per kWh; in factories to the extent of 10 per cent. for quarterly accounts and 15 per cent. for monthly accounts, of consumption for power, 3½d. per kWh. Power: First 40 kWh per h.p. installed per quarter, 3¾d. per kWh; all energy in excess 1½d. per kWh. Heating and cooking: 1½d. per kWh. Arc lamps: 4½d. per kWh. All accounts subject to a discount of 5 per cent., for prompt payment.

Rawtenstall.—ELECTRICITY CHARGES.—At a recent conference between the Rawtenstall and Bacup Corporations, the following scale of charges to the Bacup Corporation were adopted as from July 1st next to June 30th 1926:—First 10,000 kWh per month, .9d. per kWh; next 10,000 kWh, .85d.; next 30 000 kWh, .8d.; next 50,000 kWh, .75d.; all additional energy, .7d. The following scale of charges to consumers in both boroughs has been adopted as from July 1st next:—Lighting: First 100 kWh per quarter, 6d. per kWh; all energy in excess, 5½d. per kWh. Power: Small consumers, varying from 2½d. to 1d. per kWh, according to quantity consumed; large consumers, varying from .9d. to .75d. per kWh, according to amount consumed.

ELECTRICITY EXTENSIONS.—In view of the increasing demand for electricity, the Corporation Electricity Committee is considering the advisability of extending the electricity works at Hareholme, and has instructed the electrical engineer to prepare a scheme, with an estimate of the expenditure involved.

Salford.—INAUGURATION OF NEW POWER STATION.—The Corporation's new power station at Agecroft is nearing completion and will be formally inaugurated by the Mayor on September 23rd. Provision has been made for the accommodation of plant with a capacity of 50,000 kW, comprising four sets of 12,500 kW each, and the water-circulating system and coal-handling plant will be capable of dealing with a capacity of twice this amount. The station has been designed by Mr. J. A. Robertson, consulting engineer, of Manchester, and has been constructed under his supervision. The cost of the station, when completed, will be £710,000.

Skipton.—YEAR'S WORKING.—At the June meeting of the Urban District Council it was reported that the first year's working of the electricity undertaking, which ended on March 31st last, resulted in a loss of £627. It was stated that overhead charges had increased the initial charge of 1d. per kWh to 7d., and that the average loss per kWh was 1d. The extension of the use of electricity for street lighting was urged. With regard to recent breakdowns, it was reported that they were all on the Keighley portion of the supply line and the Yorkshire Electric Power Co., in response to the Council's complaint stated that the breakdowns were due to faults on the Keighley Corporation mains.

Southend-on-Sea.—LOAN.—The Town Council is applying for sanction to a loan of £20,000 for feeder and distributing mains.

South-East Lancashire Electricity Board.—The Board has had under consideration data supplied by the Councils of Billinge, Orrell and Upholland, and the results of investigations by the Lancashire Electric Power Co. and the Wigan Corporation, and has come to the conclusion that the demand for electricity in the areas in question is not such as to indicate a reasonable prospect of the supply being remunerative. The Board has expressed its willingness to support the development by the Wigan Corporation of the portions of Orrell in the neighbourhood of the Wigan boundary, under the Fringe Order procedure.

Special Orders.—The Minister of Transport has confirmed an Order made by the Electricity Commissioners for the supply of electricity by Leeds Corporation in the township of Alwoodley and part of the township of Adel-cum-Eccup. The Commissioners have submitted to the Ministry for confirmation an Order for the supply of electricity by the Somerset Electric Supply Co., Ltd., in the city of Wells, the borough of Glastonbury, and a number of urban and rural districts in the County of Somerset.

Stoke-on-Trent.—"ALL-ELECTRIC" HOUSES.—The Corporation Housing Committee has voted a subsidy of £100 per house in respect of four "all-electric" houses to be erected by the Electricity Committee.

Wortley.—ELECTRICITY FOR HOUSING SITE.—The local Council has requested Sheffield Corporation to extend its cables to the Council's new housing site at Mortomley.

Tramway and Railway Notes.

Barking Town.—YEAR'S WORKING.—The Urban District Council reports a loss of £8,232 on the tramways for the year, compared with a loss of £6,139 in the previous year.

Birmingham.—NEW CARS.—At a recent meeting of the City Council, a recommendation of the Tramways Committee to borrow £66 000 for the purchase of 30 new tram-cars was approved. It was stated that the contract for the supply of the electrical equipment of these new cars had been secured by a Birmingham firm, but that the Corporation had neither the accommodation nor the plant to build the bodies.

Bury.—THROUGH-RUNNING.—According to the *Electric Railway and Tramway Journal*, the provision of a through service of tramcars between the town and Manchester has been considered by the Tramways Committee, which has instructed the town clerk and tramway manager to enter into preliminary negotiations with the Salford Corporation Tramway Department with regard to the introduction of a service between Bury and Deansgate. If the negotiations are successful, and a scheme is adopted, the necessity for changing cars at Whitefield will be removed. The through service of tramcars between Bury and Rochdale will be resumed on Monday, July 13th. This will restore the pre-war service.

Continental.—BELGIUM.—The Commercial Secretary of the Department of Overseas Trade at Brussels reports that the Société des Tramways Electriques du Pays de Charleroi is about to make the following extensions to its tramway system:—The Montigny-sur-Sambre-Charleroi line to be extended to La Neuville; the Charleroi-Couillet line to be extended to Chatelet; the Charleroi-Gilly line to be extended to Vieux-Campinaire.

Croydon.—MOTOR-'BUSES.—The Town Council has decided to accept the offer of the L.G.O. Co. to enter into negotiations for a service of motor-'buses in Addiscombe Road before coming to a decision upon the question of relaying the present tramway track or running railless cars in the Addiscombe district.

Iraq.—BAGHDAD.—Mr. Stanley, representing the Baghdad Tramways & Electric Lighting Syndicate, Ltd., is negotiating with the Government for the modification of the electric tramway concession for Baghdad, which was granted before the war to Mahmood Shabandar, and subsequently bought for about £40 000. It is thought that an agreement is improbable, and that Mr. Stanley will resort to arbitration in accordance with the provisions of the Lausanne Treaty respecting pre-war concessions.

Light Railways.—EXTENSION OF TIME.—The Minister of Transport has sanctioned the extension of time for the completion of light railways under the West Manchester Light Railways Order, 1906, and the Stretford Light Railways Order, 1906, to June 15th, 1926.

Northern Ireland.—BELFAST.—The annual report and statement of accounts of the Corporation tramway undertaking (general manager, Mr. S. Carlisle), for the year ended March 31st last, shows a total income of £603,818, as compared with £594,855 in 1923-24. Working expenses amounted to £390,383 as against £404,856, and expenditure on Bellevue recreation ground charged to revenue account amounted to £5,752, making a total of £396,135. The gross profit was therefore £207,683, and after deducting capital charges there was a balance of £126,962, which was carried forward to appropriation account. This was dealt with as follows:—Redemption contributions, £46,891; annual payment to depreciation or renewals fund, £25,000; surplus carried forward £55,071. The surplus brought forward from the previous year was £31,651. The capital expenditure during the year was £215,343 the chief item being £167,335 on permanent way reconstruction. The number of car miles run increased from 6,857,046 to 7,451,549, and the passengers carried from 94,237,313 to 101,476,902. The revenue per car mile fell from 20.82d. to 19.45d. During the year the system was extended from Woodvale Road to Glencairn Road and the overhead work in connection with the Dundonald and Chichester street extensions was completed. Reconstruction of permanent way was carried out on several routes, the total being about 10½ miles.

Sheffield.—YEAR'S WORKING.—The report and statement of accounts of the Corporation tramway undertaking (general manager, Mr. A. R. Fearnley), for the year ended March 31st, shows a total income of £878,383, as compared with £845,447 in 1923-24. Working expenses amounted to £633 887, as against £617,845, leaving a gross surplus of £244,496 (£227,602). Capital charges absorbed £125,068, and there was a net profit of £119,427, as compared with £106,229 in the preceding year. The sum of £89,902 was expended on permanent way repairs and renewals during the year. Extensions and doubling of track were carried out in various parts of the city, and 25 double-deck tramcars of improved design were put into service. The rolling stock now consists of 392 tramcars, 64 motor-omnibuses, and 27 miscellaneous vehicles.

Thornaby.—TRAMWAY IMPROVEMENTS.—With a view to relieving local unemployment next winter, the Council has under consideration a scheme for doubling the tramway track in Middlesbrough Road.

United States.—PETROL-ELECTRIC 'BUSES.—Albany, N.Y., is the third citiy in America to adopt petrol-electric 'buses, Philadelphia and Atlanta having already begun to use this kind of equipment. The Albany vehicles were selected after the trial use of one 'bus since March 1st, so that both winter and summer transportation problems have been encountered. Trolley and petrol 'buses have been previously used by the operating company the Capitol District Transportation Co., a subsidiary of the United Traction Co. The new type of drive, introduced last autumn, consists of a petrol engine, connected direct to an electric generator that, in turn, drives two electric motors which, through worm gears, in special Timken housing, with full floating axles, transmit the power to the road wheels. The nineteen Fageol 'buses will be equipped with Hall-Scott six-cylinder engines and American General Electric generators and motors. The advantages claimed for the petrol-electric drive include greater comfort for passengers, more rapid acceleration without jerking, higher schedule speeds, elimination of skidding, and reduction of maintenance costs.

Telegraph and Telephone Notes.

Italy.—Telephone Concession.—The company which is to handle the telephone concession in the South of Italy that has been obtained by, among others, the Swedish L. M. Ericsson Co., is to have a capital of 50,000,000 lire, of which 27,500,000 lire, or 55 per cent. is said to have been paid, while the remainder will be called for as required. The majority of the capital, in accordance with the terms of the concession, will be held by Italians. The activity of the company was to begin on July 1st, when the network was to have been taken over from the State.

Radio at Sea.—New Ships' Outfits.—The s.s. *Chitral*, of the P. & O. Steam Navigation Co., has been equipped by the Radio Communication Co., Ltd., with a main installation comprising a 1½-kW spark transmitter with a daylight range of 800 miles and a c/w transmitter with a daylight range of 1,500 miles, while an emergency spark set, worked from a battery of accumulators, is provided for use in case of possible breakdown. A direction finder is also fitted and the new Board of Trade regulations in respect of radio equipment for lifeboats have been complied with by the provision of a ¼-kW set.

The Cork Harbour Commissioners have ordered from the Marconi International Marine Communication Co. Ltd., an installation for their pilot boat. The equipment will consist of a standard quenched-spark transmitter and a five-valve directional receiver which can be used with the boat's main aerial for "all-round" reception, or by means of a switch a frame aerial is brought into use in conjunction with the main aerial, and the receiver can be used for direction-finding. The transmitter has a minimum range of 80 miles.

Mission Ship's Outfit.—The s.s. *Strathcona II*, belonging to the Royal National Mission to Deep Sea Fishermen, has been equipped with Marconi apparatus; she is the only ship belonging to the Mission to be fitted with a transmitter, though other ships carry receivers. The vessel will undertake the duties of tender to the hospital stations on the shores of Newfoundland and Labrador. The transmitter is the standard Marconi ½-kW quenched-spark installation, and the receiver has been specially constructed to receive on all wavelengths up to 26,000 metres, thus covering all transmissions of meteorological bulletins, time signals, &c., which will be of especial value to the fishing fleets. Only one valve is employed in the receiver, and inductive coupling is used, which makes the tuning very selective.

The Telephone Service.—Public Kiosks.—The new type of telephone kiosk designed by Sir Giles Gilbert Scott will shortly be put up in the large towns by the Post Office. They will be a yard square inside, with large windows of 18 panes on three sides, and have improved ventilation. The number of road kiosks in England increased from 931 at the beginning of the year to 1,129 at the end of April, and the rate of progress is being maintained. London's kiosks have increased from 52 to more than 120 this year, and 45 more are being built. Negotiations are in progress with 160 provincial towns for the building of street telephone boxes, says the *Daily Mail*. More kiosks are to be erected in the residential suburbs of Greater London, where, on early closing days, considerable difficulty is often experienced in obtaining access to a telephone call box. The advantage of the kiosk is that it is open day and night throughout the week, including Sunday.

Anglo-Dutch Service.—The Postmaster-General announces that the facilities for telephonic communication between Great Britain and Holland have recently been considerably increased. Additional circuits are now working, and communication between this country and Amsterdam, Rotterdam, The Hague, and the principal towns in Holland can be obtained (with the exception of the period between eleven and twelve noon) practically without delay.

Radio Notes.

Aerials. — Height Restriction. — The Coulsdon Town Council recommends that radio receiving aerial poles on housing estates should not be allowed to exceed 25 ft. in height.

Germany.—Rhineland Prohibition Relaxed.—The Rhineland Commission is considering the possibility of rescinding to some extent the prohibition of broadcasting in the occupied area. The use of wireless apparatus is to be permitted for certain business and educational purposes, says *The Times*, and the final decision regarding permits is to be left to the responsible Army Generals of the respective districts.

Labrador.—Radio Outfit.—The Moravian Mission boat *Harmony*, which recently left the London Docks on her annual visit to Labrador, is taking out a four-valve wireless set which has been specially made for use in the Mission boarding school for Eskimos and the children of settlers at Makkovik. The set is a present from listeners who heard Captain Jackson speak about the mission work in Labrador from 2LO. He hopes that the Makkovik school will be able to get American stations like Schenectady regularly, and be kept in touch with "home" through the news bulletins from Chelmsford.

Meteorological Forecasts.—Ships' Service.—On and after July 1st the British Broadcasting Co. will co-operate with the Mercantile Marine Department of the Board of Trade, the Meteorological Department of the Air Ministry, and the Post Office in extending to smaller coastal vessels gale, fog, and other shipping warnings. Since the beginning of last year broadcast warnings to shipping have been sent out by the Air Ministry on a continuous w-t wave (4,100 metres) twice a day, and from June 1st of this year, for the benefit of vessels not fitted to receive the long wave, warnings have been sent on the 600-metre spark from the Cullercoats, Niton, Seaforth and Valentia radio-telegraph stations. It was in order to reach the smaller craft, says *The Times*, that the assistance of the British Broadcasting Co. was invited and immediately accorded. Its high-power station (5XX) will broadcast each morning at 10.30 a.m. (summer time) on a 1,600-metre wave the weather inference specially for shipping from Chelmsford and later on from the new station at Daventry, Northamptonshire. In the evening, between 10.20 and 10.35 p.m. (summer time), the service will be taken up by three local stations—Liverpool for the West Coast, Bournemouth for the South, and Newcastle for the East.

Radio in Hospitals.—Advisory Council Fund.—A meeting of the Advisory Council of the Wireless for Hospitals Fund was held on June 22nd in the board room of the British Broadcasting Co. Lord Knutsford presided. According to *The Times* the resources of the fund in money and material now amount to more than £14,000. A standard specification of hospital equipment drawn up by the technical members of the Council was submitted and approved. A report on the progress made in the equipment of the hospitals already approved was placed before the meeting. These include the London, St. Bartholomew's, and the Royal London Ophthalmic. Application for equipment has been made to the Council by a large number of hospital authorities in London. It was decided as a general principle that the largest hospitals, that is, those containing the greatest number of beds, should be equipped first, and among those approved by the Council are the following:—St. Thomas's, Guy's, Middlesex, St. George's, University College, St. Mary's, Paddington, King's College, Royal Free, Charing Cross, Westminster, Royal Northern, and London Temperance.

Wave-Length.—Geneva Conference.—An international conference will be held at Geneva on July 6th and 7th under the auspices of the newly established International Radiophone Bureau, of which Mr. A. R. Burrows is director, to try to secure agreement upon a wave-length system enabling European stations to operate without risk of mutual interference. A memorandum on the subject, including a scheme for future working, was recently drawn up by Capt. Eckersley, chief engineer of the British Broadcasting Co., and will form the basis for discussion. So that there shall be no delay in putting the recommendations of the Conference into operation, it has been timed to precede the Council meetings of the International Radiophone Union, which will meet at Geneva on July 8th and 9th.

Contracts Open and Closed.

(The date given in parentheses at the end of the paragraph indicates the issue of the "Electrical Review" in which the "Official Notice" appeared in our advertisement pages.)

Open.

Australia.—Sydney.—September 9th. New South Wales Railway Commissioners. One electric travelling jib crane and maintenance for 12 months. (A.X. 2,120.)*

July 27th. Municipal Council. One 5,000-kVA, 5,000/33,000-V step-up transformer; supply of gasfilled lamps. Specifications from the office of the Construction Engineer, Electricity Department, Town Hall, Sydney.

Melbourne.—August 3rd. Electricity Commission of Victoria. Switchgear and accessories.

September 14th. 3,000-kVA transformers and spares. Particulars from the Purchasing Section of the Commission, William Street, Melbourne.

Belgium. — July 15th. Belgian Post and Telegraph authorities at La Salle Madeleine, Brussels. Telephone cable, with accessories for Waremme, Hannut, Libramont, Bastogne, Saint Vith, and Theux.

July 16th. Municipal authorities of Schaerbeek, Brussels. Three h.p. automatic switches, two 3-phase transformers. Particulars from Service de l'Electricité, Hotel Communal, Place Colignon, Schaerbeek.

Bridgend.—July 31st. Penybont Rural District Council. Kenfig Hill electricity scheme. L.p. underground and overhead mains, transformers, switchgear, meters, and house wiring. (June 26th.)

Cupar (Fife).—July 8th. County Council. Electric lighting installation at new police buildings. Specifications from Mr. C. R. Douglas, surveyor, 15, East Street, Dunfermline.

Dundee.—July 17th. Electricity Department. Steam and exhaust pipes. (June 26th.)

(Continued on page 23.)

The I.M.E.A. Convention.

The New President.

THE election of Mr. R. B. Mitchell, M.I.E.E., engineer and manager of the Glasgow Corporation Electricity Department, to the office of president of the I.M.E.A. for the current year, is a timely recognition of outstanding merit. We naturally—and rightly—associate with the name of Glasgow the idea of sound and sagacious municipal government, a reputation which cannot be maintained without the support of a highly competent permanent staff; and in that respect the electricity undertaking has never fallen below the standard set by the city's traditions.

Mr. R. B. Mitchell was born and bred in Glasgow, and his career has been spent almost wholly in the service of the city. In 1898 he was appointed shift engineer in a battery station; he was promoted to shift work in the Waterloo Street works, when it was a generating station, and later was in charge of a shift at the Port Dundas electricity works, where after three years he was made resident engineer.

Mr. Mitchell's next move was to the mains department; he was appointed superintendent of mains, and for 12 years had sole charge of the transmission and distribution sides of the undertaking. Thus he acquired an all-round experience which eminently fitted him to become, in 1917, Deputy Chief Engineer and Superintendent of Stations; from that post it was an easy step to the position of Chief Engineer and Manager in 1920. Mr. Mitchell is fortunate in possessing in the highest degree the confidence of the Corporation which he has served so long, and in his personal acquaintance with every aspect of the great undertaking which he controls. He now stands at the head of a department which is in the front rank in respect of its efficiency and good management, and which is well equipped with plant to meet all requirements.

Photo by [*Ralston.*

Mr. R. B. Mitchell, President of the I.M.E.A.

Mr. Mitchell is a member of the Institution of Electrical Engineers, Past Chairman of the Scottish Local Centre of that Institution, a Vice-President of the Institution of Engineers and Shipbuilders in Scotland, and a member of the American Institute of Electrical Engineers. As a member of Council of the Incorporated Municipal Electrical Association he has been assiduous in the performance of his duties, having been present with his chairman, Dr. Dewar, at every one of the 11 meetings held during the past year, and it is certain that as President he will not spare himself, but will, like his predecessors loyally serve the Association to the utmost of his capacity. As one of the youngest heads of departments of the Glasgow municipality, he has, we hope, many years of active work before him, and in his hands neither the Association nor the Corporation need fear that its interests will be neglected or that its prestige will be allowed to fade.

Mrs. Atkinson, with Messrs. W. A. Brown and H. A. Nevill.

Mr. C. E. Newton, Ald. Taylor, and Mr. H. F. G. Woods.

The New President and Dr. Ferranti.

Mr. and Mrs. A. J. Fuller and Mr. and Mrs. A. J. Hedgcock.

F

The Electric Drive in Carpet Mills.

Messrs. Stewart Brothers' Eskbank Mills.

THE textile industry has ranked for many years as one of the leading industries in this country, and whilst much has been written on most of its branches, it is surprising that so little has been said about the carpet branch.

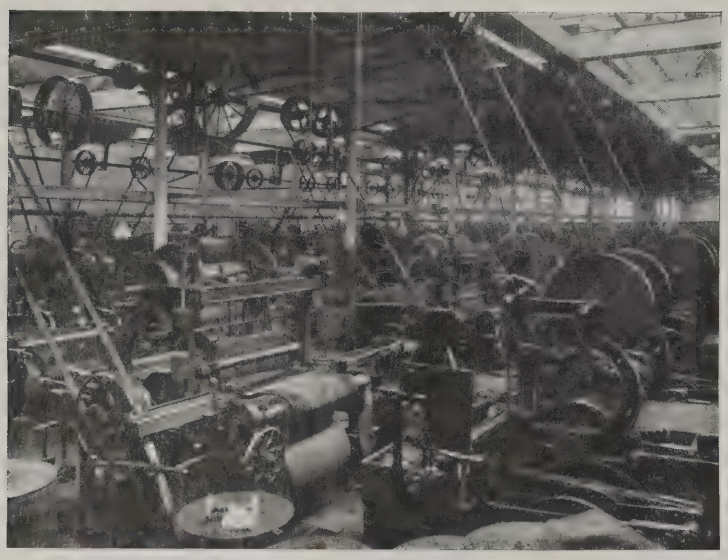

Fig. 1.—General View of Carpet-weaving Shed.

About 1540 an effort was made to manufacture carpets in this country, but it was not until 1600 that the industry was successfully established, mills being erected at Mortlake, in Surrey. It is interesting to record that, owing to the lack of skilled English labour, weavers had to be brought over from France to carry out the weaving operations.

The carpet industry is a highly specialised one, and for that reason it is of paramount importance that manufacturers should adopt the best machinery and most efficient means of driving it in order to meet the severe competition experienced from foreign countries, and the success of the electric drive as applied to the industry is a sure indication of the many advantages to be derived from it. New mills are being electrified throughout, and many of the older ones that have been converted have effected a considerable saving in cost, both with regard to running expenses and repairs, coupled with the superior convenience, improved quality of the product, safety, and other no less important merits of the electric drive.

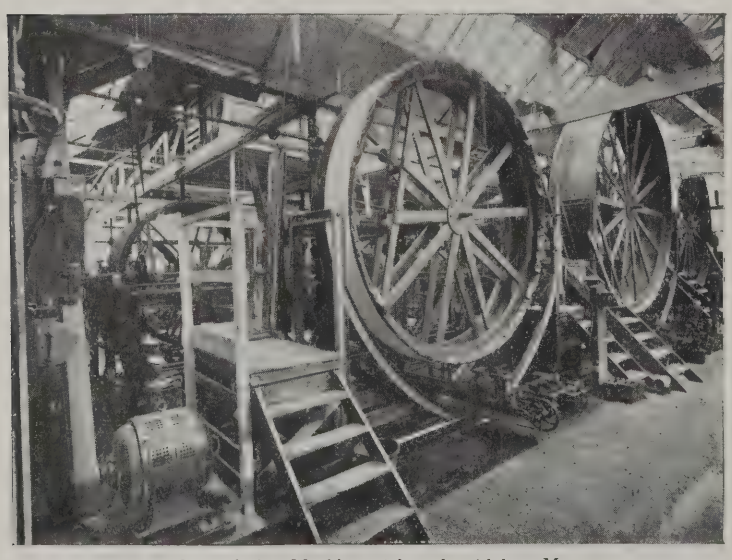

Fig. 2.—Printing Machines driven by 4-b.h.p. Motor.

An interesting example of the conversion from steam and gas to electric driving is the Eskbank carpet mills of Messrs. Stewart Bros., who produce tapestry and velvet pile classes of carpet by the method Mr. Whytock, of Edinburgh, invented in 1832 of printing the colours on the warp threads. The progressive order of the process is: Scouring the yarn, stoving, steeping in cold water, dyeing, winding on to bobbins, printing, steaming and drying, winding for the setters, setting, beaming, and weaving.

This Midlothian mill was originally driven by a steam engine and one gas engine, the shafting throughout the mill being driven through at least eight sets of bevel gears, which required constant lubrication and attention. The lighting was by gas with incandescent mantles. The boiler plant originally installed was condemned for the pressure for which it was designed, but it could still be used for producing the lower-pressure steam required for process work in the mill. Bearing the fact in mind that it was impossible to install new steam power plant without radical alteration of the mill buildings, it was decided to purchase electricity in bulk from the Lothians Electric Power Co. at 11,000 volts, 50 cycles, 3 phase, and adopt electric driving throughout.

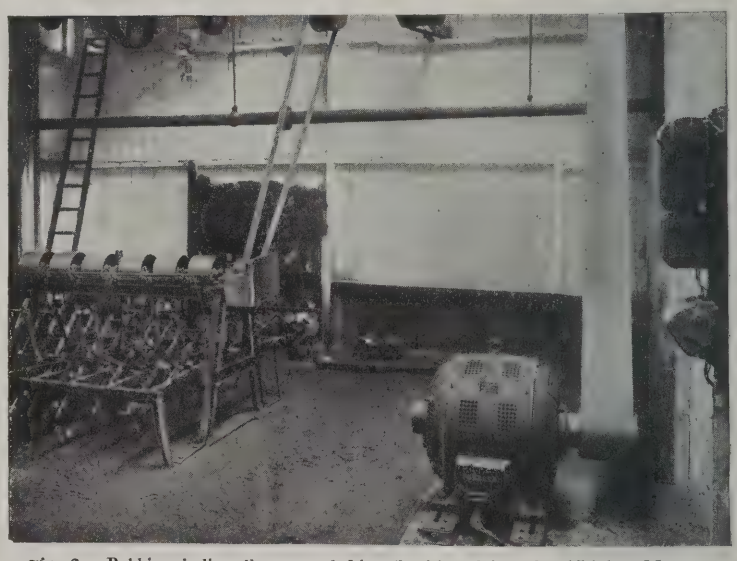

Fig. 3.—Bobbin-winding Frame and Line Shafting driven by 15-b.h.p. Motor.

A transformer house was erected near by, in which a 200-kVA Johnson & Phillips transformer is installed for reducing the voltage from 11,000 to 400 volts. The transformer is of the oil-immersed self-cooled type, and a sheet-steel cubicle has been installed for controlling the h.p. supply; another sheet-steel cubicle contains three kW-hour meters and three Hill-Shotter maximum-demand indicators, both cubicles being of Erskine Heap manufacture.

Operating in parallel on the low-pressure side of the transformer is a 125-kVA oil-immersed static condenser with auto transformer stepping up the l.p. from 400 to 600 volts and controlled by a Ferguson Pailin floor-mounted switch pillar. The object of this piece of apparatus is to improve the power factor of the system and, in order to prevent the condenser from supplying wattless current to the mains of the electricity

supply company when the mill is lightly loaded and thus increasing the maximum demand kVA; it is further controlled by a special automatic circuit breaker with jamming relay made by the Igranic Electric Co., which automatically cuts out the condenser when the load falls below a predetermined figure and inserts it again when the load rises above a certain figure.

The l.p. supply from the transformer is controlled by distribution switches and fuses, there being one set

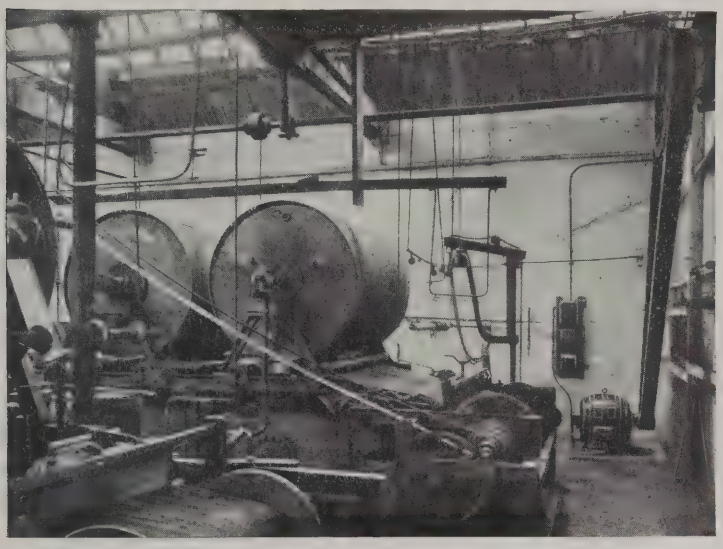

Fig. 4.—Dressing Drums driven by 7½-b.h.p. Motor.

for each department in the mill. From the distribution board, three-core armoured cables are run to sub-distribution boards throughout the mill and from the latter to sub-distribution ironclad fuseboards, whence the circuit wiring in tubing is run to the various motors and control gear.

The motors, which were manufactured by Messrs. Bruce Peebles & Co., Ltd., of Edinburgh, are of the squirrel-cage induction type, fitted with textile enclosing covers, the construction of which is such that any fluff which may gather round the apertures can be easily wiped off. The advantages in favour of this type of motor are its extreme flexibility as regards pressure, steady running, and small speed variation from no load to full load.

Fig. 1 is a general view of one of the weaving sheds, which is driven on the subdivided group system by three 10-b.h.p., 472-r.p.m., Peebles induction motors, while fig. 3 depicts a 15-b.h.p., 475-r.p.m., motor

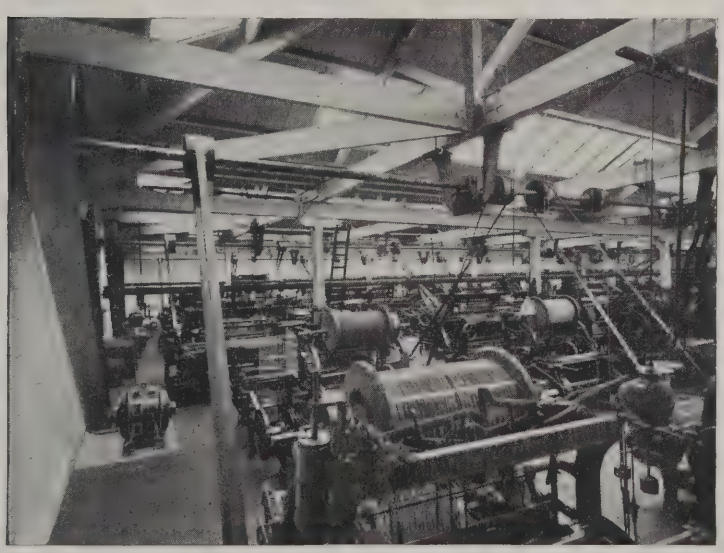

Fig. 5.—Weaving Shed, Group-driven by three 15-b.h.p. Motors.

driving bobbin-winding frames and line shafting; the star-delta starting switch is clearly shown on the wall on the right of the picture. Fig. 2 illustrates the printing machines, driven by a 4-b.h.p., 567-r.p.m. motor, which are of particular interest.

An examination of the illustration will show that the construction of these printing machines is very simple, each merely consisting of a large lightly-constructed drum, a part of the periphery of which is collapsible to allow of the yarn being removed after printing, and a movable wheeled dye-trough situated underneath the drum. On the operators' platform a printers' board will be seen suspended by a cord, the respective colourings of the warp threads being indicated on this board by suitable colour signs which correspond to the figuring on the edge of the drum.

White yarn is run on to the drum of a length corresponding to the length of five or six pieces of carpet, according to the number being run off; the trough is next charged with a dye of the required colour, and the printing process begins. The trough, which is mounted on a small railroad, is fitted with a roller having its periphery formed of vulcanite, and this roller revolves partly in and partly out of the trough, somewhat after the fashion of a lawn marker. The trough is set in motion, moving in the direction of the axis of the drum, and in doing so the roller leaves an impression on the warp threads of a width corresponding to the width of one elongated stitch; the drum is then moved

Fig. 6.—Three 10-b.h.p. Motors driving Weaving Shed shown in Fig. 1.

round to a position indicated by the printers' board, and the process repeated. When a change of colour is required it is only necessary to replace one trough by another, a number of which are allocated to each machine. When the run of yarn has been completely printed in the required colours, it is removed and forms one thread of the warp of five or six pieces of carpet according to the length. Fresh white yarn is now run on and dyed, thus forming the second thread of the warp.

After leaving the printing machines the warp threads are steamed and dried, this process ensuring that the dyes fully enter the pores of the yarn; fig. 4 shows the dressing drums, which are driven by a 7½-b.h.p., 472-r.p.m. motor. The warp threads are next placed on setting frames, the various threads being arranged in relation to one another according to the design; when this is being done, the pattern may be seen taking form. The warp being now set, it is wound on beams or rollers and is ready for the weavers. Fig. 5 depicts one of the

weaving sheds, driven by three 15-b.h.p. motors, whilst fig. 6 shows three 10-b.h.p. motors driving the weaving shed shown in fig. 1.

Illustrations 7 and 8 are two views of the drying drums and brushing machine, driven by a 10-b.h.p. motor, used for cleaning and drying the surface of the carpets. All the motors are sufficiently protected by substantial metal guards which, having been removed so as not to obscure the photographs, are not shown in the illustrations.

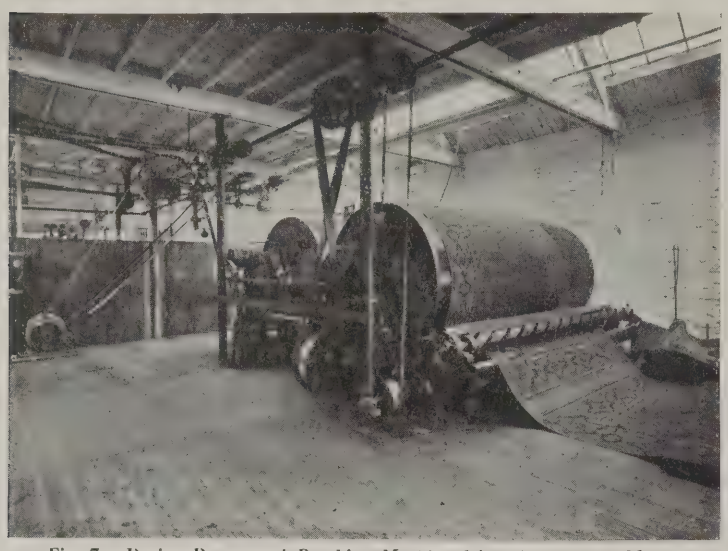

Fig. 7.—Drying Drums and Brushing Machine driven by 10-b.h.p. Motor.

The arrangement of group driving throughout the mill was adopted to avoid alteration to existing driving arrangements, and it is interesting to note that the change-over to electricity was effected without any reduction in the working time of the mill. To enable this to be done, the whole electrical equipment was installed before the steam and gas power was cut off and, group by group, the change-over was effected during meal hours and one or two evenings, it being only necessary in many instances to remove the bevel pinions.

The lighting of the mill, of course, is by electricity; supply is obtained from the neutral point and each of the phases of the low-pressure side of the transformer, the voltage obtained between the neutral point and any one of the phases being 230 V. The lighting load is divided as equally as possible between the three phases, and the three lighting boards control the circuits to sub-distribution boards throughout the mill, and they are connected by twin armoured cables. The connections from the sub-distribution boards to the lighting switches are run in tubing. The lighting is worthy of note in that an effort has been made to illuminate individually each process and to provide uniform light throughout in so far as it is possible to do so in such mills. At a recent social gathering the chairman of the Workers' Committee expressed his view to the management that nothing so beneficial in the history of the company had been done for the workers to compare with the new lighting.

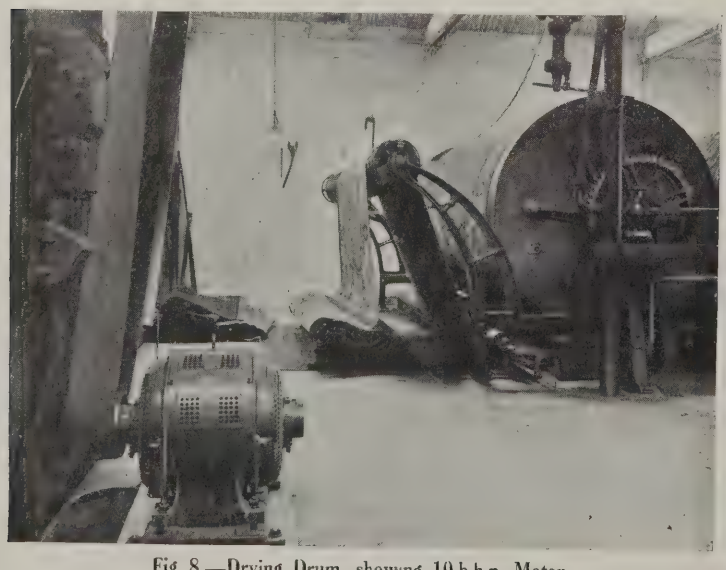

Fig. 8.—Drying Drum, showing 10-b.h.p. Motor. (Note Starting Switches on Wall.)

Summarising briefly the various advantages resulting from the electrification of a carpet mill, it may be said that any portion of the mill not in use may be shut down without interfering with the rest of the plant, thereby effecting a considerable saving in power, which would otherwise be wasted in running idle line shafting. Moreover, a mechanical or electrical breakdown would be entirely confined to its own section, all other sections proceeding as usual while repairs were being carried out. Individual sections of the mill can be run on overtime without that waste of power which is brought about by running the whole mill for the sake of a few machines, while power costs may be checked at any desired moment.

The introduction of machinery into the carpet-making industry, and the increased production consequent thereon, has had the effect of considerably reducing the cost of carpets, thus bringing them within the means of everyone. Many mills are still driven by antiquated steam engines, although the cost of converting a mill to electric driving is more than compensated for by the saving in running expenses and other advantages which accrue from electrical operation. In view of what the use of electricity has done in other branches of the textile industry, carpet manufacturers should have no difficulty in appreciating its merits as the most efficient means of driving factory machinery. When considered in conjunction with the more healthy, clean, and less noisy conditions under which the employés are enabled to work, the day would seem to be not far distant when those facts will be generally recognised, not only in all branches of the textile trade, but in every industry that makes use of power-driven machinery.

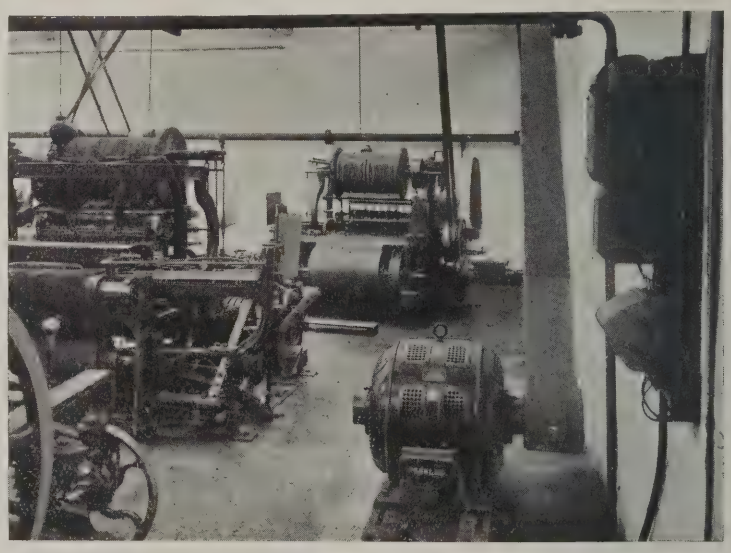

Fig. 9.—A 15-b.h.p. Motor driving Carpet Looms.

In conclusion, it should be mentioned that the complete electrical installation described above was carried out by the agents of Messrs. Bruce Peebles & Co., Ltd., Messrs. Mitchell, Graham & Son, Ltd., of Edinburgh, who were responsible for the execution of the whole of the work.

Contracts Open and Closed

(*Continued from page 18.*)

Open.

Colchester.—July 10th. Education Committee. Installation of electric lighting at St. John's Green Council school. Specification from the Borough Electrical Engineer (Mr. Wm. Frisby).

Edinburgh.—July 9th. Education Authority. Electric lighting installation at three schools. Schedules from the Executive Officer, Education Offices.

July 13th. Electricity Department. Installation of electric lighting at the public wash-house, Abbeymount, Edinburgh. Specifications from Engineer, Dewar Place.

Egypt.—CAIRO.—July 9th. Director of the Section of Local Municipalities and Commissions (Savoy House), Cairo. Supply and installation of an electrical system at Zifta.

Inspecting Engineer in London. 3,000 metres submarine cable, underground cables, 10 tons line wire, bolts and nuts, &c.—*Reuter's Trade Service* (Cairo).

Fife.—July 6th. Education Authority. Electric lighting work in connection with the addition to Leslie Public School. Schedules from Master of Works, Fife Education Authority, Kirkcaldy.

Grimsby.—July 4th. Electricity Department. 15,000 yd. p.i.l.c. l.p. cables. (June 19th.)

Hemsworth.—July 6th. West Riding Education Committee. Electric lighting at Council School. Specifications, &c., from Education Department, County Hall, Wakefield.

India.—SIMLA.—July 20th. Indian Stores Department. Diesel-engine alternator sets, water-cooling units, oil fuel storage tank oil-purifier equipment, 10-ton overhead crane, switchboard, cables, transformers, e.h.p. feeder cables, &c.*

Littleborough.—July 8th. Urban District Council. 6,600-V cables, roadwork, &c., transformer, switchgear, and cable connections for new sub-station. (June 19th.)

London.—H.M. OFFICE OF WORKS.—July 9th. One 110-V, 3,500-Ah secondary battery for the National Physical Laboratory, Teddington. (June 26th.)

BATTERSEA.—July 21st. Electricity Department. One 10,000-kW turbo-alternator, with condensing plant, switchgear, and two 65,000-lb. per hour boilers, with pipework and ash-handling plant. (June 19th.)

STEPNEY.—July 8th. Board of Guardians. Electrical fittings for two months. Forms of tender from Mr. F. J. Tootell, Guardians' Offices, 74, Vallance Road, Whitechapel, E.1.

LEWISHAM.—July 6th. Board of Guardians. Installation of electric clocks at the Hospital, High Street, Lewisham, S.E. (June 26th.)

Loughborough.—July 9th. Poor Law Institution. Installation of electric lighting at the Institution. Plans and specifications from Mr. E. G. Phillips, consulting engineer, Queen's Chambers, King Street, Nottingham.

Lymm.—July 13th. Urban District Council. Electrically-driven centrifugal pump. Particulars from Mr. N. Holt, clerk to the Council, Council Offices.

Manchester.—July 9th. Board of Guardians. Electrical equipment, comprising rotary converters, transformers, and control panels at Booth Hall Infirmary, Charlestown Road, Blackley. Particulars from Mr. E. Hargreaves, superintendent of works, Union Offices, All Saints, Manchester.

July 16th. Electrically-driven booster pumping plant at Booth Hall Infirmary. Particulars from Mr. E. Hargreaves, Union Offices.

July 20th. Electricity Department. Electric cooking ranges and switches and cut-outs for 12 months. (See this issue.)

New Zealand.—WELLINGTON.—July 21st. Public Works Department. Two electrically-operated water-level indicators.*

August 18th. Posts and Telegraph Department. Switchboard plugs.*

INVERCARGILL.—Electricity Department. 2,200 ft. .1 sq. in. 11,000-V cable; 80 ft. .3 sq. in. 3,300-V cable and spares.*

August 17th. Four 667-kVA single-phase transformers.*

Skipton.—July 10th. Electricity Department. L.p. cable. (June 26th.)

Stoke-on-Trent.—July 7th. Electricity Supply Department. Two 25-kVA transformers and electrically-driven grab crane. (June 19th.)

Switzerland.—July 11th. Swiss Federal Railway authorities, Berne. Installation at the Vernayaz hydro-electric station of two 250-kVA single-phase transformers and two of 75-kW capacity. Particulars for 10 fr. from Abteilung für Elektrification, Dienstgebaude, Zimmer 164, 43, Mittelstrasse, Berne.

Tunbridge Wells.—July 8th. Electricity Committee. One 3,000-kW turbo-alternator, with condenser, piping, and cables, one cooling tower, steam piping, &c. (June 5th.)

Uruguay.—MONTEVIDEO.—July 28th. State Electricity Supply Works. 15 equipments (switchboard, feeder cubicle, &c.) for transformer sub-stations.*

West Ham.—July 20th. Education Committee. Wiring of eight schools. (June 26th.)

*Further particulars can be obtained at the Department of Overseas Trade (Inquiry Room), 35, Old Queen Street, S.W.1.

Closed.

Australia.—SYDNEY.—City Council. Electricity Committee. Split-conductor feeder panels (£2,236); h.p. switch panels for 5,000-V and 10,000-V sub-stations (£10,745).—Ferguson, Pailin, Ltd.

Rubber insulated cables.—Nine tenders were received, all quoting the same price (£2,400). The Committee recommended the Council to eliminate from the list the names of the Australian General Electric Co. Ltd., and the British General Electric Co., Ltd., and that the general manager be authorised to accept the most suitable tender from the remaining offers.

50-ton electrically-operated travelling crane.—Andrew Thompson and Scougall.

L.p. oil-switch transformer panels (£3,738).—Metropolitan-Vickers Electrical Co., Ltd. —*TENDERS.*

Belgium.—Five Belgian and one British concern (the British Insulated & Helsby Cables, Ltd., Prescot) submitted tenders last week to the Société Nationale des Chemins de Fer Vicinaux, Brussels, for the supply and laying of a quantity of underground h.p. cable. The quotations ranged from 316,372 to 400,258 francs, the lowest being that of the Société des Cableries et Corderies du Hainaut, of Dour.

Bournemouth.—Tramways Committee. Accepted:—

Generating and condensing plant (£11,248).—W. H. Allen & Co., Ltd.
Supply and erection of cooling tower (£3,260).—Premier Cooler and Engineering Co.
Two water-tube boilers (£8,680).—Babcock & Wilcox, Ltd.

Brighton.—Lighting Committee. Accepted:—

Cable.—(£2,621), Siemens Bros. & Co., Ltd.; (£269), W. T. Henley's Telegraph Works Co., Ltd.; (£3,499), Macintosh Cable Co., Ltd.

Tramways Committee. Accepted:—

Three single turnouts (£155, £149 and £162).—Hadfields, Ltd.

Burslem. — Territorial Army Association. Recommended:—

Electric light fittings for the drill hall, &c.—Blackburn, Starling & Co.

Dorchester.—Lighting Committee. Recommended:—

Feeder cable (£721).—Johnson & Phillips, Ltd.
Feeder panel.—General Electric Co., Ltd.

Glasgow.—Health Committee. Recommended:—

Electric lighting work at Mearnskirk Sanatorium (£2,723).—Andrew Hutcheson, Ltd.

Corporation Tramways Committee. Recommended:—

Trolley wire.—R. Johnson & Nephew, Ltd.
Block nuts.—P. & W. MacLellan, Ltd.
L.c. cable.—Western Electric Co., Ltd.
Armature-banding lathe.—Midland Dynamo and Motor Repairs Co., Ltd.
Steel tires.—Steel Co. of Scotland.

Halifax.—Tramways and Electricity Committee. Recommended:—

Tenders in connection with the Halifax-Huddersfield linking-up scheme:—

Switchgear (£3,024).—British Thomson-Houston Co., Ltd.
E.h.p. cable, pilot and telephone cables (jointly with Huddersfield Corporation).—British Insulated & Helsby Cables, Ltd.

London.—LONDON COUNTY COUNCIL.—Accepted:—

4 arc-welding plants (E.L. type) for the Tramways Department.—Equipment and Engineering Co.
Six months' supply of dry cells.—Edison Swan Electric Co., Ltd.

METROPOLITAN ASYLUMS BOARD.

The following tenders were received for installation of electric light at High Wood Hospital for Children:—

Smethurst & Co. (London), Ltd.	£2,589
C. F. Williams	2,920
Coley & Swinnerton, Ltd.	3,000
T. Clarke & Co., Ltd.	3,100
A. Hawkins & Sons	3,100
Read & Partners, Ltd.	3,153
Power Contracts, Ltd.	3,431
W. H. Gaze & Sons, Ltd.	3,511
Griggs & Son	3,625
G. A. Weston	3,995
W. E. Heath & Co.	7,750

GENERAL POST OFFICE. Accepted:—

One special double-output 2-kW generating set, with twin-cylinder vertical gas engine, for the automatic telephone exchange at Oughtibridge, near Sheffield.—Stuart Turner, Ltd.

Manchester.—The Corporation Tramways Committee last week decided to recommend the Council to sanction the acceptance of the tender of the United Steel Products, Ltd., at £4,800 for special track material; the figure, it is stated, is about £200 less than the lowest British tender. According to the *Daily Dispatch*, there was some opposition at the meeting of the Tramways Committee to the contract going outside the country, but there was only a small attendance of members.

Electricity Committee. Accepted :—

Cable.—British Insulated & Helsby Cables, Ltd.; Macintosh Cable Co., Ltd.; F. Smith & Co.; Callender's Cable & Construction Co., Ltd.
Pipes and flanges for soot blowers.—Wellington Tube Works, Ltd.
E.h.p. cables linking the Barton station with supply area.—Callender's Cable & Construction Co., Ltd.

Central Purchasing Committee. Accepted :—

Incandescent electric lamps.—Metro-Vick Supplies, Ltd.; Edison-Swan Electric Co., Ltd.; British Thomson-Houston Co., Ltd.; Siemens and English Electric Lamp Co., Ltd.; British Insulated & Helsby Cables, Ltd.; General Electric Co., Ltd.; Stella Lamp Co., Ltd.

Housing Committee. Accepted :—

Electric light installation at Blockley housing estate.—J. Armstrong and Co., Ltd.

Plymouth.—Electric Committee. Accepted:—

Motor converter and switchgear for Newport Street (£7,450).—General Electric Co., Ltd.

Portsmouth.—Board of Guardians. Accepted :—

Electrical fittings.—General Electric Co., Ltd.

Salford.—Electricity Committee. Accepted :—

Removal of the d.c. lighting and power board at Frederick Road power station, including new rotary panels (£1,870).—Bertram Thomas.
Cable (£2,674).—W. T. Glover & Co., Ltd.

South Africa.—CAPE TOWN.—Electricity Committee. Recommended :—

Six tons copper wire (£525); cable (£157).—Telegraph Mfg. Co., Ltd.
Seven transformers (£1,225).—General Electric Co. of America.
Circulating-water equipment (£126).—Griffin Engineering Co.
Two Ferranti transformers (£150).—Rice & Wiethelm, Ltd.
Cables (£2,040).—W. T. Henley's Telegraph Works Co., Ltd.

Stoke-on-Trent.—Electricity Committee. Accepted :—

Three switchgear panels at Hanley sub-station (£300).—A. Reyrolle and Co., Ltd.

Sunderland.—River Wear Commission. Accepted:—

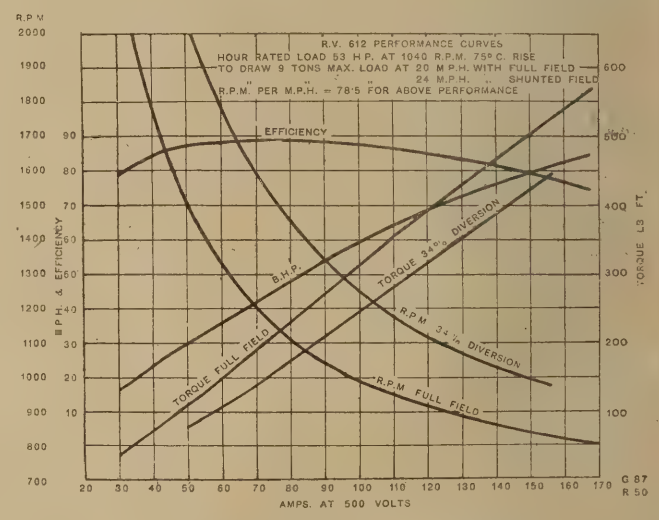
Two sets of hydraulic pumps, with electric motors, automatic, electric, and hydraulic control gear (£2,042).—Fullerton, Hodgart & Barclays, Ltd.

Forthcoming Event.

Faraday Society.—Monday, July 6th. At Burlington House, W. At 5.15 p.m. Annual general meeting.

Notes.

The United States and Canadian Water Power.—Sir Adam Beck, chairman of the Hydro-Electric Power Commission of Ontario, has made a strong protest against the proposed leasing of a water-power site at Carillon on the Ottawa River to American interests. He states that Ontario is faced with the prospect of a severe power shortage and consequently needs every water-power that can be developed. Although it is stated that the potentiality of the Carillon project is only 200,000 h.p., permission is sought for the export of twice this amount of power. Sir Adam states that at present the Canadian people have a safeguard in the matter of exported power; notices are served annually on users of Canadian-produced power, pointing out that the power is only being exported until such times as it is needed in Canada. He avers that the concession seeks to destroy this safeguard.



The Aurora Spectrum.—Prof. McLennan recently announced, at the Royal Society, that he had determined the conditions that give rise to the peculiar green line found in the spectrum of the Aurora Borealis. This knowledge may be of the greatest value in elucidating the problem of the transmission of "wireless" waves around the world. Photographs of the spectrum of the Aurora Borealis have been taken by numerous workers, and in the spectra obtained there has always been a green line amongst the bands at a definite point. Lord Rayleigh identified the bands with the spectrum of nitrogen, but the green line remained a puzzle, having never been reproduced in the spectrum of any element, nor in the spectra of compounds of elements in laboratory experiments. The green line was obtained recently at Toronto by the Professor and his co-worker, Dr. Shrum, in the spectrum of oxygen and helium, with the latter in excess. One peculiarity of the green line was that it could be obtained on almost any night from the light of a cloudless sky. Prof. McLennan now shows that the green line spectra ordinate in highly rarefied oxygen, and that the intensity is gradually enhanced when helium is added to the oxygen. The Aurora light comes from a region some 60 or 100 miles above the earth, and the origin of the green line indicates that at this height the atmosphere contains 20 to 30 times as much helium as oxygen.—*Morning Post.*

The Electrical Engineers' Ball.—We are pleased to learn that owing to the success of the Electrical Engineers' Ball, held in February, the Committee has been able to distribute out of the surplus funds the sum of £70 each to the I.E.E. Benevolent Fund and the Electrical Trades Benevolent Fund.

Electric Transmission from Norway to Denmark.—Dealing with this oft discussed problem, Mr. Angelo, manager of the North Jutland Electricity Supply Works, before the annual conference of the Danish Electricity Works Association held in Copenhagen on June 16th, put forward six alternative schemes, each of which would involve an expenditure of about 50,000,000 kronor. One project suggested the construction of two high towers in the Sound for the suspension of the aerial conductors. The transmission by means of submarine cables would result in a lesser outlay, but the author stated that some of the power would thereby be lost. In his opinion the former scheme, although it might be delayed many years, would be carried out eventually. The expenditure should not be borne solely by Denmark, but also shared by Norway and Sweden.

Deterioration of Fibrous Insulating Materials.—We have received details of experiments carried out at the the Institute of Physical and Chemical Research, Tokio, on some fibrous insulating materials in order to determine the effect of temperature on the deterioration of such materials. The rate of deterioration of the insulating materials by heat was measured by the amount of decomposed gases, or by the weight decrease of the material, which is commonly known as the thermal decomposition or carbonisation. Curves plotted from the results of the experiments show that with cotton the weight of material fell to 90 per cent. in 1,250 hr. at 165 deg. C., and to 35 per cent. in 200 hr. at 205 deg. C.; with filter paper to 90 per cent. in 550 hr. at 165 deg. C., and 30 per cent. in 70 hr. at 223 deg. C.; with linen to 90 per cent. in 1,000 hr. at 165 deg. C., and 45 per cent. in 80 hr. at 215 deg. C.; with manila paper to 95 per cent. in 700 hr. at 145 deg. C., and 34 per cent. in 6 hr. at 265 deg. C.; with silk to 97 per cent. in 1,350 hr. at 125 deg. C., and 60 per cent. in 4 hr. at 265 deg. C.; and with empire cloth to 97 per cent. in 460 hr. at 105 deg. C., and 60 per cent. in 16 hr. at 265 deg. C.

Trolley 'Buses for Shanghai.—We have been informed, subsequent to the publication of the article, "Trolley 'Buses for Shanghai," in our columns of June 12th, that the curves shown in fig. 1 of the article represent the performance of a 9-ton vehicle; and it should be made quite clear that they are not the performance curves of the Shanghai vehicle. The 9-ton vehicle is driven by a single "Bull" motor, the performance of which is shown in the accompanying curves. The motor is rated at 53 h.p. at 1,040 r.p.m., with 75 deg. C. rise in temperature; it will draw 9 tons maximum load at 20 m.p.h.

Performance Curves for "Bull" Driving Motor.

with full field, and 24 m.p.h. with the field shunted, the r.p.m. per m.p.h. being 78.6 for this performance. It should also be noted that the acceleration of 2.5 m.p.h. per sec. referred to in the article is the starting acceleration of the 9-ton vehicle.

The London Electrical Engineers.—27TH A.A. BATTALION R.E. (T.A.). Honorary Colonel, Col. R. E. B. Crompton, C.B.; Officer Commanding Lieut.-Col. C. H. S. Evans, O.B.E., A.M.I.E.E. The following orders have been issued for July :—

304th Company (Major W. H. Merrett, T.D., A.M.I.E.E.).—Mondays, 7 p.m. to 9.30 p.m. H.Q., Royal School of Mines, and Hyde Park. Musketry, Rainham Ranges, July 12th, 12 noon.

305th Company (Major A. W. Mawby, O.B.E., A.M.I.E.E.).—Tuesdays, 7 p.m. to 9.30 p.m. H.Q., Royal School of Mines and one mobile station. Musketry, Rainham Ranges, July 12th, 3.30 p.m.

306th Company (Major F. C. Clarke, A.M.I.E.E.).—Fridays, 7 p.m. to 9.30 p.m. H.Q., Hyde Park and Royal School of Mines. Musketry Rainham Ranges, July 26th, 12 noon.

Two officers and detachment of twelve lights at Wembley throughout the month.

Railway Station Lighting.—Trains on a south-western United States railroad, upon approaching certain of the very small stations, actuate an electrical relay by touching a mechanical device on the track and thereby light the station lamps. As they reach a certain distance in departing from the station, they turn the lights out.

New Process for Platinum Extraction.—According to the *Financial News*, a Pietersburg man has invented plant for the extraction of platinum and the treatment of refractory ores, which, it is claimed, has satisfied prominent mining men as to its practicability. It is reported that tests prove that platinum, iridium, gold, silver and base metals, can be completely dealt with. The cost of the treatment is estimated at 2s. per ton, exclusive of technical and labour costs. Tests with Lydenburg and Waterberg platinum ores have given good results, and there are prospects of an improvement of the process which will be within the reach of small capital.

Since the discovery of platinum-bearing reefs in the Lydenburg district, there have been a number of reports of occurrences of this valuable metal or of the rocks in which it has recently been found, at widely separated points in Southern Africa.

It is interesting to note that these reports all refer to areas which lie fairly close to the same meridan, and are, therefore, parallel to what remains of the western scarp of the Rift Valley. If this is not merely a coincidence, platinum-bearing rocks may yet be found still further to the north in Northern Rhodesia and Tanganyika Territory, and possibly in other Central African territories as well.

The I.E.E. in China.—We have received from Mr. C. S. Taylor, the honorary secretary and treasurer of the China Centre of the Institution of Electrical Engineers, a recent photograph of the members of the Centre; this is reproduced herewith. The occasion was a conference which was held in Shanghai on May 1st and 2nd. A number of technical matters were discussed and the conference closed with a dinner at which the chairman, Mr. T. H. U. Aldridge (chief engineer of the Shanghai Municipal Electricity Department), gave an interesting address upon the failure, in 1923, of a 20,000-kW turbine in the power station which is under his supervision. He also spoke of the effect of superheated steam upon the casings of two 18,000-kW turbines at the same station. Among other matters dealt with in the address were questions relating to turbine design, particularly with regard to investigations made into the "fluttering" of turbine wheels.

The following is a key to the members who appear in the photograph :—

Back row : A. J. Percival, N. Denison, H. J. Moysey, R. A. E. Denton, T. Oliphant, H. J. Gwyther, G. Finlay, O. L. Ilbert, A. D. Buchanan, R. L. Evans, L. Beaumont, S. Y. Chang, V. Rose, A. S. Phillips, J. E. M. Barnes.

Front row : E. A. Mills, P. H. Cole, F. S. Heys J. S. S. Cooper (vice-chairman), T. H. U. Aldridge (chairman), F. R. Scott (guest), C. S. Taylor (honorary secretary and treasurer), C. M. Perrin, Dr. H. Chatley (guest).

A Conference of Electrical Engineers at Shanghai.

Civil Service Commission.—FORTHCOMING EXAMINATIONS FOR ASSISTANT ENGINEER AND FOR INSPECTORS IN THE ENGINEERING DEPARTMENT OF THE GENERAL POST OFFICE.—The latest date for the receipt of application forms for assistant engineer is July 30th, and for inspectors in engineering August 27th. Particulars and forms of application can be obtained from the Secretary, Civil Service Commission, Burlington Gardens, W.1. (See our advertisement pages to-day.)

E.A.W. Showroom Visit.—On Friday afternoon, June 26th, a large party of members of the Electrical Association for Women visited Mazda House, Oxford Street London, where a keen interest was displayed in the domestic cookers, washing machines, and also the wireless apparatus. Short talks were given by members of the B.T.-H. staff on the "Domestic Application of Electricity" and "Battery Charging," after which the members were entertained to tea.

Artificial Waterfall for Hydro-Electric Scheme.—*Power* says that a project for supplying the north-eastern provinces of Spain with electric power, originally planned and financed by Mr. Pearson, a Canadian banker who perished on the *Lusitania*, provides for the construction of a large artificial waterfall at the town of Mequinenza on the River Ebro. The big artificial lake will also be used for an irrigation system in the surrounding districts.

International Tramway Congress.—The third congress of the International Tramways and Light Railways Union was held in Budapest from June 21st to 25th. In connection with the congress an exhibition of appliances, &c., was held and delegates paid a visit of inspection to the electrified portions of the State railways.

Modern Stage Lighting.—On June 23rd, members of the Illuminating Engineering Society paid a visit to Drury Lane Theatre, by the courtesy of Sir Alfred Butt, and Mr. H. Mather, the electrical engineer in charge, demonstrated the lighting arrangements. The very large stage at Drury Lane receives illumination by many methods and lamps of historic interest are used side by side with those of the latest pattern. Thus, the overhead lighting could be furnished by the conventional battens of coloured lamps; but in addition gasfilled lamps in concentrating reflectors, equipped with gelatine screens giving a varied series of colours are in use. Spotlight projectors at the side are likewise furnished with rotating screens equipped with coloured diaphragms, and in the wings limelight projectors are still used and give a powerful light, though projectors using electric incandescent lamps are being experimented with as well. Arrangements have also been made for the more recent form of projection of light, from arcs above the gallery. Other special units for the illumination of scenery were shown in operation an interesting feature here being the use of batteries of cylindrical fittings, each provided with tubular gasfilled lamps specially constructed for the purpose.

Following the visit members adjourned to Magnet House, by the invitation of the General Electric Co., Ltd., where a discussion on "Stage Lighting" took place. Major A. Klein pointed out the great possibilities of modern methods, involving the use of colour and the projection of pictures, alluding to such devices as the recent accompaniment of concerts by the Clarilux colour-organ, and the spectacular effects contrived by Mr. A. Samoiloff at the London Hippodrome. As soon as managers realised the possibilities of modern apparatus they would be willing to make the necessary expenditure, but at present this presented one of the chief difficulties in getting new methods taken up. Other speakers referred to the need for co-operation between the manager, the actor, and the illuminating engineer, and Mr. L. Gaster, in returning thanks to the General Electric Co. for its hospitality, recalled that Mr. Fagan, in a paper read before the Society some years ago, had emphasised the important part played by lighting on the stage. The Society was anxious to do everything possible to promote co-operation between the producer and the lighting expert and he agreed that the stage presented a great opportunity for the services of the illuminating engineer.

Electrification of Sicilian Sulphur Mines.—According to *Chemical and Metallurgical Engineering*, an important electric power development is expected to have government encouragement, as induced by the intensive production policies of Signor Mussolini, in connection with the Sicilian sulphur industry, in which, hitherto, few progressive methods have been employed. The industry covers an area of approximately one-fifth of the island, and employs about 20,000 workers.

An Electrically-operated Open-Pit Coal Mine.—What is claimed to be the first completely electrified open-pit coal mine in the United States at the new town of Colstrip, approximately 35 miles south of Forsyth, Montana, with a coal bed about 180 acres in extent and 25 ft. deep, is owned by the North-western Improvement Co., and is being worked by Messrs. Foley Brothers, general contractors, of St. Paul, Minnesota. The coal is sub-bituminous with a heat content of 11,000 B.th.u., and will be used for the locomotives of the Northern Pacific Railroad in Montana. In order to utilise electricity in mining the coal, an extension of the Montana Power Co.'s 55,000-volt transmission line was made to supply the electrical equipment for stripping the overburden from the coal, mining the coal itself, and hauling. The equipment consists of a Marion model No. 360 electric shovel with a 155-ft. boom and six-yard bucket, used as a drag-line excavator for stripping; a Bucyrus model No. 175-B coal-loading shovel, and two 60-ton electric storage-battery locomotives. The locomotives are the largest storage-battery units which the General Electric Co. has built. They are equipped with Exide ironclad lead batteries of a special size and include a motor generator in the cab of each for charging. During the time spent at the shovel while the cars are being loaded, a flexible cable from a bank of transformers on the shovel is plugged into the locomotive for charging. While coal is being mined from one strip, the overburden is being removed from the next and is cast into the excavation resulting from the removal of the coal.

"Wireless" Motion Pictures.—According to Press reports from America, motion pictures of a windmill in action were projected, with the aid of radio, on a screen five miles away. The inventor, Mr. Francis Jenkins, of Washington, predicted that his apparatus would be sufficiently refined in a year's time to make wireless motion pictures practical for commercial use.

Appointments Vacant.—Plumber-jointer, for Harwich Corporation electricity department; shift engineers, for the Penang Municipal Commission ($325 per month+; dollar= 2s. 4d.); second clerk in Borough of Colne electricity and tramways department. Junior technical assistant (£279) for the R.A.E.S., Farnborough. (See our advertisement pages to-day).

Imperial College of Science and Technology.—The Appointments Board of the College invites employers requiring men who have received a thorough training in the principles of engineering and who have obtained the diploma of the City and Guilds (Engineering College) to make use of the services of the Board. (See our advertisement pages to-day.)

Electricity Representation at Motor Exhibition.—The accompanying illustration is of a 2-ton electric lorry which the Glasgow Corporation Electricity Department had fitted up to represent a house as an exhibit in a parade of motor vehicles held in Glasgow on June 6th. The imitation brickwork foundation of the house was in red, and was overprinted with advertising matter relating to a hire-purchase scheme of wiring houses which the Glasgow Corporation has adopted. The exhibit proved a success.

Glasgow Corporation Exhibition Vehicle.

Sir David Salomons's Bequests. — According to the *Daily Telegraph*, the late Sir David Salomons, Bt., under his will, to which brief reference was made last week, left £5,000 to Gonville and Caius College, Cambridge, for extending the college buildings, and £1,000 in augmentation of the Salomons Scholarship Fund to enable the College to give this scholarship more frequently or for longer terms of tenure. To the Royal Institution he left his large magnet (designed by him and known as the Broomhill Magnet), and all the apparatus belonging to it, which enables the magnet to be used, amongst other things, as a polariscope, and for other purposes. His tube of radium and any other capsules of radium are bequeathed to his widow. Subject to his widow's interest, he left to the University of Cambridge all his scientific instruments and medical apparatus properly belonging to the workshops or laboratories and theatre, his collection of crystals and other apparatus used for polariscope work, &c.

Electricity for Air Compressors on Ships.—According to *Power*, the Ford Motor Co. is having the *East Indian*, one of the Shipping Board's steam propelled boats, converted to Diesel propulsion for transporting Ford automobiles overseas. The propelling units will consist of two sets of Sun-Doxford opposed piston solid-injection engines, each having 4 cylinders, 21½-in. bore, and a combined stroke of the opposing pistons of 85 in. These engines, when turning at 85 r.p.m., will develop 2,500 b.h.p.

There will also be installed two 225 h.p. Worthington-Diesel engines of the two-cycle solid-injection type, direct coupled to electric generators for supplying three-stage air compressors which will furnish compressed air for manœuvring the ship, and also for supplying the electrical auxiliary equipment on the ship.

Institution Notes.

Institution of Electrical Engineers.—MODEL FORM OF GENERAL CONDITIONS OF CONTRACT (EXPORT).—The Institution of Electrical Engineers has issued the two following additional sets of model conditions of contract for the supply of plant and materials (excluding cables) and the execution of work connected therewith:—B1. Conditions recommended for use in connection with export contracts (delivery f.o.b.); B2. Conditions recommended for use in connection with export contracts (including complete erection or supervision of erection). Copies of each may be obtained from the Secretary of the Institution, or from the publishers, Messrs. E. & F. N. Spon, Ltd., price 1s., post free.

Junior Institution of Engineers.—On Saturday, June 20th, members and friends of the Sheffield Branch of the Institution paid a visit to the works of the D.P. Battery Co., Ltd. Bakewell, where they saw the latest developments in the manufacture of storage batteries of all descriptions, from small portable cells suitable for wireless and other purposes, to submarine cells weighing nearly ½ ton each. Particular interest was taken in the casting of the special grids for Kathanode plates and also the machines for casting the multifarious types of plates developed by the company. On behalf of the visitors the president, Professor J. Husband, expressed their appreciation of what they had seen.

Our Personal Column.

(Electrical men are invited to enable us to keep readers of the "Electrical Review" posted concerning their movements).

At the close of the annual general meeting of the Electrical Contractors' Association (Inc.), held at 15, Savoy Street, W.C.2, on Thursday, June 18th, Mr. LEONARD G. TATE, the General Secretary, was presented with a silver salver and a cheque. Mr. Walter Riggs, the President, stated that Mr. Tate's connection with the Electrical Contractors' Association dated back to 1902, when he first became a member. He was appointed to the Council of the Association in 1904; he was elected first as hon. secretary of the London Branch, then as honorary general secretary in 1905. In 1918 he was appointed general secretary. Mr. Tate had, therefore, completed 21 years' active service with the Association, and he (Mr. Riggs) considered that a very opportune occasion to mark the esteem held for him by the whole of the membership throughout the country. The assiduity with which Mr. Tate had looked after the interests of electrical contractors since the formation of the Association was extremely gratifying, and his marked ability in all difficulties with which contractors were confronted, was appreciated by the whole of the membership. Mr. H. Willoughby-Ellis, as chairman of the London Branch of the Electrical Contractors' Association associated himself with this mark of esteem, and expressed the hope that Mr. Tate would for many years to come continue to be of such service to the whole industry. Further expressions of appreciation were voiced by Mr. W. A. Shaw (as representing the Manchester Branch, and as one of the early presidents of the Association), Mr. R. Robson (as secretary of the Northern Section and a member of the first Council of the Electrical Contractors' Association), Mr. H. J. Miles (as chairman of the Southern Section and on behalf of the Sussex Branch), Mr. E. M. Parsons (as chairman of the Northern Section), and Mr. T. E. Alger (the President of the Electrical Contractors' Association for the ensuing year), who spoke on behalf of the Western Section. Mr. W. R. Rawlings, the first President of the Association, referred to his long association with Mr. Tate, stating that he considered that the best thing the Association had ever done was to persuade Mr. Tate to relinquish his business in 1918, and so be able to devote the whole of his attention to the benefit of electrical contractors. The presentation salver, which was then handed to Mr. Tate, bore the following inscription:—"Presented to Leonard G. Tate, M.I.E.E., by the members of the Electrical Contractors' Association (Incorporated), as a token of esteem and mark of appreciation for the valuable services rendered by him on their behalf during the first 21 years. July, 1925." Mr. Tate, who was obviously touched by the many expressions of goodwill and appreciation expressed his thanks to everyone concerned, and stated that if what he had tried to do for the Association had been appreciated by the members, this was sufficient reward in itself.

At a recent meeting of the Lancaster Town Council, a recommendation of the Electricity Committee to increase the salary of the borough electrical engineer (Major G. C. MILNES) by £75 immediately and by a further £85 next year, was discussed. The chairman of the Committee said that the proposed additions were in accordance with the I.M.E.A. scale; the increase would be a fair recognition of Major Milnes's ability and the increased output at the new works. He considered that Major Milnes had saved the undertaking thousands of pounds. An amendment to refer the matter back to Committee was put forward on the ground that it was no time to increase salaries having regard to the prevalent unemployment. This amendment was carried by a small majority.

MR. G. P. SHALLCROSS, the Birkenhead electrical engineer, is due to retire on July 30th on reaching the age of 65 years, but the Electricity Committee recommends the retention of his services for a further 12 months.

Mr. GEORGE PATON, who for the past 2½ years has been in charge of the London radio sales department of the British Thomson-Houston Co., Ltd., has now taken up his new appointment as assistant manager to the Radio Department of the company at Coventry. Mr. A. E. MOODY has succeeded to his late position.

MR. T. P. PASK has been appointed chief electrical engineer of the South African Railways and Harbours Board.

The Blackburn Council has rejected a proposal to increase the salary of the manager of the tramways (Mr. J. H. COWELL) from £800 to £1,000 per year.

MR. ANDREW GARDNER, of Linlithgow, is to take charge of the interests of Callender's Cable and Construction Co., Ltd., in New York.

MR. S. F. BICKELL, A.M.I.E.E., has left the Prompton and Kensington Accessories Co., Ltd., to take up the post of manager and designer of the Heating and Cooking Department of the Cable Accessories Co., Ltd.

The Llandudno Urban District Council has approved a recommendation of the Electricity Committee to increase the salary of Mr. MORTON, the electrical engineer, from £413 to £500 per annum.

Mr. H. C. LAMB, M.I.E.E., M.I.Mech.E., who has been appointed chief engineer and manager of the Manchester Corporation electricity undertaking, to succeed Mr. S. L. PEARCE, who is now one of the Electricity Commissioners, is 47 years of age. His experience of the Manchester system extends over some 23 years, for he joined the staff of the department as an engineer-in-charge at the generating stations in 1902. He was appointed resident engineer at the Stuart Street generating station in 1913, and he has acted as deputy to Mr. Pearce during the last 6½ years, including, of course, the latter's period of absence in Australia. As our readers are aware, Mr. Lamb is at present chairman of the North-Western Centre of the Institution of Electrical Engineers. Glancing back at his pre-Manchester days we may note that he obtained his early training with Messrs. George Clarke, Ltd., marine engineers, of Sunderland, and with Messrs. Scott & Mountain, electrical engineers of Newcastle-on-Tyne. He received his technical education at the Rutherford College and the Durham College of Science. He served on the staffs of the Electric Supply Co. at Preston and the Wigan Electricity Department, before going to Manchester.

The recommendation of the Manchester Corporation Establishment Committee respecting Mr. Lamb's appointment reads as follows:—"That Mr. H. C. Lamb (now Deputy Chief Engineer at the remuneration of £1,330 per annum) be appointed Chief Engineer and Manager in succession to Mr. S. L. Pearce,

Lafayette [*Manchester.*

Mr. H. C. Lamb,

the new Chief of the Manchester Electricity Undertaking.

as and from August 1st, 1925, at a salary of £2,500 per annum, which includes all fees and emoluments for the completion of the Barton Power Station." It was also recommended:—"That Mr. H. A. Ratcliffe (now Superintending Electrical Engineer at the remuneration of £950 per annum) be appointed Deputy Chief Engineer at an inclusive salary of £1,300 per annum, rising to £1,500 per annum, as follows:—From August 1st, £1,300; from August 1st, 1926 £1,400; from August 1st, 1927, £1,500."

We reproduce herewith a portrait of Mr. THEODORE STRETTON, who has been elected president of the Association of Mining Electrical Engineers. Mr. Stretton, who was born in 1876, was educated at St. Edmund's College, London, the Regent Street Polytechnic, and Cardiff University College, subsequently serving an apprenticeship with Messrs. Brown, Lenox and Co., Pontypridd. He then became assistant engineer with Messrs. Robert Blackwell & Co., Ltd., afterwards going to Dublin as engineer-in-charge of the Ringsend power station.

H. J. Whitlock & Sons [*Cardiff.*

Mr. Theodore Stretton, M.I.E.E., M.I.Mech.E.

President of the Association of Mining Electrical Engineers.

Upon leaving Dublin he was appointed engineer in the South Wales district and superintended the carrying out of several of the earliest tramway and overhead transmission contracts in that area. In 1906 he entered into partnership with Mr. S. B. Haslam and is now joint managing director of Messrs. Haslam & Stretton Ltd., electrical and mechanical engineers. Mr. Stretton is a member of the Institutions of Electrical and Mechanical Engineers, the Iron and Steel Institute, and the South Wales Institute of Engineers. He has had a great deal to do with the standardisation of colliery apparatus, being a member of the B.E.S.A., and he was the principal patentee of the "Thor" miner's lamp.

The *Surrey Advertiser* reports that the Epsom Urban Council has given three months' notice to terminate his appointment to its electrical engineer, Mr. A. C. GILLING, and granted him leave of absence for the period in question. The assistant electrical engineer, Mr. H. J. EVANS, has also been given one month's notice, and granted one month's leave of absence. The post of electrical engineer has been advertised.

Wolverhampton Corporation Electricity Committee has appointed Mr. W. N. GORDON commercial secretary to the Electricity Department at a salary of £355 per annum, plus bonus.

The erection of the power station buildings in Hibernia Street, George Cape Province, has been commenced, and Mr. A. S. CHAMERS, of Alice, has been appointed resident electrical engineer.

Obituary.—MR. W. ARNOT.—The death took place on June 24th of Mr. William Arnot, one of the best-known electrical engineers in Glasgow. The first electrical engineer to be appointed by the Corporation, he took up his duties in 1890 and was responsible for the erection of the first municipal electrical installation in the city. On the completion of the Port Dundas and St. Andrew's Cross stations Mr. Arnot retired from the Corporation, and in 1898 set up in private business. He had been a member of the Institution of Electrical Engineers since 1891.

Wills.—The late Mr. JOHN SAMPSON (of Dick, Kerr & Co., Ltd.) left £75,412 gross and £66,567 net personalty.

The gross value of the estate of Mr. E. B. ELLICE-CLARKE (Edison Swan Electric Co., Ltd., and other companies) was £47,331, and the net personalty £46,614.

The late Sir W. M. ACWORTH left £26,960 gross and £19,478 net personalty.

New Companies Registered.

Electric Development Syndicate of Northern Ireland, Ltd. (N.I. 255).—Private company. Registered June 19th in Belfast. Capital, £100 in £1 shares. Objects: To promote or assist in promoting Bills in Parliament of Northern Ireland to grant permission for the supply of electrical energy for any purpose to any town, place, &c. The first directors are:—F. A. Heron, Maryfield, Holywood, D.L.; and A. S. Merrick, 32, Wellington Park, Belfast, solicitor. Solicitor: A. S. Merrick. Registered office: 7, Wellington Place, Belfast.

Horstmann, Ltd. (206,853).—Private company. Registered June 25th. Capital, £10,000 in £1 shares. Objects: To carry on the business of motor, electrical, mechanical and general engineers, carriers, transport agents, &c. The first directors are:—S. A. Horstmann, Onega Lodge, Upper Bristol Road, Bath; W. S. Butler, West Lodge, Englescombe Lane, Bath; J. W. Rooke, Westfield House, Upper Weston Road, Bath; E. H. Horstmann, Widcombe Crescent, Bath; and E. J. White, Beckford, Bathwick, Bath. Qualification, £500. Remuneration as fixed by the company. Solicitors: E. J. White & Co., 24, High Street, Bath.

Electro-plating (1925), Ltd. (206,821).—Private company. Registered June 24th. Capital, £2,500 in £1 shares. Objects: To acquire the business of electro-plating and lacquering in all its branches carried on by G. Morrison at Blackpool, and St. Annes, Lancs. The permanent directors are:—G. Morrison, 1, Mersey Road, Blackpool, electrical engineer; and E. W. Hough, 2, Harley Road, Blackpool, secretary. Qualification, £250. Solicitor: S. O. Taylor, 19, Birley Street, Blackpool. Registered office: 30, Birley Street, Blackpool.

Hulton & Hinchliffe, Ltd. (206,823).—Private company. Registered June 24th. Capital, £500 in £1 shares. Objects: To acquire the business of electrical and general engineers carried on by W. W. Hulton and H. Hinchliffe at Oldham as "Hulton & Hinchliffe." The permanent directors are:—W. W. Hulton, 83, Waterloo Street, Oldham, electrical engineer; and H. Hinchliffe, 42, Bottom o' th' Moor, Oldham, electrical engineer. Qualification: £100. Remuneration as fixed by the company. Secretary: H. Hinchliffe. Solicitor: R. O. Mellor, 7, Church Lane, Oldham.

Falconar, Cross & Co., Ltd. (206,875).—Private company. Registered June 26th. Capital, £7,000 in £1 shares (3,500 5 per cent. cumulative preference and 3,500 ordinary). The objects are: To adopt an agreement with O. L. Falconar and W. Cross, and to carry on the business of electrical engineers and contractors formerly carried on by them at Newcastle-upon-Tyne, and that of manufacturers of and dealers in wireless apparatus and appliances, motor cars, &c. The first directors are:—O. L. Falconar, 44, Sanderson Road, Jesmond, Newcastle-upon-Tyne, electrical engineer; W. Cross, 22, Gowan Terrace, Jesmond, Newcastle-upon-Tyne, electrical engineer. Qualification, £100. Remuneration as fixed by the company. Solicitors: Sutton, Cheshire & Thompson, 12, Moseley Street, Newcastle-upon-Tyne. Registered office: 7 and 9, Ridley Place, Newcastle-upon-Tyne.

Belgravia Electrical Co., Ltd. (206,694).—Private company. Registered June 18th. Capital, £2,000 in £1 shares. Objects: To carry on the business of engineering contractors, general engineers, mechanical, constructional, marine, and civil engineers, manufacturers of, and dealers in electrical, magnetic, or galvanic engines and motor engines of all kinds, and all parts, accessories and things requisite and capable of being used in connection with the above or in connection with electrical engineering, wireless telephony and telegraphy, electric lighting, heating, carpentry, &c. The first directors are:—H. S. Marquand, "Northwood," Woodcote Road, Leigh-on-Sea, electrical and marine engineer (permanent); H. C. Garland, 40, Crusoe Road, Mitcham, company secretary. Qualification, 10 ordinary shares. Remuneration as fixed by the company. Secretary: H. C. Garland. Solicitor: W. Scott, Jamaica Buildings, St. Michael's Alley, Cornhill, E.C.3. Registered office: Adams House, 23, Old Queen Street, Westminster, S.W.1.

Electricity (Hull), Ltd. (206,763).—Private company. Registered June 20th. Capital, £2,000 in £1 shares. Objects: To carry on the business of manufacturers of, contractors for and dealers in wires, lamps, fittings, accumulators, batteries, dynamos, motors, magnetos, indicators, bells, switches, controls, valves, telephonic and telegraphic instruments and apparatus, and wireless goods, appliances and accessories, electrical, mechanical, and general engineers, &c. The permanent directors are:—W. Hancock, 127, Alliance Avenue, Hull, fruit merchant (chairman); G. A. Allenby, 162, Chanterlands Avenue, Hull, electrician (managing director); C. W. Foster, 37, Wolfreton Road, Anlaby, near Hull, locomotive driver. Qualification, £50. Secretary: C. W. Foster. Solicitors: Middlemiss, Pearce and Miller, Hull.

Fada Radio, Ltd. (206,768).—Private company. Registered June 20th. Capital, £500 in £1 shares. Objects: To acquire the trade mark "Fada," No. 438,626, and to carry on the business of manufacturers, exporters, importers, and distributors of, and dealers in radio, electrical, and scientific apparatus, installations, accessories, &c. The subscribers (each with one share) are:—W. J. Roche, 451, East 22nd Street, Brooklyn, New York, U.S.A., clerk; E. S. Daniells, "Waconsta," The Bishop's Avenue, N.2, merchant. The first directors are:—F. A. D'Andrea (permanent governing director and chairman), address not stated; W. J. Roche; and E. S. Daniells. Qualification, £1. Remuneration (except managing directors, if any), as fixed by the company. Solicitors: R. C. Partlett & Co., 44, Bedford Row, W.C.1.

Pearl Electrical Co., Ltd. (206,808).—Private company. Registered June 22nd. Capital, £500 in £1 shares. Objects: To carry on the business of manufacturers of, and dealers in electrical goods and accessories, &c. The first directors are:—G. W. Cavell, 168, Cambridge Street, Belgravia, S.W.1, electrical engineer; J. A. Hansen, 36, Tennyson Street, Battersea, S.W.11, foreign correspondent. Solicitors: Lawson & Lawson, 181, Queen Victoria Street, E.C.4. Registered office: Edinburgh Mansions (Howick Place), Victoria Street, S.W.1.

A. F. Yarnold, Ltd. (206,867).—Private company. Registered June 26th. Capital, £2,000 in £1 shares (500 7 per cent. cumulative preference and 1,500 ordinary). Objects: To carry on the business of electrical engineers, electrical constructors, contractors, dealers in, and agents for electrical plant, supplies, lamps and bells, telephone contractors, &c. The directors are:—A. F. Yarnold, 132, Gleneagle Road, Streatham; B. W. Oakley, 33, Conyers Road, Streatham; F. H. Campbell, 42, Hillcourt Road, East Dulwich; C. J. Bennett Ashby, 29, Riggindale Road, Streatham, S.W. Qualification, £10. Remuneration, £10 each per annum. Secretary: F. H. Campbell. Solicitor: G. A. Martin, 6, Guildhall Chambers, 31, Basinghall Street, E.C. Registered office: 19, Shrubbery Road, Streatham, S.W.

Wireless and Radio Trades Guardian Association, Ltd. (206,919).—Registered June 27th as a company limited by guarantee and not having a share capital with 500 members each liable for 5s. in the event of winding up. The income and property of the Association shall be applied solely towards the promotion of its objects, and no portion shall be paid or transferred by way of dividend, bonus, or otherwise by way of profit to the members, provided that the company shall not be prevented from paying remuneration to any officer or servant of the company or to any member or other person in return for any services rendered. The objects are: To provide an organisation for uniting the signatories and any other persons, firms, associations, or companies engaged in or connected with wireless telephony or telegraphy, including television, or any business allied thereto, to disseminate legal and other information, to protect members against persons unworthy of credit, to collect debts for members, &c. The subscribers are:—C. Latham, 15, Eastcheap, E.C., certified accountant; H. Hodson, Lytham Villa, Park Road, E.12, clerk; A. Middleditch, 20, Copland Road, Wembley, clerk; H. Turner, 9, Oakmead Road, S.W.12, clerk; A. V. Hunter, 6, The Shrubberies, S. Woodford, clerk; J. H. Long, 47, Felixstowe Road, Lower Edmonton, N., clerk; F. S. Gardner, 69, Tachbrook Street, S.W.1, clerk. The management is vested in an executive committee, the first members of which are not named. C. Latham, F.L.A.A., is secretary and accountant to the company.

Norman Radio, Ltd. (206,947).—Private company. Registered June 29th. Capital, £1,000 in £1 shares. Objects: To carry on the business of makers and workers of, and dealers in private and other telephones and telegraphs of all kinds, electricians, &c. The directors are:—J. Portwine, "Three Gates," College Road, Dulwich, S.E.21 (director of Solidite Manufacturing Co., Ltd.); C. W. Rooke, 17, Rusthall Avenue, Bedford Park, W.4, chartered accountant. Secretary: H. W. Bramley, "Shalimar," Central Avenue, Rochford, Essex. Registered office: 133a, Upper Street, Islington, N.1.

X.L.O. Co., Ltd. (206,906).—Private company. Registered June 27th. Capital, £1,000 in £1 shares. Objects: To acquire the business of the X.L.O. Co. as electrical engineers carried on at 48, Strand, W.C., and 122, Pentonville Road, N.1, and to carry on the business of wireless contractors, manufacturers, importers and exporters, &c. The subscribers (each with one share) are:—O. R. C. Sherwood, 122, Pentonville Road, N.1, electrical engineer; S. B. White, 122, Pentonville Road, N.1, engineer. The first directors are not named. Solicitors: Cochrane & Cripwell, Balfour House, 119, Finsbury Pavement, E.C. Registered office: 122, Pentonville Road, N.1.

Official Returns of Electrical Companies.

Boston Wireless and Electrical Co., Ltd. — Debenture dated June 12th, 1925, to secure £500 charged on the company's property, present and future, including uncalled capital. Holder: Mrs. G. L. Bostandji, Coniston Villa, Burnage Lane, Levenshulme, Manchester.

General Radio Co., Ltd.—Particulars filed of £3,000 debentures authorised May 28th, 1925, charged on the company's property, including uncalled capital, the amount of the present issue being £1,500.

Will Smith, Ltd. — Particulars filed of £400 debentures authorised May 25th, 1925, charged on the company's undertaking and property, present and future, including unpaid capital, the amount of the present issue being £200.

British Arc Welding Company (Bristol Channel), Ltd.—Mortgage on freehold land, hereditaments and premises at Hope Street, Cardiff, dated June 8th, 1924, to secure all moneys due or to become due from the company to the Midland Bank, Ltd.

Charles Coton & Co., Ltd.—Satisfaction in full on June 6th, 1925, of mortgage dated October 21st, 1906, securing £1,600.

Receptors, Ltd.—Particulars filed of £20,000 debentures authorised May 14th, 1925, charged on the company's property, present and future, including uncalled capital, the amount of the present issue being £500.

Grierson Ledway Co., Ltd. — Mortgage debenture dated June 13th, 1925, to secure £3,000 charged on the company's property, present and future, including uncalled capital. Holder: R. Hannah, 115, Abbey Road, Barrow-in-Furness.

Acme Electric Lamp Co., Ltd.—First debenture and second debenture, both dated May 28th, 1925, to secure £1,400 and £1,151 respectively, charged on the company's undertaking and property, present and future. Holders: Mrs. M. Tyler, 47, Rudloe Road, Balham; and H. S. Tyler, 2 and 3, Station Road, Balham.

L. Jacobs (London), Ltd.—Debenture dated May 22nd, 1925, to secure £2,500 and moneys due or to become due under guarantees given at the request of the company, charged on the company's undertaking and property, present and future, including uncalled capital. Holder: W. Rose, "Stonington," Station Road, Hendon, N.W.

Rheostatic Co., Ltd.—Mortgage dated May 29th, 1925, constituting a specific charge on 31, Mackenzie Street, Slough, and all other, if any, hereditaments and premises comprised in an indenture of the same date and a floating charge on the company's undertaking and property, present and future, including uncalled capital, to secure all moneys due or to become due from the company to the District Bank, Ltd.

Pope's Electric Lamp Co., Ltd.—Satisfaction in full on June 16th, 1919, of Land Registry Charge dated April 16th, 1909, securing all moneys due or to become due from the company to the London City and Midland Bank, Ltd. (Notice filed June 10th, 1925.)

City Notes.

Reports and Meetings of Electrical Companies; Dividend Results, &c.

Globe Telegraph & Trust Co., Ltd.

The annual meeting was held on June 23rd, Sir John Denison-Pender, C.B.E., presiding. In presenting the report and accounts (see ELEC. REV., June 19th, p. 989), the chairman said that the results were again satisfactory, the net income having increased by £5,098, in spite of lower receipts from the American holdings due to the rise in the value of the pound sterling. Their income from the Submarine Cables Trust was diminishing owing to the drawing of the bonds but the proceeds were being reinvested. The amount thus received during 1924 had been invested in the Commercial Cable Company's 4 per cent. debenture stock, which gave a lower return but was a sound investment. The investment in the French Telegraph Company had been written off, that company having gone into liquidation with liabilities exceeding the assets. They had again been able to transfer a considerable sum to reserve, making it £105,000. The invested reserves of the cable companies comprising their holding amounted to a large figure and the companies were therefore able to provide any new cables which were required to meet developments. The value of the company's holdings at May 31st last showed an appreciation of £2,167,881 over cost.

Aron Electricity Meter, Ltd.

Mr. Harry Kahn presided at the annual meeting on June 23rd, and in presenting the report and accounts (*vide* ELEC. REV., June 19th p. 989), said that the value of goodwill and patents, including shares and interests in subsidiary companies, was given as £50,106 in the balance sheet, but the value of shares and interests alone was greater than this figure. The sum carried forward was subject to additional income tax, regarding which the company had a dispute with the authorities with reference to the incidence of taxation during the war. Any amount paid in excess of the reserves would have to come out of the current year's profits; shareholders should, therefore, not be too sanguine about a large ordinary dividend next year. Both the London and Vienna branches showed an increased turnover, especially the latter, but in view of the difficulties with which Austria had to contend the maintenance of the increase was problematical. They had had to increase their London accommodation and had purchased the lease of the present factory and two adjacent buildings.

Delhi Electric Tramways and Lighting Co., Ltd.

The accounts for the past year record gross receipts of £24,935 for the tramway undertaking and £68,894 for the electricity supply undertaking, representing increases of about 4½ and 9¾ per cent. respectively. The combined undertakings show a net revenue of £41,429, as against £36,840 in 1923. After charging debenture interest and London expenses, there remains a profit of £38,410, to which is added £1,304 brought forward, making £39,714. Depreciation absorbs £16,000; the reserve for taxation £4,000; and the renewals reserve £5,000. It is proposed to pay a dividend of 10 per cent. upon the preferred and participating shares, and one of 9.448 per cent. on the ordinary shares, leaving £12,740 to be carried forward. Additions to plant costing £17,743 were made during the year; this was chiefly Diesel plant, switchgear and mains. Further extensions of sub-stations and mains are in progress. It is hoped to complete an agreement during the current year for a bulk supply from the Government generating station. The meeting was held on Tuesday last.

Waygood-Otis, Ltd.

The company's annual meeting was held on June 26th, Mr. H. C. Walker (chairman) presiding. Mr. Walker said that the development of the Falmouth factory was still being proceeded with, and economies in manufacture would result. Developments in Australia and New Zealand had increased the item "Investments and loans." The lift contracts secured during the year were greater in number and value than those of the preceding year, and an increasing number of orders were coming in from overseas. The "Micro-drive" self-levelling lift continued to gain favour, and the sales of that type had considerably increased. The exchange by shareholders of the company's ordinary shares for common stock of the Otis Elevator Co. had resulted in a closer union of the two concerns.

French Companies.

The *Constructions Electriques de France*, after setting aside 3,200,000 fr. for depreciation in 1924, has decided to carry forward a balance of 1,534,000.

The *Compagnie des Lampes*, which is a subsidiary of the Compagnie Générale d'Electricité and the Société Thomson-Houston reports net profits of 11,576,000 fr. for 1924, as against 9,979,000 fr. in the previous year. The dividend is at the rate of 8 per cent., as in 1923.

The directors of the *Forges et Ateliers de Constructions Electriques de Jeumont* state that despite the disturbed economic situation in 1924, the order books were well supplied. Owing, however, to the depreciation of the franc and the increase in the cost of raw materials, the directors had judged it expedient to employ most of the net profits, which amounted to 5,996,000 fr., in augmenting the floating capital necessary for working so as to avoid having recourse to an increase of the capital, the rate of dividend consequently being reduced to 15 fr. per share for 1924.

The *Constructions Electriques de France* records gross profits amounting to 5,789,000 fr. After placing 3,200,000 fr. to depreciation, the balauce has been carried forward.

The *Compagnie d'Entreprises Electro-Mécaniques* reports an increased turnover in 1924, the gross profits and balance forward amounting to 127,000 fr. After applying 115,000 fr. to depreciation, the balance has been carried forward.

The *Compagnie L'Electro-Entreprise* reports gross profits of 1,441,000 fr. for 1924, and after making provision for depreciation, &c., the net sum available amounts to 925,000 fr. The rate of dividend is increased from 6 to 7 per cent.

A liquidator has been appointed by the *Société Industrielle d'Appareillage et de Constructions Electriques* (*Anciennement Société d'Appareillage Téléphonique Industriel et Sonneries*), of Paris.

The *Société Electro-Métallurgique de Dives* is increasing its capital from 40 to 45 million francs with the object of taking over the works and business of the Société Hydro-Electrique et Métallurgique du Palais.

Swiss Companies.

The directors of *Brown, Boveri and Company* have resolved to pay a dividend at the rate of 6 per cent. for 1924, and to place 500,000 fr. to reserve.

The *Alioth Electricity Company*, of Basle, which is associated with the above company, reports net profits of 352,000 fr. for 1924, and a dividend at the rate of 5 per cent. as in 1923.

County of London Electric Supply Co., Ltd.—At an extraordinary meeting held on June 29th, Sir Harry Renwick, K.B.E., moved resolutions providing for the increasing of the company's capital to £7,000,000 by the issue of 2,000,000 preference and 2,000,000 ordinary shares of £1 each. He stated that the main object of the issue was to provide for the repayment of 5½ per cent. one-year notes (£1,500,000), which matured in September. The holders of the notes would be given an opportunity of exchanging them for new preference shares. Apart from the Barking undertaking, the company held controlling interests in certain progressive undertakings south of the Thames which were now ripe for profitable development. The resolutions were adopted.

Stock Exchange Notices.—The undermentioned securities have been ordered to be officially quoted:—

Clyde Valley Electrical Power Co.—600,000 ordinary shares of £1 each, 10s. paid, Nos. 600,001 to 1,200,000.

Dealings in the following have been specially allowed by the Committee under Rule 159:—

Calcutta Electric Supply Corporation.—7,193 ordinary shares of £1 each, fully paid, Nos. 925,001 to 932,193.

Application has been made to the Committee to allow the following to be officially quoted:—

Shropshire, Worcestershire, and Staffordshire Electric Power Co.—150,000 6 per cent. cumulative preference shares of £1 each, fully paid, Nos. 450,001 to 600,000.

United River Plate Telephone Co.—112,000 ordinary shares of £5 each, fully paid, Nos. 648,001 to 760,000.

Kalgoorlie Electric Power & Lighting Corporation, Ltd.—The accounts for the past year show a profit of £18,504, as compared with £12,351 in 1923. After providing for depreciation there remains a balance, including the amount brought forward, of £7,359. This allows of the payment of 6 per cent., less tax, on the income debenture stock. The meeting was to be held yesterday (Thursday).

International Light and Power Co.—The following dividends are announced:—3 per cent. (less British tax) on $1,275,000 preference shares for the half-year ended June 30th; and at the rate of 6 per cent. (less tax) on $174,400 additional preference shares in respect of the period from the date of allotment (April 9th) to June 30th.

Eastern Telegraph Co., Ltd.—The directors announce a dividend at the rate of 3½ per cent. per annum less tax on the preference stock for the quarter ended June 30th, 1925, and a first quarterly interim dividend of 2½ per cent. on the ordinary stock, free of tax, in respect of the year ending December 31st next.

New General Traction Co., Ltd.—The accounts for the year ended at March last show a revenue of £12,700 and a net profit of £9,887—an increase of £1,087. The addition of £2,945 brought forward makes available £12,832, out of which the payment of a dividend of 4½ per cent. is recommended, leaving £3,695 to be carried forward.

Seaton and District Electric Light Co., Ltd.—It was stated at the annual meeting on June 20th that the present scale of charges, which worked out at 8¼d. per kWh, made it impossible for a dividend to be declared, and that new charges of 8d. and 10d. per kWh were to be imposed.

British Columbia Electric Railway Co., Ltd.—The dividend for the half-year ended June 30th has been declared on the 5 per cent. cumulative perpetual preference stock.

Midland Counties Electric Supply Co., Ltd.—The recent issue of 250,000 each of preference and ordinary shares has been fully subscribed by the shareholders.

Eastern Extension, Australasia and China Telegraph Co., Ltd.—The directors have declared an interim dividend for the three months ended March 31st last of 5s. per share, free of tax.

Aster Engineering Co. (1913), Ltd.—The directors report a further loss of £13,032 during the past year, making a total of £40,594.

Marconi's Wireless Telegraph Co., Ltd.—A dividend at the rate of 7 per cent. per annum has been declared in respect of the half-year ended June 30th.

Ferguson, Pailin, Ltd.—An interim dividend of 3½ per cent. actual has been declared on the ordinary shares.

St. James' & Pall Mall Electric Light Co., Ltd.—The following interim dividends are payable on August 1st:—At the rate of 3s. 6d. on the preference shares, and 5s. on the ordinary shares.

Stocks and Shares.

MONDAY EVENING.

STOCK Exchange business comes by fits and starts. Some of the markets are tolerably active. In others, there is next to nothing doing. The monetary stringency should be eased by the turn of the half-year. The chance of a rise in the Bank Rate is held, once more, to be negligible for the time being,

but the apprehension is liable to revival at any moment, and in consequence, gilt-edged stocks go cautiously, having appreciably recovered, however, from their recent lowest prices. There has been too much outpouring of new issues for these stocks to have yet become properly assimilated by the investor. For some time to come, gilt-edged securities are liable to be affected by the financial indigestion caused by the number of new capital appeals that poured out during May and June.

The County of London Electric Supply Company is likely to experience no difficulty in securing subscription to the two million pounds 6 per cent. new preference shares which it is about to offer. The company held a meeting to-day, Monday, at which sanction was duly given to the raising of the capital from three million pounds to seven million pounds, half to be in preference, half in ordinary. Of the former the shares are to be issued immediately at 20s. 6d. No doubt the two million ordinary shares will be held in reserve until the County Company's Bill has been passed by Parliament, and the capital account can be re-arranged on the new basis rendered necessary by the extension of the company's lease of life under the Act lately passed. The advent of the new preference capital caused a slight dulness in the prices of the ordinary and preference shares, and the former have eased off to 53s. 9d., which is 2s. down on the week. The preference also are a trifle easier at 22s. 6d. These carry more dividend, of course, than the newcomers which are on the point of making their appearance.

City of Londons reacted to 47s., the preference being a shade lower at 23s. Notting Hill preference, quoted ex dividend last Thursday, recovered their 6s. deduction. Clyde Valleys are weaker at 31s. The list is steady as a whole, apart from these changes.

Eastern cable stocks continue dull, in spite of their recent declines. Prices do not seem to have reached those levels at which investment admits temptation. The Eastern company has declared its usual quarterly dividend of 2½ per cent. free of tax for the first part of 1925. Both the Globe shares are ex dividend. Westerns are 5s. down at 16⅛. Cuba Submarines fell back to 6¾. United River Plates have hardened to 7.

In the wireless group, Marconis have gone back 3/16 to 27s. 6d., there being no life in the market, and some of the recent applicants for the new shares being apparently desirous of selling them. The 7 p.c. participating preference at 27s. 6d. are ex 8½d. dividend. Canadian Marconis at 4s. 6d. show a trifling gain.

Railway stocks have been pursuing a very uneven track. From their recent despondency, they enjoyed a brisk recovery, prices rising several points for a few days. The improvement, however, has not been held, and public confidence is coy of buying stocks in companies that are so liable to disturbance both from financial causes and also from labour troubles. Underground Electric Railways £10 shares fell to 50s. and the shilling shares to 7s. 6d. Metropolitan Consolidated declined to 70½. Central London ordinary shed a point. London United Tramway debentures are 45½ ex dividend. British Electric Traction ordinary at 112 is down a nominal 7 points, but most of this is accounted for by deduction of the dividend. The 7 per cent. preference at 104 is also x.d.

Midland Counties Electric keep their price at 23s. 9d. It is announced that the company's recent issue of 250,000 preference and 250,000 ordinary shares, made to the shareholders of the company, has been fully subscribed. Dealings started a few days ago in the 6 per cent. preference shares of the Shropshire, Worcestershire and Staffordshire Electric Power Company. These can be bought at 22s. with dividends in March and September, the yield at the present price being nearly 5½ per cent. on the money. The amount required for the dividend service is £12,500 per annum, which was covered 7½ times over by the profits shown in last year's accounts. South Wales Power 6½ per cent. preference at a guinea yield £6 3s. 6d. ex the dividend payable on July 1st. Urban 6 per cent. preference can be bought at 19s. 3d., and there are a few thousand Westminster Electric 4½ per cent. preference obtainable at 18s. ex dividend, the return in this case being 5 per cent. on the money. These last-named can be regarded as a gilt-edged investment, so ample is the cover for the service of the dividend.

The manufacturing group is a little duller. A fall occurred in General Electrics to 25s., on scattered sales by a few of the people who bought the shares in advance of the dividend announcement, and who sold when the figures came out. Siemens went back to 25s. 9d., a fall of 6d. per share, the present yield on the money being small when matched against that offered by General Electrics and some of the others in this group. British Aluminium weakened to 30s. Callenders new shares are quoted at 6s. 6d. premium, and the senior issue remains at 58s. 9d. ex rights. Babcock & Wilcox at 2 7/16 display a loss of 2s. 6d., the market in iron and steel shares as a whole being what the Stock Exchange terms "tender," although there has been a little support from the North during the past few days.

Rubber shares keep up; the daily volume of trade transacted in this market is still considerable. The price of the produce has further advanced to 3s. 4½d. per lb. for cash. People are selling other Industrials in order to pay for rubber shares, and this explains part of the dulness that has crept into prices of shares in other companies whose prospects are held to lie more in the future than in the present.

Installation Policy: Its Importance to the Electricity Supply Industry.

By L. L. ROBINSON, M.Inst.C.E., M.I.E.E., M.I.Mech.E.

(*Abstract.*)

(*Concluded from page* 1014, Vol. XCVI.)

Referring to unemployment in a speech at Leeds, Mr. J. R. Clynes, M.P., said: "Under any conditions it was true to say that workmen who limited output were doing themselves the greatest harm. The author hesitates to say anything that might be construed as hostile to labour. Nevertheless, it is necessary to ask whether the workers in the electricity industry are doing their best towards popularising the use of electricity? Whether they are not on a mistaken hypothesis trying too much to advance themselves not with, but at the expense of the rest of the community? Labour costs in wiring and installation work are still abnormally high, higher than in proportion to the increase of wages since pre-war days. Cheap installations will, at the moment, increase the use of electricity more speedily than any other thing we can do for the public, because it is generally admitted that first cost of installation work is the great obstacle to greater progress. Therefore, by working more efficiently, the installation operatives will not keep other men unemployed but will actually increase employment throughout the country in factories making every type of current consuming device, cables, machinery, &c., right away to the feed pumps. At the present time no discussion upon wiring and installations could be complete without a reference to the 8th Edition of the I.E.E. Wiring Rules. Are regulations necessary? The author's opinion is that if only qualified people were allowed to carry out wiring and installation work, regulations would be unnecessary, and that all regulations are defeated unless steps are taken to ensure good workmanship.

It would be far cheaper to allow none other than properly qualified people to have anything to do with electrical installations The insurance interests are at the bottom of all the tightening up of installation and wiring rules; but do they ever refuse a risk because rules have not been complied with? And is it not a fact that even "curbstoners'" installations are so "safe" that it does not pay an insurance company to send an inspector to survey each risk? How much will an insurance company reduce a premium if a job is carried out under the 8th Edition Regulations instead of under the 7th Edition, or neither? The author is of opinion that it is unwise of the I.E.E. to call the present edition "regulations." They are not enforceable as such by any but one or two undertakings who have special powers to make regulations, and these may foolishly adopt the I.E.E. brand. At the most they are recommendations or draft regulations. As they are not enforceable they are little better than pious opinions and will become a dead letter like the ridiculous speed limits of automobile legislation. Commerce is seldom able to rely for trade upon selling only the absolute and ideally perfect.

It seems to the author quite superfluous to worry so much about Safety First. Even Mr. C. S. Russell, the well-known fire insurance expert, has only known of three cases where fires had an electrical origin in 30 years' experience. The author expects that he attributes the immunity to the power of the old Phœnix Rules, but as these are seldom observed it must really be due to the inherent safety of electricity. It is to be feared that the framers of electricity regulations always have in their mind great factories or public buildings where the responsibility of electricity is so much greater than in houses, small workshops and the usual run of business premises which do, and will increasingly, take the bulk of our output. The author has been asked to quote chapter and verse as to what particular items he objects to. He objects to nearly all of them. Each rule taken individually is almost perfect from the hyper-super-safety point of view, although absolute perfection can never be attained and fatalities may take place even if these costly rules are observed. One important objection is the unconscionable size of flexes imposed upon us, with all the resultant expense and clumsiness of bigger fittings. The new "medium insulation" may only be used for wiring pendants and fittings, and "high grade" must be used for all portable apparatus. This will mean altering the design of most portable fittings, particularly those with knuckle joints which as a rule will take none but the thinnest flex. Twin twisted flex is doomed—it may only be used for fixed wiring, fixed fittings and portable lamp standards. For all other purposes flex must be circular, braided or made up oval. Twin twisted flex is no longer permitted for electric fires or even for irons, toasters, curling tongs, shaving pots kettles, fans, &c. The most drastic and expensive change is the new current density ruling for flex, which is reduced to about half the old value. A six-pound 600-watt iron usually supplied with a light flex and adapter to fit any lampholder must, under the new rules, have a 23/36 or 40/36 flex at 200 volts and a 70/36 at 100 volts. For electric fires the increase in size is even more awful. A 2-kW fire at 100 volts will have to be fitted with a 296/.010-in. or 60/.018-in. flex and at 200 volts 110/.0076-in. As these flexes will have to be circular or oval braided, this increases the diameter still further as compared with present practice, which, in the author's experience, has not been unsatisfactory, and many manufacturers of fires will have to increase the diameters of the bushes through which the flex is led. The cost will vary from 3s. 6d. to 10s. per fire—the author has obtained samples which compare the flexes of present practice with the freaks "regulated" by the I.E.E. Look at the flexes for a 2-kW and 3-kW 100-volt fire! This *reductio ad absurdum* is not the author's—it is that of the Committee who framed the rules. And it is partly due to the earthing regulations which are, in the author's opinion, prohibitive. Is the electrical industry seriously going to advise the public that every coffee urn, every flat iron, and every toaster must be earthed? With regard to this requirement concerning earthing —earthing leads must be of high conductivity copper tinned or otherwise protected from corrosion, and while protected against mechanical injury must be easily accessible. One little undertaking the author knows of sends inspectors round to scrape earth wires to see if they are tinned, and if not is satisfied with daubing them over "where accessible" with a coat of paint.

Another very important clause provides that lamp adaptors shall not be used as plug connectors for appliances taking more than two amperes. Even if the flex rules and earthing rules do not kill the plug adaptor for irons, bowl fires, toasters, soldering irons, &c., this rule definitely settles the matter. Surely the convenience, an enormously important point in connection with two-part tariffs, is worth the small risk which is immeasurably less than that attached to similar gas-heated apparatus. This suppression of the handy little lamp adaptor is a most serious move against the popularising of domestic electrical appliances. These adaptors have been the secret of success on the Continent and in America. The author doubts whether table apparatus would ever have become so widespread in France, Belgium and Germany without them. And we are asked to abolish them. Why? The Electrical Development Association set up a small Committee to give consideration to the 8th Edition of the I.E.E. Wiring Rules, owing to the large number of complaints which had been received from its members, pressing for action in view of the great influence of any wiring regulations on electrical development. The Sub-Committee consisted of a few members of the E.D.A. Council, who could be regarded as generally representative of the four leading electrical supply interests, and in addition three members associated respectively with manufacturers, accessory manufacturers and electrical contractors. In making its specific observations this Committee prefaced its remarks by reminding the Institution that so far no powers existed to make enforceable regulations with the exception of a few supply undertakings which had acquired such powers through special Acts. The Sub-Committee suggested that after the recommendations had been altered or modified they might be submitted for re-drafting by an expert, not necessarily electrical, who would be able perhaps to simplify the wording and remove from the rules those objectionable characteristics which were leading to varied interpretation by different persons.

It was asked that the recommendations should be greatly reduced in bulk and that vague or "specification" matter should be excluded or dealt with separately; and that every attempt should be made to put in a minimum of definite rules, arranged in proper sequence and to be easily read and understood by anyone, down to the wireman's mate.

The Institution was reminded that the rules appeared to have been compiled under the influence of persons who had no interest in anything but complete safety and certainly did not appear to have regarded the value of the wider electrical development or the fact that every electrical appliance replaces some other method intrinsically more dangerous. The author doubts very much whether the most efficient way in which a supply undertaking should run its sales and service department or the best means the industry can find to ensure efficient installation work, have been discovered yet. This paper has not been written with the idea of laying down the law on the subject, but rather is intended to ventilate some of the difficulties in the hope that the discussion may lead to further progress.

Discussion.

Mr. F. W. PURSE (West Ham) said that the author had used the word "curb-stoner" with regard to certain contractors, but he could not help feeling that the paper itself was a "curb-stoner." It was one per cent. grain and 99 per cent. chaff. Whilst the author had said that he did not wish to be understood as condemning wiring contractors, yet he seemed to be doing so all through the paper for he repeatedly called them "curb-stoners" and little-minded men. Again, he said that municipal authorities must have full wiring powers and that wiring contractors had grown up as a separate part of the business. Surely all this indicated that the author was condemning wir-

ing contractors. Then it was stated that the primary object of the contractor was to make a profit. Did not Mr. Robinson wish to make a profit? Surely the answer to Mr. Robinson's own criticisms of the contractor was the I.E.E. Wiring Rules, and yet he condemned the wiring rules also. The object of the Institution wiring rules was to improve the standard of work of which Mr. Robinson complained. On the wiring rules he would have something to say later. He would remind Mr. Robinson also that contractors were represented on the Wiring-Rules Committee. The paper, too, contained many contradictions, such, for instance, as saying that the municipal electric supply authorities should work through contractors and then asking for full wiring powers for the municipalities. Then Mr. Robinson was quite wrong in saying that the average cost of wiring an installation was £25 per kW installed. It all depended upon the basis. If one took 40-W points, as Mr. Robinson did, it might be £25, but if one took 200-W points it would be £2. It was possible, of course, to work the figure up to £100, and it was a pity that in an engineering paper the figure of £25 should have been put forward. (Mr. Purse was proceeding to deal with the Institution wiring rules, but the President could not allow him any more time.)

Mr. S. E. FEDDEN (Sheffield) expressed regret that the opener of the discussion had not dealt with it in a broad way but had rather made it a personal attack on Mr. Robinson. After all, these meetings were held to endeavour to find the best way of securing the greatest good for the undertakings, consumers and ratepayers, and the really important point was whether full wiring powers should be granted to municipalities. He had full wiring powers in Sheffield, with a few restrictions, and his view was that if all municipal undertakings had full wiring powers, the supply industry could be developed in a manner not otherwise possible; moreover, the possession of such powers by the undertakings would benefit the contractors because the more energy that was sold the more wiring and installation work would have to be carried out. In Sheffield there were hundreds of contractors who were busy and doing an enormous amount of work and his own idea was that the Association should pass a resolution urging the Government to pass legislation which would give full wiring powers to the municipal electric supply authorities. Why should the gas and electric supply companies have these powers and the municipal electric supply authorities be placed at the disadvantage of not having them? Dealing with the paper, Mr. Fedden expressed the view that they must not expect to make the domestic development work pay at the very start, the profit would come all right later; that was where co-operation between the contractors and the supply authorities would come in. The supply authorities made a good profit on the sale of energy and therefore the installation work should be let out to the contractors on a schedule of prices, because the contractors could not become financially interested in hiring and similar schemes. It was one of the duties of the supply authorities to give service to the consumer and for that purpose he kept a business-getting staff which also dealt with maintenance and repairs, and an emergency staff which would carry out repairs at any time to either factory or domestic installations. During the war the turnover of the department was something like £90,000 per annum although it was not so large now, but a very large amount of business was done with satisfaction to the consumers. In order to introduce electricity into the smaller homes, a rental scheme of wiring was started last year but that did not prove a success. In February of this year he started a slot meter system under which the wiring and fittings were fixed free—the maximum number of lights for each house being fixed at five 40-W gas-filled lamps—and the meter set to give three hours' burning of one lamp for one penny. From February 1st to June 3rd, there had been 1,501 applications and, as the result of experiments, he was convinced that the cheapest and safest form of wiring was wood casing. In this way, the cost of the installation would be paid back in ten years. Applications were coming in at the rate of 100 per week under this scheme.

Miss PARTRIDGE (Exeter), speaking as a contractor, said that too much time was taken up by the contractor in teaching people what they ought to know as to the uses of electricity. If that education of the public was carried out by other means, there would be a more rapid development.

Mr. W. F. T. PINKNEY (Newcastle-on-Tyne Electric Supply Co.) regretted that Mr. Purse did not deal with the wiring rules first because he was looking for some convincing argument in their favour. Personally he did not see any reason for tightening up the 7th Edition and the only argument he had heard so far was that in Ontario the wiring regulations were very much more stringent. Whilst he agreed that the contractors were a weakness in the electric supply business he thought the fault and the remedy lay with the industry itself. The Electrical Contractors' Association was an excellent organisation, but it was weak in numbers and did not have within its membership anything like half the contractors in the country. It was up to the industry to help the contractors strengthen their Association. The "curb-stoners" had been brought into being not through any fault of the Contractors' Association, but because other sections of the industry would trade with anybody who called himself a contractor. Thus it was that we had men without capital and vision and everything should be done to eliminate this type from the industry; manufacturers should refuse to supply this class of man. He himself represented a company which, of course, had full trading powers and he had endeavoured not to start a wiring department of his own. Various methods had been tried of dealing through contractors, and as a result he was now working through a small section of selected contractors and the arrangement worked very smoothly. He was not interested in the question of municipal trading, but as there had been a good deal of opposition to it from contractors all he would say was that whoever supplied the electricity, the contractors should see to it that a vigorous policy was adopted by the supply authority because in that way, as Mr. Fedden had stated, there would be more and more work for the contractors. As an example of policy which might well be adopted in this country, he mentioned that in one large city in the United States the supply authority had put in over 80,000 trial installations in one year on the understanding that they would be taken out if they were not satisfactory, but none was ever taken out. In that city there were 2,300 contractors, all of whom were flourishing.

Mr. WALTER RIGGS (President, E.C.A.) said the general trend of the paper—not to put too fine a point on it—was that whilst contractors were thoroughly bad—with a few exceptions—supply undertakings were thoroughly good. During the past 25 years, tens of thousands of pounds and tens of thousands of man-hours of human effort had been wasted and actually thrown away as far as electrical progress was concerned, as a direct consequence of internal discord and strife within the industry itself. To-day this destructive effort had been almost entirely replaced by constructive work for the common good, and he deprecated any action which would throw us back into the confusion and bitterness of the past. The Electrical Contractors' Association claimed a great deal of credit for the very much improved position of things to-day, and its activities were meeting every day with increased encouragement and success; he gladly acknowledged the ever-growing good-will and support which was being received from manufacturers and others in the industry. A large number of central station engineers had recognised the folly of past discord and had settled down to a process of businesslike, co-operative development carried on in an atmosphere of local electrical peace and stability. To those who were making unsparing efforts on behalf of electrical unity and concord, such a paper as Mr. Robinson's came as a patience-trying ordeal of no small magnitude. Figures had been prepared which showed that those municipal electric supply undertakings which worked through contractors without any trading powers at all had made the greatest progress during the past 12 years, whilst those with full trading powers who were exercising them without contractors had made the least progress. He agreed that live contractors could not be found in districts which were subjected to rate-aided competition or to competition based on the bad business principle that what was lost on the swings of wiring could be made up on the roundabouts of supply. In an atmosphere of competition, opposition and discouragement, live contractors tended to move away to other and better fields, leaving the central station authority in full enjoyment of the remnant of "curbstoners" who were prepared to hang on and live from hand to mouth.

Mr. R. B. MITCHELL (Glasgow) said he would like to put in a plea for the contractor in a small way of business, who, he had found from experience, played a very useful function in the electric supply industry, and who would perform a still more useful function in the future, because there would be such a lot of small installation work to be done. Whilst agreeing that full powers were necessary for municipal undertakings he himself had not yet found it necessary to have an installation staff beyond such as would fulfil the internal requirements of a large Corporation. He had endeavoured to maintain friendly relations with the contractors, and in that he had been quite successful. All the work was done at schedule rates by the contractors, and just as cheaply as if it were done direct. All that was needed was supervision by the department to see that what was specified was actually provided. Having to deal with people with small incomes it was necessary to find a scheme which would come within those incomes, the people who did not own the houses they lived in. Consequently, in Glasgow, he had started, very successfully, a scheme of hire-purchase wiring, the installation work being carried out by contractors, and within a month 150 houses were dealt with; but there were something like 180,000 houses in Glasgow not supplied with electricity so that the field was very large.

Mr. H. MARRYAT (Messrs. Marryat & Place) also spoke in defence of the contractors and suggested that the gas industry would not be in the position it was as regarded getting new business, if it had not eliminated the contractor altogether in the manner it had. It was notable that Mr. Pinkney, representing the largest electric supply company in the country, and Mr. Mitchell, representing one of the largest municipalities, should have found it more satisfactory to work through contractors, and he was also pleased to hear Mr. Mitchell support the small contractor, because the fact that a man was in a small way of business did not mean that he did the work badly. At the same time, nobody had any sympathy with the "jerry" wireman. It must not be forgotten that the electric supply industry had been built up on the work of contractors and even Mr. Robinson did not always have selling powers, yet he had made progress. At the same time, it was necessary for the contractors to have the full support of the supply undertaking. After all, the undertaking reaped many times the revenue and profit from the consumer, brought by a contractor, than the contractor did. It was astounding to see the smallness of the turnover of those departments which did all their own installation work, and there were contractors who could put those figures in the shade. There were several firms in

London who were prepared to send men out at any time of the night and day to do repairs.

Alderman WALKER (Manchester) also supported the policy of working in friendly co-operation with the good contractor and so securing good work. The supply authorities should maintain a central showroom and maintain contact with potential consumers; that was a necessity and saved the contractor a lot of work, and also from having to keep money locked up in stock. At the same time he thought there should be some contribution in some form from the contractors towards the upkeep of these showrooms by way, perhaps, of a lower discount, than the full trade discount when sales of apparatus were effected. It did not seem to him fair that the supply authorities should maintain these showrooms altogether at their own expense and he was proposing to make some such suggestion to the contractors in Manchester with whom the department worked in perfect harmony. On the general question, he believed there was room for the contractor in the industry and that every endeavour should be made to eliminate bad work. As an instance of the enormous field for development, he stated that in Manchester, out of a sale of 240 million kWh, only 13.4 per cent. went for lighting and domestic power. The difficulty in Manchester was that up to two years ago the industrial power load came on at such a rate that it was impossible to do much with the domestic side but now that the new power station was at work that position was altered. In criticising the new wiring rules, the question to be answered was what was the extra cost of working under the 8th edition as compared with the 7th edition? It was very small indeed, and that was the test, and we ought to have the installation work done in a permanent and satisfactory way and not in a makeshift manner.

Mr. A. H. SHAW (Ilford) said that Ilford only had hiring powers but he had been working amicably with the contractors. Many hundreds of installations had been carried out in this way and he had never been called in for maintenance. At the same time, there was a very large amount of work to be done on hire-purchase which, however, he could not touch until he had the full powers. He also expressed the hope that it would not be thought that a small contractor was necessarily a bad one. As to the I.E.E. wiring rules, they contained the names of various Associations as having adopted them, including the I.M.E.A. He wished to know whether the names of those Associations were carried from one edition of the rules to another irrespective of whether alterations were made which were not approved by those bodies; in short, had the I.M.E.A. adopted the 8th edition of the rules? Personally, he agreed with Mr. Robinson that there was no reason to alter the old rules as to flexibles. The chief trouble had been with the connector to the piece of apparatus. He did not agree that adaptors should be cut out entirely as they were an extremely useful piece of apparatus in certain cases. The relative cost of working under the two editions of the Rules had nothing to do with the matter, in his opinion. It seemed rather that the "Safety First" microbe was at work and that the I.E.E. Wiring Rules Committee had put in every safety-first device imaginable regardless of expense.

Mr. J. W. BEAUCHAMP (Electrical Development Association) suggested that sufficient use was not being made at the present time of the existing contractors' organisations as centres of contact with the consumer. For instance, if a contractor showed in his shop window the hiring terms of the supply department, it helped to maintain contact with the public. It all helped to keep the main idea of the use of electricity in the mind of the public. Whilst there were many contractors who were fully alive to this aspect, there were a still larger number who were not and there were many matters in this connection which should be discussed between the departments and the contractors. Much more local work of this character was necessary. Another thing which might be done was on the lines of the "Red-Seal" plan in America, to indicate whether a house or premises were correctly lighted, &c. There might be some method of attaching a seal to the specification so that houses and premises would be wired according to specification "A" and so on, according to the completeness of the installation. Then the contractors might be given a bonus or some encouragement to get the houses wired on a higher grade of completeness. Perhaps there might be a Committee on the relations between contractors and undertakings, when full trading powers were secured.

Councillor HENNESSEY (Bristol) protested that at a meeting of municipal engineers and councillors, speaker after speaker should come on to the platform and support the contractor. He thought the time had come when it should be said that those who represented private firms should not be allowed to attend the Conferences. As a Socialist, he held the view that the undertakings should be run solely by the municipalities without the intervention of contractors. The sort of thing that had happened at the hands of contractors in Bristol was that rows of houses were wired and the occupants paid for the installation and then found they were a mile away from a supply cable.

Mr. A. H. DYKES (Beckenham) suggested that it should be appreciated that the paper had deliberately been written in a provocative form and that it would be well not to take seriously everything that was in it. The great point which Mr. Robinson was endeavouring to drive home was that mere reductions in price of electricity were not enough to bring about development of the use of electricity. Beckenham had full wiring powers and now worked through contractors, although a certain amount of work was done by the department. He agreed that every municipality should have full wiring powers, although it did not follow that the work would not be put through contractors. Full wiring powers were certainly necessary if small houses were to be dealt with. On this latter point two methods which had been successful, and he had introduced, were the current limiter and the fixed price light system. The latter was now being taken up by certain companies whom he advised in India, for bazaar lighting. Dealing with the wiring rules, as a one-time member of the Wiring Rules Committee he thought the Committee had fallen between two stools in bringing out the 8th Edition. It would have been better to have made the rules a code to which everyone should try to work rather than a sort of manual to which every wireman was expected to conform. They were too complicated for the ordinary wireman to understand. The difficult thing was to say that an installation which did not comply with the rules was wrong and that was why he thought it would have been better to have regarded the rules as a code for the best class of work. There could then have been a few shorter necessary rules which would have made it easier for the contractor. From his experience, the chairman of the Committee, in an endeavour to be very fair, allowed various fads of members of the Committee to be incorporated, and so it was that we had precautions against all sorts of contingencies which might or might not arise. An instance of the difficulties involved was that of a large house the wiring of which contravened practically every rule in the 8th Edition. The fire insurance company concerned was mentioned as one of those who had adopted the rules and yet when he inquired, he was told that the fire insurance company was going to pass the installation because if it did not some other company would.

Mr. J. R. DICK (W. Lucy & Co.) suggested that if the wiring rules were called "British standards for electrical installations," Mr. Robinson would fall in love with them. The difference in the cost of complying with the 8th Edition as compared with the 7th Edition of the wiring rules was not large enough to warrant the pessimistic attitude taken up by Mr. Robinson.

Mr. Robinson, who will give his full reply later, reiterated that his remarks with regard to contractors were not intended to be offensive, although they appeared to have been so taken in certain quarters. East London, however, suffered from a type of man whom, as a contractor, none of those present would care to associate with. The most important point was the question of municipal electric supply departments having full wiring powers, and no contractor need fear that these wiring powers would be put into operation by municipalities direct. They had heard of the municipalities who had found it advantageous to work through contractors, and they had also heard from Mr. Shaw, of Ilford, that he had not developed in the way he could—and he worked through contractors—because he had not full wiring powers; therefore, it would be to the advantage of the contractors if the municipalities had full wiring powers. He appealed to contractors to alter their policy of opposition and to assist the municipalities to obtain those powers in order that hire-purchase schemes could be put into operation. In Hackney at first they worked entirely through contractors; then they tried another method but had come back to working through contractors on the basis of a schedule of prices and specifications which had been drawn up in co-operation between the contractors and himself. He wished to put it perfectly plainly to contractors that municipal electric supply departments with full wiring powers would maintain small staffs for their own internal requirements and repair and emergency work, but the contractors would lose nothing by that. As to the wiring rules, he agreed that the difference in cost between the 7th and 8th editions was not much if only lighting were considered, but it would be considerable when radiators and other apparatus were fitted.

Annual General Meeting.

The Annual General Meeting was held on Friday, June 19th, in the Dome, the President in the chair.

It was announced that Mr. R. B. Mitchell (engineer, Glasgow), had been elected President for the coming year. Mr. MITCHELL expressed his thanks, as did Dr. DEWAR (Glasgow), who at the same time extended a cordial welcome to the Association to hold the 1926 Convention in Glasgow.

Mr. R. W. L. PHILLIPS (Bedford) was elected Vice-President.

The Annual Report of the Council was then presented, arising out of which a few matters were discussed.

The Report stated that the total membership stood at 217, representing 83 per cent. of the authorities eligible. The bulk of the Report related to the activities of numerous Committees of the Association, and of other bodies with which it was in collaboration. A statement had been sent to the Electricity Commissioners recommending, *inter alia*, that the coal consumption statistics which they published annually should be based upon the units delivered to the feeders and not upon units generated, and that the annual station load factor should be given. The possibility of using wireless communication between the power station and repair gangs, &c., was being investigated. The National Register of Electrical Installation contractors was commended to the members for their support. The Electric Vehicle Committee of Great Britain was about to be amalgamated with the Electrical Development Association. A report had been submitted to the Electricity Commissioners with regard to the development of electricity supply areas, containing a number of recommendations relating to generation,

transmission, and distribution, and to the extension of the scope of fringe orders. The Association had pressed upon the B.E.S.A. the desirability of adopting 250 V as the standard voltage of supply, but the decision was in favour of 230 V. Approval was expressed of the Illumination Design Courses organised by the E.L.M.A., as adding to the efficiency of salesmen, and the importance of contributing to the funds of the Electrical Research Association was emphasised, a scale of subscription based upon output being put forward for the guidance of electricity supply committees.

The accounts showed that the income for the year was £2,449, and the expenditure £2,280, leaving a surplus of £169. The balance sheet recorded a surplus of assets over liabilities of £2,518.

E.D.A. Subscriptions.—Councillor GOUGH (Cardiff), asked for expressions of opinions with regard to the new scale of subscriptions to the E.D.A., *viz.*, one-tenth of one per cent. of the revenue of the undertaking. Whilst he himself supported the new scale he was having difficulties with some of his committeemen. In the case of Cardiff it meant an increase in the subscription from £60 to £120.

The PRESIDENT said that strictly this was not a matter for the I.M.E.A. at all, but for the individual undertakings to make up their minds about. The I.M.E.A. Council merely recommended that the new scale should be adopted.

Councillor MCLEOD (Hull) expressed the view that if the money was for propaganda, not many councils would agree. If it were for research it was another matter. Councillor PEARLMAN (Hull) said that in the case of Hull the subscription would be increased from £60 to £300 and he thought the meeting should give a decision as to whether the new scale should be adopted. Mr. J. CHRISTIE (Brighton) said his subscription would be increased from £50 to £200, but every penny of the money would be well spent. Alderman WALKER (Manchester), said there would also be a considerable increase in the subscription from Manchester, but he supported the scheme fully.

Calorific Value of Coal.—On the motion of Alderman WALKER (Manchester), seconded by Councillor HAMMER (Hackney), a resolution was passed that an endeavour be made to secure direct representation for the I.M.E.A. on the Joint Committee formed by the Institutions of Civil, Mechanical, and Electrical Engineers, to deal with the question of moisture in coal and a test for calorific value. Certain work was done as the result of Mr. Miles's paper last year on "Power House Chemistry," but it had been abandoned in consequence of the appointment of the committee mentioned. It was felt by the meeting that the I.M.E.A. should have direct representation, although Mr. R. A. Chattock was on the committee representing the Institution of Electrical Engineers.

Standard Voltage.—The Council reported, in connection with the proposal of the B.E.S.A. that the standard voltage should be 230 volts, that it had passed a resolution that 250 volts was the more desirable figure. Mr. N. STANILAND (Hornsey) moved that the Council's resolution be confirmed, but the proposal was rejected by a large majority, the general opinion being that the standard voltage should be 230 volts. The hon. secretary intimated that the resolution in favour of 250 volts carried by the Council was not unanimous.

The Annual Report was then adopted.

Wiring Powers.—A long and lively discussion took place upon a resolution moved by Councillor THICKETT (Grimsby), instructing the Council to take steps to secure legislation which would give full wiring powers to all municipal electricity supply authorities. A long and detailed amendment to this was sent in by the representatives of Hackney, which Councillor Thickett said he was prepared to adopt. This amendment, in fact, set out the wiring clause in the Woolwich Act of some 20 years ago, and instructed the Council to take the necessary steps to make this general to all municipal authorities.

Strong objection was taken to the Hackney amendment by a large number of those present, on the ground that it would tie the hands of the various authorities to a particular form of wording which they had not had an opportunity of considering. Others preferred the original Grimsby resolution, which left the matter in the hands of the Council to a large extent. Various other amendments were proposed and objected to, including a proposition that the matter should simply be left in the hands of the Council to deal with.

Eventually, the Grimsby resolution, with certain modifications, was passed in the following form:—

> "That this Association consider the advisability of initiating legislation giving powers to municipal electricity undertakings to sell and install on the hire-purchase system or otherwise, electrical apparatus, such as cookers, stoves, &c., and also powers enabling such undertakings to finance and carry out through wiring contractors or otherwise, wiring installations, and to charge a rent in respect of such wiring installations, or recover the cost thereof on the hire-purchase system or otherwise."

Assessment of Electricity Undertakings.—A proposal was made on behalf of the Watford electricity undertaking that the matter of the increased assessments of electricity undertakings should be referred to a special committee, and this was agreed to.

Expenses of Members of Council.—On the motion of the delegates from Barrow-in-Furness, the desirability of making arrangements to pay the expenses of members of council was referred to the Council for consideration.

Bulk Supplies.—The Gillingham Corporation proposed that the matter of safeguarding the interests of those authorities taking bulk supplies be considered by the Council, and this was agreed to.

Joint Boards and Membership.—It was agreed to instruct the Council to take the necessary steps to alter the Articles of Association so as to admit to membership of the I.M.E.A. Joint Electricity Boards composed entirely of local authorities.

Chairmen's Meeting.—A resolution from the meeting of chairmen held on June 16th, recommending that the chairmen's meeting in future be a permanent part of the Convention proceedings and not an informal meeting was confirmed.

The usual votes of thanks to those who had assisted in the Convention arrangements closed the annual meeting.

(To be continued.)

The National Physical Laboratory.

Annual Inspection by the General Board.

THE annual inspection of the National Physical Laboratory by the General Board took place on June 23rd. On the arrival of Sir C. Sherrington, President of the Royal Society, with Lord Rayleigh and other guests at the new lodge, the director of the laboratory, Sir J. E. Petavel, invited the president to perform the ceremony of opening the Queen's Road entrance. The guests were addressed by the president and Lord Rayleigh, the former then receiving a special key from Sir L. Earle, secretary, H.M. Office of Works, with which he opened the gates; and he then declared the new roads open.

The new road scheme was undertaken as the first necessity in the development of additional land that was acquired in 1920 to meet the growth of the laboratory, which has been continuous since its foundation 25 years ago. The scheme offered an opportunity of improving the approaches to existing buildings and convenient access has been provided to the Admiralty Research Laboratory, to the new laboratory recently erected to meet the needs of the Chemistry Co-ordinating Research Board, and to other buildings on the new site.

Tea was provided during the afternoon, and in the course of their tour of the various departments numerous experiments were watched and apparatus examined by the visitors.

In the Aerodynamics Department the electrically-heated wire method of measuring rapidly fluctuating wind velocities is employed. The experimental difficulties are accentuated by the fact that anemometers of normal design are subject to a "lag" and cannot follow the variations of speed sufficiently faithfully, but with the finest platinum wires, one-thousandth of an inch in diameter, 2 or 3 fluctuations per second are faithfully recorded; even with instruments designed as carefully as this a pronounced lag is experienced for more rapid variations of speed. A full understanding of the laws which govern air flow claims first importance in aeronautical research. The investigation of those complicated problems is facilitated by a device known as the electrical tank. Its application is based upon the fact that air flow patterns in theory have features in common with an electrical field. The rectangular tank (5 ft. long and 2½ ft. wide) is filled with slightly acidulated water, and an alternating current of audio-frequency is passed between thin metal plates mounted on the two longer walls of the tank. The model to be studied (*e.g.*, an aeroplane wing), is fixed with its span vertical in the centre of the tank, and observations are made on the resultant electric field, for which purpose two exploring electrodes are used, connected to a 3-valve low-frequency amplifier. The observer is provided with headphones, and one electrode is moved until no sound can be heard. With the use of linkage attached to the moving electrode, the field is readily mapped on paper and the curves obtained are compared with the actual air pattern as determined in the wind-tunnel.

In the Metrology Department, amongst a variety of exhibits dealing with precision measurement, was an example of length measurement by means of the interferometer. A new form of cadmium lamp, recently invented by M. Hamy, was also shown; the waves of red light from the lamp are used as a fundamental unit by which all other light waves are measured and their extreme smallness may be realised from the fact that there are nearly 1½ million waves of red light in a yard. A method of depositing a film (from 1 to 2 millionths of an inch thick) of silver upon glass is to pass an electrical discharge through a vacuum chamber having a silver electrode, in the neighbourhood of which lies the glass to be silvered. The silvered-glass plates are used in interferometry methods of measurement.

In the Electrotechnics Department the new standard power-measuring apparatus includes a new precision electrostatic wattmeter. The standard type of instrument used for measuring the amount of power in an alternating circuit has been re-designed in detail, and a new one constructed to supplement that which has been in use for some years. The equipment includes very accurate voltmeters, all the instruments indicating the values of the quantities on a circular scale about 21 ft. long. These instruments are used for determining the corrections to be applied to instruments used for important measurements of power throughout the country, including instruments for adjusting ordinary domestic meters. It is important in many tests to maintain the frequency of the current, when testing instruments for use on alternating circuits, very accurately at the value at which they are to be used.

A special three-phase alternator has been attached directly to the shaft of the main machine; this alternator is connected directly to a special synchronous motor, which may be placed in the locality where it is desired that the speed should be indicated. It carries a ground glass disk on which a pattern is marked in black; the disk is illuminated from behind by flashes of light from a neon tube, which are of very short duration and produced by the motion of an accurately adjusted tuning fork, kept automatically vibrating on the electric bell principle. If a suitable repeating pattern depending on the speed is marked on the disk it can be made to appear to be at rest for certain particular frequencies, such as 50 cycles per second, when illuminated in the manner described. If the speed differs slightly from the proper value, the pattern appears to rotate slowly backwards or forwards. The whole arrangement requires no attention on starting up the main machine other than starting the tuning fork, the motor driving the rotating disk being self-synchronising.

The effect of an electric field on the operation of a thermionic valve was demonstrated with the aid of a metal plate, electrified by a battery and fixed on a pendulum which was made to swing past a fixed plate attached to the grid of a valve. Every time the pendulum approached the conductor connected with the grid it caused a variation in the current flowing in the anode circuit of the valve. The variation may be either an increase or decrease according to the polarity of the charge of the swinging plate, and the effect may be amplified by valves in cascade, so that either small movements of the plate or small voltages can be made to produce a measurable indication.

During an investigation to determine the most suitable methods of making electrical earth connections, interesting effects of the movement of moisture with the passage of a small current were obtained, and the special d.c. generator (giving 5,000 volts) has been used for testing specially impregnated timber used for protecting railway track workers from accidental contact with live rails.

The high value of land in congested areas often imposes upon architects restrictions of the severest nature as regards the provision of daylight in large block buildings. It has been estimated that the cost of daylight for such a building on a valuable site may be as much as £4 or £5 per annum for each room. Experimental work on the subject is being carried on in the Photometric Division of the laboratory.

In the Physics Department, in connection with sound-wave photography, a single spherical sound pulse is produced by the passage of an electric spark across a short gap and by means of a second illuminating spark gap activated after a suitable time interval the shadow of the pulse can be photographed. This method can be used for testing the acoustic properties of buildings by the use of sectional models.

Work has been done on determining the best manner in which to set diamonds which are used as pivots in various scientific instruments. The direction of the cleavage planes of the diamond with reference to the bearing surface has been found to be of great importance. In the Metallurgy Department there was seen what is perhaps the finest equipment for the experimental study of metals to be found anywhere in the world.

While the foregoing are but a few of the 180 items to which special attention was directed, they will serve to indicate the all-important role of the laboratory and its competent staff in the advancement of science and its application to national and industrial problems.

New Electrical Devices, Fittings, and Plant.

(Readers are invited to submit particulars of new or improved devices and apparatus.)

The Thermofan.

The accompanying illustration, fig. 1, shows one of the latest products of MESSRS. MATTHEWS & YATES, LTD., Swinton, Manchester, the cyclone patent thermofan. This device comprises a fan, intended to be coupled to a steam turbine, and an air heating element through which the exhausted steam from the turbine is passed, the heated air being circulated by the fan, thus providing an economical supply of heated air. This unique machine is claimed to be suitable for plenum heating, laundry work and drying by hot air, or for any other process where a large volume of warm air is required.

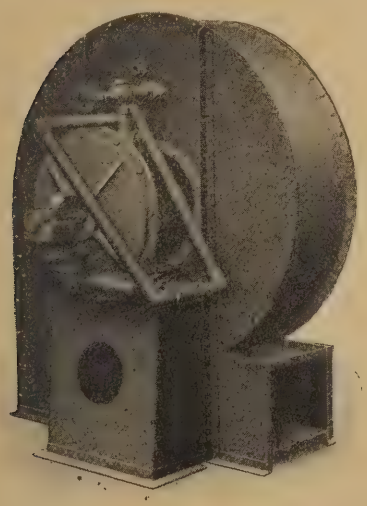

Fig. 1.—The Thermofan.

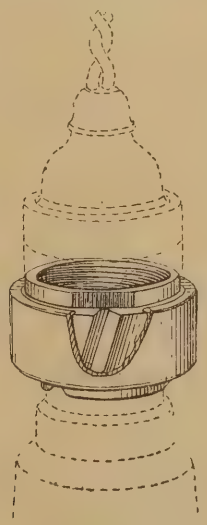

Fig. 2.—The "L.P." Electric Lamp Lock.

A New Electric Lamp Lock.

We illustrate herewith, in fig. 2, the "L.P." lamp lock, a device designed to prevent the removal of electric lamps by unauthorised persons, which is about to be marketed by MESSRS. G. P. PECKHAM & CO., 4-5, New Compton Street, Charing Cross Road, London, W.C.2. The device comprises two rings, inner and outer, with a one-way clutch between them, so that the inner ring may be turned by rotating the outer ring in one direction, due to the engagement of the clutch; but the free-wheel action of the clutch prevents this dual action in the opposite direction. The inner ring is threaded so as to engage with the lamp holder. The lock is first placed over the lamp cap, and the lamp fixed in the holder in the usual manner. The inner ring is then engaged with the lamp holder, an internal flange at the bottom locking the lamp by engaging with the lamp pins projecting from the slots in the holder. An additional lock is provided for the inner ring by means of the shade carrier ring of the holder. To release the lamp the inner ring is unscrewed by means of a special key which is fitted to the upper edge of the inner ring projecting above the outer ring, by means of two flattened milled sides.

Constant-Peripheral-Speed Electric Grinder.

The accompanying illustration, fig. 3, is of a double-end electric grinding machine, which, according to *American Machinist*, will maintain a constant peripheral grinding speed regardless of the wheel diameter. The machine is marketed by the UNITED STATES ELECTRICAL TOOL CO., 2,488, West Sixth Street, Cincinnati, Ohio. The wheel guards are mounted on gibs which are moved back as the wheel wears down. The gibs are attached to a speed controller so as to operate the controller, when displaced due to wear on the wheel, to such an extent that the motor speed is varied sufficiently only to

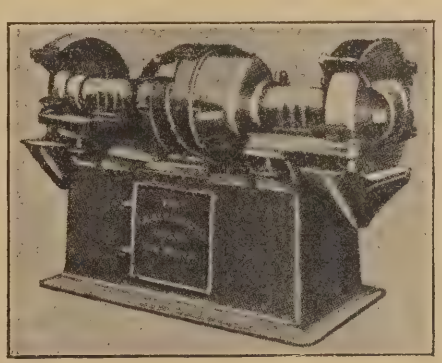

Fig. 3.—Constant-Peripheral-Speed Grinder.

maintain a constant peripheral speed on the grind wheel. The motor is totally enclosed and the bearings throughout are of the S.K.F. heavy-duty type.

Device for Testing Wire Wheels.

The diagram in fig. 4 illustrates the method employed for electrically testing wire wheels, to determine if the rims run true, by means of a device described in *Machinery*. The testing machine is built up on a frame A, from which an adjustable pin B projects to accommodate wheels of different diameters. The wheel C revolves on the pin so that the rim, if out of true, will make contact with one or both of the contact pins H during one revolution. These contact pins are held in and insulated from steel containers. The pins are connected in circuit

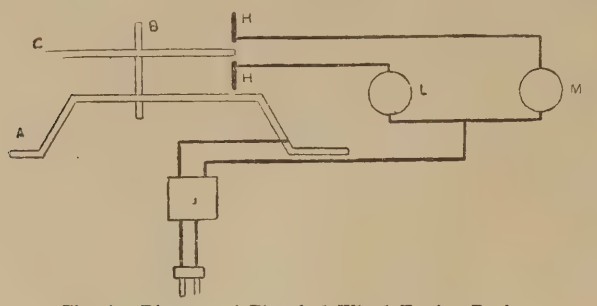

Fig. 4.—Diagram of Electrical Wheel Testing Device.

with two lamps L and M, a transformer J (decreasing supply pressure), and the framework of the device, to a source of supply in such a way that contact between the top or bottom of the rim and the top or bottom contact pin will light one of the lamps accordingly. One revolution of the wheel is sufficient to determine if it is accurate within the required limits. In the case of wheels that do not pass inspection, the single revolution on the testing machine serves to mark the rim in such a way that the workmen will know exactly where trueing up is required.

New Insulation for Leadless Cables.

We have received from HOMOGENEOUS CABLES, LTD., 43, Stadhoudersplein, The Hague, some particulars of two of their recent products, a new insulation "Karetnja," and leadless cables insulated with this product. "Karetnja" is a kind of bitumastic material, invented by Mr. Ali Cohen, the inventor of "Liconite." The makers claim that "Karetnja" is impermeable to water and possesses excellent electrical qualities, and that cables insulated with it can be used quite safely without lead sheathing.

The material is made in two forms, one for insulating the cores of cables, and one for use as outside sheathing. The inside insulation is somewhat softer than the outside sheathing, and it becomes slightly plastic at 100 deg. C., but still retains its elasticity and capacity for bending. It is also claimed that microscopic examination of the sheathing bent round a cylinder having a diameter of only three times the thickness of the material, fails to reveal any change in the state of the material. The use of this insulation renders cables extremely light; a 3 by 16 sq. mm. 10,000-V cable is said to have a weight of 1.7 kilo-gm. per metre.

Provision against mechanical damage is made by the use of a jute braiding applied over the sheathing. It is further claimed that the material is immune from the action of dilute acids, alkalis, oils, &c.

In order to avoid the possibility of the existence of electrostatic and electromagnetic fields on the "Karetnja" sheaths in the absence of metallic sheaths, the makers suggest a certain simple method of manufacture which does not appreciably alter the cost or weight of the cable.

Pressure tests on samples of the material 1.07 mm. thick, show a mean rupturing pressure of 38 kV, and on samples 10.0 mm. thick, 105 kV.

Tests on the cable after 24 hours' immersion in water show 0.72 per cent. dielectric loss on a 30 kV cable, insulation resistance per km. at 15 deg. C., 750 megohms, and the dielectric constant induce capacity in microfarads per km. at 15 deg. C., 0.394. The tests were repeated and the same results obtained 28 days after the immersion in water.

The New "Mazda House."

A FEW weeks ago we announced the opening of new showrooms at "Mazda House," Newman Street, W.1, by the British Thomson-Houston Co., Ltd. These are now in full working order and we recently had an opportunity of inspecting them. The new "Mazda House" is in an excellent position in one of the principal West End thoroughfares and is thus well served by omnibuses, &c.

The main showroom, part of which is shown in fig. 1, is a commodious one running the whole length of the building, and a very large selection of lighting fittings is displayed in a tasteful manner. Off the main body of the room are three small rooms arranged as a bedroom, dining room and study, each with appropriate lighting. In addition, there is a series of alcoves (fig. 2), in which the effects of any selected fitting can be demonstrated. By an ingenious bayonet type of ceiling fitting, combined with a pull switch, any lighting fitting can be readily taken down for separate demonstration or sale. On the ground floor other lighting fittings, more of the "utility" type, are shown. Here also is a collection of domestic heating, cooking, and labour-saving devices. Adjacent to this is a

Fig. 1.—A Part of the Main Showroom.

room set aside for the demonstration of "Tungar" rectifiers, a washing machine, a cooker, and exhaust fans. The lower ground floor is devoted principally to commercial and industrial lighting, one of the most attractive features being two shop windows which are placed at the disposal of firms who

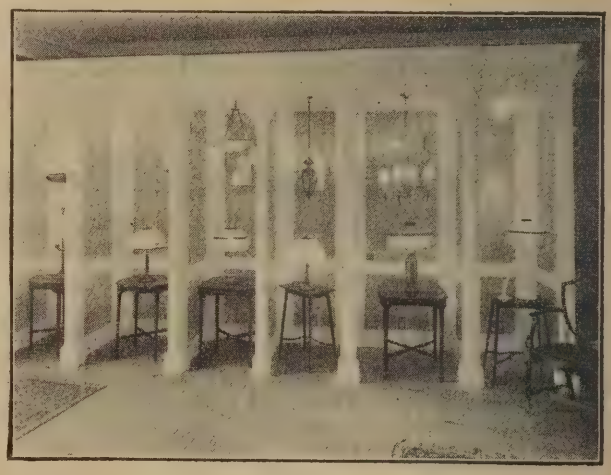

Fig. 2.—Alcoves for Demonstrating Individual Fittings.

require special arrangements for illuminating their goods with coloured light. There are also "Posterlite" fittings, projectors, and office and works lighting units. Radio apparatus of all kinds is also displayed on this floor. The two upper floors are devoted to offices, among which is the Lighting Ser-

Fig. 3.—Trade Counter.

vice Department, in which fittings are designed in accordance with customers' special requirements. The Newman Street entrance is flanked by well-arranged display windows which give the exterior an attractive appearance. A rear entrance leads to a trade counter (fig. 3) which is arranged for rapid and efficient service.

Selected Radio-Telephone Apparatus.

Recent Developments and Improvements.

The Marconi-Osram DE3B Valve.

The resistance-capacity method of inter-valve coupling possesses several important advantages, namely, distortion effects due to transformer losses are entirely eliminated, amplification is practically independent of the frequency over the entire range of speech frequencies, and the h.p. current consumption is low. The main disadvantage, however, is its low amplifying power, and, as the step-up must be performed by the valve, the latter should have a high amplification factor combined with low impedance. To meet these conditions, the Marconi-Osram DE5B valve has been designed with an amplification factor of 20 and an impedance of 30,000 ohms. Introduced several months ago, it has met with success not only as a resistance-coupled amplifier, but also when performing other functions, but although the current consumption is only 0.25 amp. the use of a number of these valves in multi-stage amplifiers, such as the supersonic heterodyne receiver, would result in a considerable demand on the accumulator. To overcome this disadvantage, the M.O. Valve Co., Ltd., has introduced a new valve, known as the DE3B 0.06-amp. type, operating at the same filament voltage (2.8), but having a much

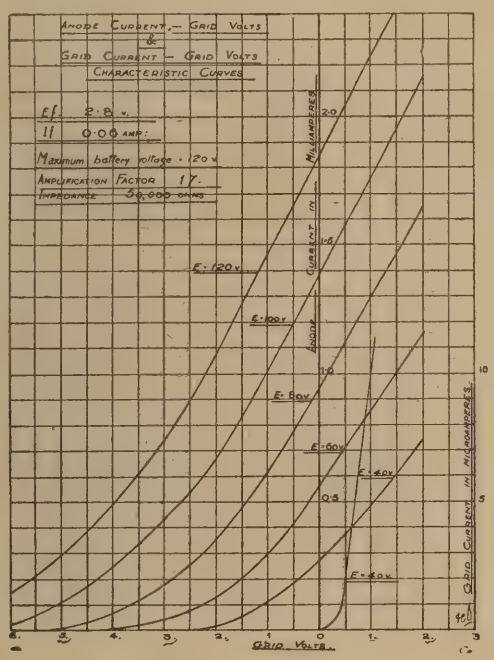

Fig. 1.—Characteristic Curves; Marconi-Osram DE3B Valve.

higher voltage amplification factor than the DE3 type; it has been found possible to design this valve with an amplification factor of 15, and still retain the comparatively low impedance of 50,000 ohms. It follows, therefore, that while the DE5B pattern remains the better valve from the point of view of characteristics, the economical operation of the DE3B type will commend its adoption in many cases. The characteristic curve, fig. 1, indicates that the DE3B valve can deal with a grid swing of about 2 volts at 120 h.p. volts, without working round the bottom bend, as the plate current characteristic is straight to a negative value of about 4 grid volts.

Thus, with the maximum h.p. voltage allowable (120), the DE3B type provides volume without distortion up to two stages of audio-frequency resistance coupling, using a negative grid bias of 1½ volts; for the last stage a DE3 valve may be used, but, if very strong signals are being received, type DE4 should be substituted. As a h.f. and detector valve, the DE3B will give better results than the DE3 type on weak signals, and it detects the short waves from KDKA (68 metres) well when followed by a DE3 as a l.f. amplifier. The DE3B is unsuitable for operating as a transformer coupled l.f. valve, as its impedance is too high for this purpose.

The "Acme" Filament Resistance.

The new filament rheostat illustrated in fig. 2, which is made by the Acme Production Co., Ltd., is of an original design. Its feature is the contact, which is of a roller type, secured to a phosphor bronze spring, thus avoiding the conventional method of rubbing contacts and giving a constant pressure on the inner surface of the resistance. By this design smooth control is combined with silent operation and the maximum gradation of the resistance without the use of any fine adjustment. These rheostats are made for one hole fixing and are stocked in 15- and 30-ohm sizes suitable for either bright or dull-emitter valves, and are complete with knob and pointer. There are no complicated parts to get out of order and the workmanship is good.

A New Porcelain Insulator.

In view of the fact that porcelain insulators have hitherto always been used in compression, the example illustrated in fig. 3 is of interest because it will actually withstand a direct pull of several hundred pounds quite safely. It is known as the "Climax low-loss" insulator, and its makers claim that it will stand four times the flash-over voltage of the ordinary shell, or egg, type, and has far less capacity to earth. It is made of the same vitreous porcelain as 100,000-V insulators for transmission lines, and is non-hygroscopic. It is a product of Climax Patents, Ltd.

The Mullard S.6 Valve.

The S.6 pattern is a dull-filament valve designed by the Mullard Radio Valve Co., Ltd., primarily for "anode bend" rectification. In this method advantage is taken of the curvature of the lower part of the anode current-grid voltage curve, whereby h.f. oscillation on the grid causes an increase

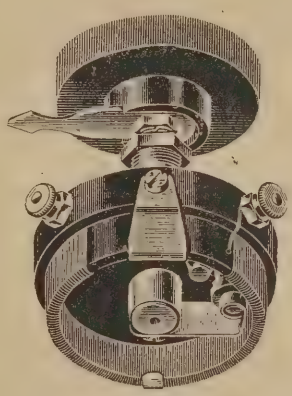

Fig. 2.—The New "Acme" Filament Rheostat.

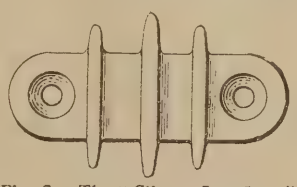

Fig. 3.—The "Climax Low-Loss" Insulator.

Fig. 4.—The Mullard "S.6" Valve.

in the mean anode current. It is important for this purpose that the characteristics of individual valves should not vary to any considerable extent from the accepted standard, and S.6 valves all meet this condition, it is claimed. Their amplification-factor (22) and impedance (100,000 ohms) are high, and they can be used with success as h.f. amplifiers and as resistance-capacity coupled amplifiers. In the latter case a h.p. voltage of from 150 to 200 volts is recommended with an anode resistance of from 100,000 to 200,000 ohms. A filament current of 0.2 amp. at 3 volts should not be exceeded, and an important feature of these valves, one of which is shown in fig. 4, is the helmet-shaped moulded cap which yields low inter-electrode capacity. The valve occupies small space and fits standard anti-capacity clips.

"Lilliput" Headphones.

Under the above name new headphones have been introduced by the Sterling Telephone and Electric Co., Ltd., to meet the demand for reliable instruments for general radio use. The magnets are made of tungsten steel, and the bobbins are carefully wound with best-quality wire and impregnated to prevent any possibility of corrosion. The gap between the Stalloy diaphragm and the pole-pieces is adjusted by grinding the pole-pieces. The headband is made of springy steel wire covered for its greater part with leather; adjustment to the head is easy. These 'phones, including the cords, which are totally enclosed, weigh 9½ oz., and the sample sent us gave good results and was found to be very comfortable in use.

New "Excel" Clips.

We have received from Messrs. S. H. Collett samples of some new saw-tooth jaw clips which are of general utility for making temporary connections. One of their points of advantage is the fact that the neck has been made of such a size as to accommodate any size of cable, or flexible, or a number of wires as may be required.

Parliamentary News.

[By Our Special Parliamentary Reporter.]

The Mersey Tunnel Bill.—On June 24th and succeeding days, having heard the case for the promoters of this Bill, the Select Committee of the House of Lords commenced to hear the evidence on behalf of the opposition.

Mr. MONCRIEFF, K.C., who represented the Mersey Railway Company, said that although there was at times great congestion at the riverside, there was no justification for such a costly scheme as was proposed, which would seriously interfere with the business of existing transport undertakings.

Mr. J. FALCONER, chairman of the Mersey Railway Company, said that his undertaking had had a great struggle in the past but was now proceeding towards prosperity. If the tunnel were sanctioned it would be very detrimental to the company.

Similar evidence was given by other witnesses. The proceedings concluded on June 30th, and the Committee signified its approval of the Bill.

Electric Lighting on Railways.—On June 22nd, Colonel DAY asked the Minister of Transport whether he was aware that many carriages on the Southern Railway, Brighton Railway section, were rendered objectionable by obnoxious gas fumes, due to leaking gas containers under the carriages; and would he make representations to the company suggesting that in the interests of public safety these carriages be electrically illuminated.

Col. ASHLEY said it was a recommendation of his Department that all new or reconstructed passenger stock should be electrically lighted, and the Southern Railway Company had adopted this practice. The company stated that any case of leakage which might be brought to its notice would receive immediate attention.

Wireless Aerials.—On June 22nd, Sir K. WOOD, Parliamentary Secretary to the Ministry of Health, informed Rear-Admiral Beamish that no objection had been raised by the Ministry to the erection of wireless aerials on State-aided housing schemes provided that the usual precautions were taken for the proper earthing of the installation.

Telephone Deposits.—On June 22nd, Sir W. MITCHELL-THOMSON, the Postmaster-General, informed Mr. W. Thorne that the minimum telephone deposit had been reduced to £1 and those subscribers who had deposited £1 10s. would be THOMSON, the Postmaster-General, informed Mr. W. Thorne credited with 10s. through the accounts to be rendered in July, except in cases where the charge for the quarter's calls appreciably exceeded £1 10s.

Wireless at Sea.—On June 25th, Sir P. CUNLIFFE-LISTER, President of the Board of Trade, informed Mr. B. Smith that representations were made some time ago to the Board of Trade and the General Post Office that, owing to the small field for training wireless operators at sea, great difficulty was being experienced in complying with the requirement that operators in charge of a ship must have had 12 months' sea service; and that unless some action were taken to amend the rules, there would soon be a serious shortage of experienced men available for the sea service. The matter was very fully discussed by the Board of Trade and the Post Office with representatives of the wireless telegraphy companies, the shipowners and the Association of Wireless and Cable Telegraphists. As a result of these discussions, the Board and the Post Office came to the conclusion that it was advisable to reduce the requirement to six months' service.

Gas Companies and Electricity.—On June 26th, in the House of Lords, LORD RAGLAN moved the second reading of the Statutory Gas Companies (Electricity Supply Powers) Bill, which enables statutory gas companies to apply for Special Orders under the Electricity (Supply) Acts to empower them to apply their funds or to borrow money for electricity purposes.

LORD BANBURY opposed the Bill, contending that it took from Parliament powers which it had exercised almost from time immemorial and bestowed them on the Electricity Commissioners, who were practically responsible to no one, and the future composition of whose body no one knew. The Commissioners would be able to grant concessions which had a pecuniary value and that power might lead to corruption. The Bill also enabled the Commissioners to grant powers to gas companies in areas in which electricity companies had already got powers and were subject to statutory obligations.

LORD DONOUGHMORE, Chairman of Committees, pointed out that these Special Orders remained subject to the control of Parliament in each individual case.

LORD PEEL, speaking for the Government, did not suppose the effect of the Bill would be very large, but its operation would probably be very useful in those areas which were not supplied with electricity, and were not of such a character as to encourage the ordinary electricity undertaking to enter for the purpose of giving a supply. He thought they might have full confidence in the Electricity Commissioners.

The Bill was read a second time.

The Government and Unemployment.—In the course of his reply to the vote of censure, in connection with the increase of unemployment, moved by Mr. Ramsay MacDonald, on June 29th, the PRIME MINISTER stated that the Government had a practical scheme of electrical development under examination. If the Committee which was considering it reported that the scheme was workable the Government would immediately take the necessary steps to enable it to be carried out. The Premier also mentioned the importance to industry of scientific research, which, he said, would always be aided by the Government. Referring to low-temperature carbonisation, he said that if the results of the East Greenwich experiment justified it, the Government would consider the erection of a plant on a commercial scale.

Correspondence.

***Correspondents should forward their communications* at the earliest possible moment.** *No letter can be published unless we have the writer's name and address in our possession.*

Installation Policy.

Mr. L. L. Robinson, at the I.M.E.A. Convention at Brighton, faced with characteristic courage the very real and vital problem of the extension of electricity supply into the homes and premises of the great mass of the people.

This important paper, not to speak of its subject matter, is not discussed in the present communication. A few points only are considered which call for immediate comment.

He remarks that the primary object of a wiring contractor is to make a profit. Had this been so, the financial strength of the contracting industry would not have left it so helpless in the face of piratical attack from municipalities or others who imagine that they could rule more to their advantage the provinces they covet.

Mr. Robinson says that "electrical contractors have come into existence through no fault of their own, but because in the early days suppliers of electricity entirely neglected 'the service to the consumer' end of the business." Before 1880-81, contractors were engaged upon arc lamp installations, A B C telegraph lines, electric bells and signals, and latterly telephone work. Then their early enterprise founded the electric light industry. They had to devise and make their own accessories and experiment with wiring methods, and I see very little in use to-day that was not tried in those early days. Where no existing mechanical power drive was available, they installed gas engines, steam sets, or water power to drive their dynamos. During the next ten years they dotted not only the towns but the whole country with private installations before ever there were any municipal engineers to speak of. The "Chiefs" of public supply stations may now be eternal with a hankering after omnipotence backed by taxation—but they had a beginning.

Nor did the earliest supply stations themselves come into being without the eager enterprise of contractors. In Scotland, probably also elsewhere, some of the pioneer stations were largely, if not entirely, conceived and founded by wiring contractors. These contractors had the ear of the public and gave at least enthusiastic and effective support to all good public schemes. They still do so in a measure. By far the greater part of the existing load was built up by the personal efforts of the wiring contracting trade. To-day every extension of area acquired by a supply authority delivers a harvest of independent plant installations sown by the contractors and reaped by the supply people without compunction or any compensation to those who have pioneered and prepared the field.

We do not hear of any movement in the Contractors' Associations to reduce the supply chief to the position which Mr. Robinson desires for the contractor, which is that of a compulsory servant of his destroyer, underpaid, overtaxed, robbed of all freedom, independence and initiative, forced to contribute to rival showrooms, but for his own, charged full rates for electricity used for advertising electricity supply.

Yet two problems remain—the "curbstoners" and the cheap wiring system. These demand further consideration.

Meanwhile each electrical contractor of vision will hasten to apply for formal registration. This subject also has its difficulties, but if all pull together, they can be solved.

Donald S. Munro, M.I.E.E.,
Registered Electrical Installation Contractor.

Edinburgh, *June 22nd*, 1925.

The Electrocution of Rats.

Forgive me for pulling your leg, but if any reader can advise us whether a scheme for the extermination of rates by electrocution has ever been devised, will he add if it can be applied to rate collectors?

Francis Thos. Fawcett.

Woodford Green, *June 22nd*, 1925.

[We fear the millennium is not yet due—only the rates.—EDS. ELEC. REV.]

A British Institute for Radio Engineers.

It would be of great interest to have more light on Mr. Nelson's proposal to form a new engineering society. In his letter he deals fairly fully with the constitution of the new society, but beyond stating that a really technical society for

wireless engineers is wanted in Britain, he does not put forward any real arguments in favour of such a step. Personally I can see several arguments *against* the proposal, and to put forward a materialistic point of view first I would mention that most engineers already pay quite enough annually in the form of subscriptions. From this point of view alone we want to limit the number of societies as far as possible. But the real point is: is there a real need for such a society as is proposed by Mr. Nelson, from the *technical* point of view? Apparently Mr. Nelson's objection to the Wireless Section of the I.E.E. is that one must be an electrical engineer before one can join the Wireless or any other section of the I.E.E. But surely this is as it should be, for a fully qualified wireless engineer must of necessity be an electrical engineer. I take it that the proposed new society is intended for those professionally engaged in the engineering aspect of wireless, and it therefore seems to me that the Wireless Section of the I.E.E. exactly covers all the ground and there is no sound argument for this ground being shared by a new society.

Incidentally, I notice that Mr. Nelson has discussed the matter with several "advanced *amateurs*." Why should amateurs, however far advanced, be interested in the formation of a *professional* society? There is already a technical society for amateurs, the Radio Society of Great Britain, and I think it is very desirable that the amateur and the professional interests of wireless engineers should be looked after by separate bodies. These two separate bodies already exist, so why worry?

J. F. Stanley, B.Sc., A.C.G.I.

London, *June 27th*, 1925.

[Mr. Nelson asks that all letters on this subject should be addressed to 66, Oxford Road, Manchester.—EDS., ELEC. REV.]

The Value of Super-Power Schemes.

The fourteenth annual report on the Toronto hydro-electric system, for the year ended December 31st, 1924, has just come to hand, and I quote the following figures therefrom:—

Kilowatt-hours sold: 485,708,476.

Net cost of energy purchased in bulk: 25 dollars per h.p.

The comparative figures for 1921 are as follows:—

Kilowatt-hours sold: 221,384,558.

Net cost of energy purchased in bulk: 18.54 dollars per h.p.

Despite an increase, therefore, of 120 per cent. in sales, there is an *increase* in the cost of bulk supply of 35 per cent. This, however, does not complete the story, and I quote the following paragraph in full from the report:—

"*Rates.*—At the date of issuing this report, it does not appear likely that the present rates will be entirely sufficient to meet operating and fixed charges and the cost of power during the year 1925, and it is possible your Commissioners will be under the necessity at the end of the year of making an appropriation from the system's reserve for the stabilisation of rates, which is fortunately ample. Your Commissioners believe it is better to meet the situation in this way, rather than to apply to the Hydro-Electric Power Commission of Ontario for authority to put into effect an increase in rates which would be severely felt by the customers of the system under existing industrial conditions. It is hoped that improvement in general business will before long enable your Commissioners to meet all charges with the existing scale of rates."

This demonstrates once again that there is an economical limit of expansion to any business or undertaking, and the following extract from the report of the Royal Commission on London Government further confirms this:—

"In 1911 a notable article in the *Journal* of the Royal Statistical Society on "Population and Costs in relation to City Management," was referred by the County Council to their comptroller and assistant statistical officer for their report. After some criticisms of the article, these officers reported as follows: 'The general conclusions of the writer of the article in question, however, appear to be borne out by the tables accompanying this return. It will be seen that the cost of administration per head of population shows an upward tendency as the size of the town increases, and dividing the towns given into two groups, it will be seen that the cost per head in towns of a population of 250,000, or over, considerably exceeds that in towns with a population under 250,000. . . ."

Will our super schemes prove an exception?

F. W. Purse,

Engineer and Manager, West Ham Electricity Dept.

Stratford, *June 24th*, 1925.

Technical Journals for Boys.

I have read with interest the letter on "Technical Journals for Boys," and the remarks by "Junior" on young engineers' clubs. I am teaching under the L.C.C., and am anxious to assist in developing young engineers or technical workers interested in anything connected with their work, apart from their daily "going to work," and to induce them to take advantage of the facilities for technical training offered in evening classes which a large number of day workers treat as a task instead of a valuable addition to their "daily grind."

I am willing to offer my services to "Junior" for one evening a week, either to assist in his scheme for a club or to lecture for one hour on an engineering subject without remuneration, and may perhaps induce some students to join. Or I would write a short practical article for the technical journal (free) for young engineers on engineering subjects periodically.

Arthur J. Rayner, A.M.I.Mech.E.,

Late Indian Educational Service, Bengal.

London, *June 19th*, 1925.

Charging for Light.

As so many lighting consumers do not understand the value of a "unit" or one kilowatt-hour, would it not do to say it is equal to two thousand candle-power-hours, and that is what they will obtain provided efficient "half-watt" lamps are used?

Gas is generally charged at so much per 1,000 cubic feet, but that conveys no idea to the ordinary consumer as to what lighting power it will give. It is the same with the electricity bill, so much per 1,000 watt-hours or per unit.

Make the unit equivalent to 2,000 candle-power-hours, and consumers will be more satisfied.

W. H. R.

June 25th, 1925.

[An objection to this system is that the candle-power-hours vary with the size of lamp. Only the largest gasfilled lamps approach the value stated; and over-statement is highly undesirable.—EDS., ELEC. REV.]

Lead-Covered Wiring and Visible Bonding.

As constant users of lead-covered cable we have watched, with some interest, the various shades of opinion expressed in your columns, on this form of wiring.

In reply to some of the critics who favour non-metal-covered systems, from experience we are for a metal-covered, properly bonded and earthed system every time. There is no doubt that metal is far superior to rubber, or similar material protective covering, if the bonding is done properly. The whole installation can be easily nullified by inefficient bonding, but with good-class fittings of reputable make, satisfactory bonding in the right hands becomes an easy and speedy matter.

Butler & Dickinson.

R. H. DICKINSON.

Birmingham, *June 24th*, 1925.

We have noticed in several recent issues that some of your readers seem to fight shy of this type of wiring on account of alleged troubles in bonding. We have used a well-known wiring system for many years in large quantities on the best class of work in Scotland, and could not wish for anything more simple, either in jointing or bonding.

W. C. Martin & Co.

Glasgow.

[This correspondence is now closed.—EDS. ELEC. REV.]

The Storage of Coal.

With a shadow of promised unrest either in the coal fields or the railways, engineers of power stations become wary these days and make provision by getting in ample stocks of coal.

This has to be stacked in varying heights from some 5 ft. high and where one has less room it has to be stacked perhaps 16 ft. high.

I wonder if any other engineer has discovered, as I did some years ago, that by taking a reading with a battery testing voltmeter across the vent pipes, which some engineers let down in the coal at intervals of about 12 ft., one can get a reading from 0.05 volt up to, say, 0.3 of a volt; and when its reading is high, it is time to look for combustion taking place in your coal heap.

H. W. Watts.

Cheltenham Electricity Works, *June 27th*, 1925.

Legal.

The N.S. Battery & Equipment Co., Ltd.

MR. JUSTICE RUSSELL, in the Chancery Court on June 26th, heard a motion, presented by Mr. Hecksher, for the appointment of a receiver of this company in a debenture holder's action on the ground of jeopardy.

Mr. HECKSHER said the ground of jeopardy was that the company had stopped business owing to entire lack of funds. The company was one that manufactured non-sulphating batteries. A number of ebonite containers was bought by the company at the end of last year which turned out to be faulty, and as it gave a guarantee with the battery the company was being pursued by customers to fulfil these guarantees. The water and electric light at the premises had been cut off, and the company had come to a stop. Summonses were pending and there were threats by creditors. The application was not for the appointment of a manager because there was apparently no business at the moment to manage.

Mr. MANSELL, for the company, consented to judgment.

His LORDSHIP made an order for a receiver of the company.

Comerton v. Multi-Way Earthing Clip Co., Ltd.

IN the Southwark County Court, on June 29th, Mr. E. Comerton, a commercial traveller and electrical engineer, sued the defendant company, of Old Kent Road, S.E., for the sum of £47, stated to be commission due on the sale of "Exide" batteries. Mr. WHITE, for the plaintiff, said that his client was engaged by the defendants to sell their earthing clips, on a salary of £3 per week and 5 per cent. commission on sales. In addition the plaintiff had sold a number of "Exide" batteries on which commission was also claimed. Subsequently his salary was increased to £4 per week, but the commission was stopped.

For the defence it was stated that the £1 increase was given as a temporary measure until the rate of commission on the sale of the batteries was fixed.

Judge Sir THOMAS GRAINGER held that there was an agreement for the plaintiff to receive commission. He would not, however, allow the cost of a season ticket to plaintiff. Judgment was given for plaintiff for £28 5s. and costs.

Electrical Trade of Kenya and Uganda.

THE following table, based on the recently-issued official trade returns, shows the value of the imports of electrical and allied material into Kenya and the Uganda Protectorate during the past year. The figures for 1923 have been given for purposes of comparison and notes of any increases or decreases added.

Reported New Elements.—An announcement made by Prof. Walter Nernst at the last meeting of the Prussian Academy of Science dealt with the reported discovery of two new elements by the physicist, Dr. Walter Nonnack, and Fräulein Eva Tacke, assisted by Dr. Otto Berg. The elements, which are said to have been detected by chemical analysis, and also by the Röntgen spectroscopic process, may be obtained from a number of mineral substances, of which the principal is platinum ore. Their atomic numbers are 43 and 75, and they have been named masurium and rhenium, after the East Prussian borderland and the Rhine.—*The Times.*

Published Specifications.

Compiled expressly for this journal by Patent Agents.
The name of the applicant's patent agent, if any, will be found on the printed specification.
The numbers in parentheses are those under which the specifications will be printed and abridged, and all subsequent proceedings will be taken.

1923.

30,061. "Telegraphic apparatus for the automatic reception and retransmission of electric signals." Creed & Co., Ltd., and F. G. Creed. November 29th, 1923. (234,856.)

32,582. "Electric switches." Creed & Co., Ltd., E. A. Willson, R. D. Salmon, and S. E. Kirk. December 31st, 1923. (234,860.)

1924.

165. "Electric or other drives for lathes or other machines." V. A. Pinckney. January 3rd, 1924. (234,861.)

3,155. "Electric transmission for vehicles." Tilling-Stevens Motors, Ltd., H. K. Whitehorn, and N. E. Kearley. February 6th, 1924. (234,868.)

5,158. "Apparatus for television." G. J. Blake and H. J. Spooner. February 28th, 1924. (234,882.)

5,287. "Coil plugs and coil holders for use in radio instruments." G. F. Pickett and A. North. February 29th, 1924. (234,887.)

5,438. "Automatic electric direction-indicator for motor vehicles." T. W. Bennett. March 3rd, 1924. (234,892.)

5,460. "Electric telegraph retransmitter." F. E. Pernot. March 3rd, 1924. (234,894.)

5,474. "Microphones." H. J. Round. March 3rd, 1924. (234,895.)

5,542. "Device for enclosing a record of telephone addresses or other information and readily displaying said record when required." R. G. Thomas and B. Elliott. March 4th, 1924. (234,898).

5,820. "Method of constructing thermionic valves." P. V. Castell-Evans and J. M. Longe. March 6th, 1924. (234,906.)

6,109. "Thermionic valves." W. R. Bullimore. March 10th, 1924. (Cognate application, 21,263/24.) (234,916.)

6,332. "Storage batteries." F. J. Brown. March 12th, 1924. (234,921.)

6,355. "Control of the conditions of operation of electric motor-generator sets." English Electric Co., Ltd., and J. Birrer. March 12th, 1924. (234,924.)

6,459. "Electric junction boxes and the like." G. H. Scholes, F. J. Pearce, and G. H. Scholes & Co., Ltd. March 13th, 1924. (Cognate application, 14,796/24.) (234,925.)

6,720. "Electrical synchronising apparatus." A. B. Field, T. W. Ross, and Metropolitan-Vickers Electrical Co., Ltd. March 15th, 1924. (234,936.)

6,944. "Control of electric motors." E. A. Binney and Metropolitan-Vickers Electrical Co., Ltd. March 18th, 1924. (234,938.)

6,993. "Sound-reproducing apparatus." J. G. A. Kitchen. March 19th, 1924. (Patent of addition not granted.) (234,939.)

7,810. "Indicators for electric signalling systems and the like." R. Bullough. March 27th, 1924. (234,942.)

9,433. "Battery separator plate." W. B. Stone. April 14th, 1924. (234,954.)

10,662. "Apparatus for reception of wireless signals and the like." G. W. Hale and Radio Engineering Co., Ltd. April 30th, 1924. (234,965.)

10,667. "Anodes of vacuum electric-tube devices." E. Y. Robinson, E. J. E. Hubbard, and Metropolitan-Vickers Electrical Co., Ltd. April 30th, 1924. (234,966.)

11,727. "Electric lampholders and the like." J. Stone & Co., Ltd., and A. H. Midgley. May 12th, 1924. (234,974.)

11,772. "Electric wash boilers." B. Kay. May 13th, 1924. (234,975.)

11,802. "Electrical switches and switch fuses." Midland Electric Manufacturing Co., Ltd., and W. L. Barber. May 13th, 1924. (234,976.)

12,148. "Loud-speaking telephone receivers." J. W. Hobley. May 17th, 1924. (234,980.)

12,305. "Electric condensers." T. Hough. May 20th, 1924. (234,981.)

14,036. "Regulation of electric circuits." Igranic Electric Co., Ltd. (Cutler-Hammer Manufacturing Co.). June 10th, 1924. (234,999.)

14,226. "Sparking plugs." L. S. Clarke. June 12th, 1924. (235,001.)

14,384. "Magneto-electric machines." M. L. Magneto Syndicate, Ltd., and E. A. Watson. June 13th, 1924. (235,004.)

16,949. "Telephone systems." Coventry Automatic Telephones, Ltd., and J. E. Collyer. July 15th, 1924. (235,027.)

19,380. "Rotor for electrical machines." W. Regelein, R. Sameith, and Thyssen & Co. Akt.-Ges. August 15th, 1924. (235,046.)

20,219. "Rheostats or variable resistances." Acme Production Co., Ltd., and W. D. Vick. August 27th, 1924. (235,051.)

20,265. "Inductance coils." Western Electric Co., Ltd. (Western Electric Co., Inc.). August 27th, 1924. (235,053.)

22,553. Telephone systems." Coventry Automatic Telephones, Ltd., and J. E. Collyer. September 24th, 1924. (235,064.)

23,751. "Device for measuring the apparent consumption in single and polyphase alternating-current circuits." Landis & Gyr Soc. Anon. November 9th, 1923. (224,512.)

24,255. "Incandescent cathode discharge tubes." Naamlooze Vennootschap Philips' Gloeilampenfabrieken. October 17th, 1923. (223,564.)

24,279. "Electrical switch-boxes." H. E. Kammerer. October 13th, 1924. (235,070.)

24,357. "Flat electric cables for weak-current purposes and process of manufacture thereof." Siemens & Halske Akt.-Ges., K. Bohme, and H. Schmidt. October 14th, 1924. (235,072.)

24,800. "Switch arrangement for electric flat-irons." E. Berchtold. October 18th, 1924. (235,073.)

26,911. "Incandescent lamps and similar devices." British Thomson-Houston Co., Ltd. November 12th, 1923. (224,894.)

28,763. "Contact breakers for magnetos and like ignition apparatus." Fabrica Italiana Magneti Marelli. February 7th, 1924. (228,866.)

1925.

2,229. "Advertising and like signs." A. H. Brackensey and Franco-British Electrical Co., Ltd. January 24th, 1925. (235,105.)

5,556. "Wireless receiving apparatus." Naamlooze Vennootschap Philips' Gloeilampenfabrieken. February 29th, 1924. (230,097.)

11,301. "Electro-deposition of metals." T. W. S. Hutchins. March 4th, 1924. (Addition to 197,066, divided application on 5,604/24.) (235,123.)

New Italian Magneto.—According to *Il Sole*, a meeting was held recently at the Royal Polytechnical Institute, Milan, at which the working of a new type of magneto invented by Signor Rinaldo Bassi was demonstrated. The magneto is said to be of simple and inexpensive construction and to work perfectly. A company is to be formed shortly to manufacture the new machine.—*Reuter's Trade Service* (Milan).

Electrical Developments in Russia.

THOUGH the situation in Russia continues of such a character as to excite little practical interest on the part of British traders and manufacturers who desire to co-operate in the work of electrification, it is desirable that they should keep themselves informed regarding the course of events, through our periodical publication of Russian Notes.

It is reasonable to believe that a fair volume of work is in progress and that activity is not limited to the conferences, Commissions, and other official features of the Soviet organisation. From the reports that have reached us from time to time during the last few years there is plenty of evidence of the ambitions of certain minds for electrical developments to be proceeded with on a vast scale; great plans are mooted for electricity works, for production of machinery and equipment, for co-operation between electricity supply and industrial works; large sums are suggested for expenditure on new works during specified periods, and while one may find it difficult to arrive at any clear knowledge regarding the work that is actually being done and the prospect of its efficiency or success, there is no doubt that behind the screen, or the haze, electrical progress is being made.

One of the latest reports to reach us is to the effect that the Electrification Section of the State Planning Commission has arrived at decisions on a number of points affecting the further development of the production of electrical manufactures and the reduction of their cost. The difference between the prices of foreign manufactures and those of goods made in Russia is found to be largely due to the backwardness of Russia technically, and it is considered that the "rationalisation" of the native industry is necessary in order to reduce prime costs. Under the prevailing conditions of reconstruction and of extension of output, however, such a "rationalisation" scheme in complete form cannot be realised. Therefore, it is deemed essential in the first place to limit attention to the adoption of production in bulk of single types of manufactures. It is also considered necessary for the selling prices of foreign manufactures and those of the native works to be unified in order that those of Russian products should not exceed foreign prices by more than 10 to 15 per cent., including expenses, import duties, and freights, and the State Planning Commission has asked the Committee of Internal Trade, in conjunction with the Supreme Council of National Economy and the Foreign Trade Commissariat, to draw up a scheme to this end. It is thought that the amount of the import duties, with the addition of the 10 to 15 per cent. in question, should be allotted to a special fund for disposal on a

systematic basis. Thus, the fund would be devoted to covering the losses of the Soviet works owing to the reduction in prices, to the "rationalisation" of the production of manufactures the output of which in the first place must be improved, and to the granting of credit to the Russian works so as to permit them to deliver mass production for stock. Moreover, and in order to lower the costs of production, the Electrification Section considers it necessary for the industry to be exempted from the payment of import duties on raw and semi-finished materials required for manufacturing.

The upshot of the deliberations of the Section is the appointment of a committee consisting of representatives of the State Planning Commission, the General Electrical Commission, the two electrical machine trusts, and the Electrical Bank, to prepare concrete proposals along the foregoing lines.

The immediate necessities cannot wait, however, and while the Sectional Committee was settling down to its deliberations affecting the future, the Industrial Planning Committee was approving plans for the programme of production for the six months ending next September. This programme provides for the increase of the output of electrical manufactures to 35,775,000 pre-war roubles, as compared with 27,246,000 roubles in the first half of the current fiscal year. As to the financial position of the manufacturing industry, the Commission foresees a cash deficiency of about 20,000,000 roubles in the second half of the year, which deficit it is proposed to meet by obtaining credit from the bank, instalments on sales, and by the grant of a subsidy of 6,500,000 roubles by the State, for which application has been already made.

Further reports just to hand state that a conference to discuss matters concerning the electrification of Russia was held in Moscow in the third week in June under the presidency of L. D. Trotsky. Various reports were presented and considered. In the first place it was stated that a total of 126,000,000 roubles had already been expended on works in connection with the great scheme of electrification which was approved five years ago and was estimated to involve an outlay of 2,400,000,000 roubles. This work is being continued, and large sums must be provided in the Budget estimates for the next two years. During the discussion it was pointed out that the rate of general industrial regeneration last year had a great effect upon the matter of electrical construction. Last autumn a serious danger arose that the great regional stations would be unable to find consumers, but the situation had now radically changed. The existing stations were not only fully loaded, but those which were not yet completed were assured of a full utilisation, while the question of extending the Schatur station had been raised in connection with the development of the supply system in the region of Moscow. As to the question of where and how further stations should be built, Mr. A. Goreff suggested that it was necessary to proceed in the direction of establishing combinations of generating works with industrial works as had been effected in the case of the Nischni Novgorod generating station, which had been combined with nitrogen works and paper mills. Regarding the supply of the necessary materials for electrification, representatives of the manufacturing trusts raised objections to the placing of orders in other countries. While being an advocate of the protection of national industry, Mr. Trotsky stated that protectionism must not lead towards a self-blockade. The international distribution of work must be taken into consideration. Having regard to the fact that the Russian electrical industry was behind other industries in the republic, a portion of the orders must be given abroad. The question of the concentration of the import trade in the hands of the Electrical Bank or directly in those of the trusts, was also discussed. By means of such concentration it was reckoned that it would be possible to reduce the sale prices of manufactures for groups of customers as, for instance, for rural electrification works. In this connection representatives of large customers as, for example, the Moscow (Moges) supply combination, drew attention to the inefficient execution of orders by the electrical trusts and the difficult conditions of payment, expressing themselves in favour of an extended scope of imports, confining the trusts to the bulk production of manufactures in extensive demand. On their part the trusts urged the necessity for the installation of improved equipment and organisation at their works, which could be attained through the acquisition of technical assistance from foreign works.

From the foregoing it will be observed that while a large section is in favour of the production of equipment in Russia, it is realised that at present such an ideal is unattainable. Much of the material necessary to the execution of the vast schemes which are in contemplation must be obtained from external sources.

The Wireless Telegraphy Explanation Bill.

As we have already announced, the new Wireless Telegraphy Bill introduced in the House of Commons early in this session is not to be proceeded with in its present form. But a short Bill, somewhat quaintly entitled "The Wireless Telegraphy (Explanation) Bill, 1925," has been introduced instead. Its object is stated to be to remove doubts as to the meaning of the expressions "transmission" and "rent or royalty" contained in the Wireless Telegraphy Act, 1904. "Transmission," where used in Sub-section (7) of Section 1, and in Section 2 of the Act in relation to messages, is to include and is to be deemed always to have included the reception as well as the sending of messages. And the expression "rent or royalty," where used in Section 2 of the Act of 1904 in relation to licences, is not to include, and shall be deemed never to have included fees (whether periodical or of any other kind) charged in respect of the grant or renewal of licences.

As regards the first of these "explanations," it is to be regretted that the Bill has not extended it to "messages." Is an orchestral or other piece, for instance, a message within the meaning of the Wireless Telegraphy Act and the Telegraph Acts, as a part of the monopoly of the Postmaster-General? The proviso in the 1904 Act which has been relied on by possessors of unlicensed crystal receiving sets, excludes from the definition of wireless telegraphy contained in the Act of 1904 electrical apparatus made or used "for any purpose other than the transmission (and also, according to the Bill, 'reception') of messages." What is really meant by "messages"? Section 2 of the 1904 Act, in which "reception" is also to be read as included in "transmission," refers to telegrams, including wireless telegrams, "*as within the exclusive privilege of the Postmaster-General*," and therefore clearly means messages in the strict sense of the word, and not musical or dramatic performances. Thus this interpretative amendment serves to increase the doubt raised on the construction of Sub-section (7) of Section 1. It would seem, therefore, that even if the Bill, as introduced, is passed, unlicensed broadcast listeners may still be tempted to defy the Postmaster-General. Reliance by the latter on the fact that the items in the broadcast programmes are generally preceded by an announcement, which may be regarded as a "message" to the listeners, does not seem to be of sufficient substance to settle what, after all, is a doubt of tangible importance.

The agreement between the Postmaster-General and the British Broadcasting Co., Ltd., of January 18th, 1923, to which attention was drawn in these columns on May 18th, 1923, in a special article by Mr. W. H. Stoker, K.C., seeks partially to get over the difficulty by defining "telephone" and "broadcast matter"; but as pointed out in that article, this is merely part of the terms of a licence as between the Postmaster-General and the Broadcasting Co., and does not bind the public. Nor has it, of course, the same authority as a definition in an Act of Parliament. Altogether, it is very doubtful whether this new amending Bill will achieve what is no doubt intended by it, and get over the difficulty that the Postmaster-General's privilege or monopoly is concerned with "messages" and not with "concerts."

With regard to the "explanation" of the meaning of the expression "rent or royalty," as used in the Act of 1904, which it is now stated was never intended to have included fees in respect of the grant or renewal of experimenters' licences, it has been explained unofficially in the columns of *The Times* of June 30th, 1925, that the intention of the 1904 Act was to relieve experimenters from any payment in respect of the monopoly rights of the Postmaster-General, and that this was the meaning of the use of the words "rent or royalty," and that the fees charged for experimenters' licences were to cover charges attending administration and the investigation of applications for experimental licences. It is, to say the least, doubtful whether it was really contemplated or intended by Lord Stanley, when he stated in the House of Commons in 1904 that he desired to make it *as easy as possible* for people to conduct experiments, and therefore moved to add the words: "But shall not be subject to any rent or royalty," that the Postmaster-General's Department should introduce a tax on experimenters in the guise of fees, periodical or otherwise; and the public will look on the so-called "explanation" as amendment pure and simple, due to bureaucratic administration of what was intended as an encouragement of, and not a tax on, scientific investigation—an amendment, too, which leaves the Department free to charge exorbitant fees. Altogether this new "explanatory" Bill cuts rather a sorry figure.

The Railway Centenary Celebrations.

THE celebration at Darlington and Stockton last week of the centenary of railways was as full of historic significance as of personal sentiment, and the wonderful procession of rolling stock over that little stretch of line—only a dozen miles in length—which connects the two towns named was a singular display of the progress made in locomotive engineering in a hundred years.

The chief events were reserved for Thursday (July 2nd), when the historic procession was witnessed by a quarter of a million persons; for one hour there passed in quick succession a representative collection of engines, coaches, wagons, &c., such as had never been witnessed before. It was marvellously well staged, and a triumph of organisation.

In all the display there were few features that made special appeal to the electrical engineer. In the procession there was an electric locomotive built at the Darlington works of the North-Eastern Railway in 1914 to the design of Sir Vincent L. Raven for hauling freight trains over the Shildon-Newport electrified section; this engine is fitted with four motors transmitting power through spur-gearing to wheels which have a diameter of 4 ft. Later there came along an electric passenger engine, also designed by Sir Vincent Raven, and built at the same works; it was originally intended for use on the main line of the N.E.R. between Newcastle-on-Tyne and York, the electrification of which, however, has not yet been carried out. This engine is equipped with three motors with twin armatures transmitting power through spur-gearing and quill drive to wheels which have a diameter of 6 ft. 8 in. Mention may also be made of the electric cooking installation on the latest "Flying Scotsman." The suspended scheme for the electrification between Newcastle-on-Tyne and York was an ambitious one, which may develop sectionally. On the north side of the Tyne, between Newcastle and the coast, there is a very efficient electric service forming a circular route, which serves a large population, and this system, it is contended, might well be extended to the south side of the river. Apart from traction, however, immense use is made of electricity in lighting, signalling, &c., on railways.

The Johnson and Phillips Jubilee.

So few electrical firms that were in existence 50 years ago have survived the struggle for existence, which in the early years of this century became very strenuous, that such an occasion as the attainment by Messrs. Johnson & Phillips of their jubilee is indeed a notable event, with few precedents. We commented on its approach at some length in our issue of May 15th, and showed that the prosperity of the company was on a steep up-grade, whilst the chairman of directors (one of the original founders of the firm), Mr. W. Claude Johnson, looked forward to "still more astonishing progress in store for the electrical industry." We hope, and believe, that his confidence is well founded.

In the course of the luncheon, which is reported elsewhere in this issue, some stress was laid by the chairman, Mr. J. Macgregor, on the fact that the company, though older than most electrical firms, was young in spirit; he liked "old faces," but believed in affording young blood the opportunity to make good. Certainly in the shops there was plenty of evidence that the company's products were in every way up to date, and their popularity was demonstrated by the quantity of work that was passing through the various departments, as well as by the very satisfactory report that we recently recorded, which showed that a large and increasing proportion of the output was for export trade. Clearly, with the experience of mature age and the enthusiasm and enterprise of youth combined, "J. & P." is going to maintain its position in the front rank of electrical engineering in the future as in the past, and it has our heartiest congratulations and best wishes.

Electrical Accidents.

THE annual report of H.M. Senior Inspector of Factories and Workshops, an abstract of which is commenced elsewhere in this issue, is an instructive publication of considerable value. Considering the development of the electricity supply industry that took place during the period under review, it was to be expected that the number of accidents would increase, the figure being 20 per cent. The basis on which the accidents are reportable is not, however, quite the same as that of the previous year, for it is pointed out that there is now required a disablement of more than three days, as against more than one day only in 1923. This change tends to reduce the number of reportable accidents, but owing to the incidence of the Workmen's Compensation Act in 1924, the reporting of accidents is receiving more attention than in past years. No useful deduction can be drawn from the slightly greater proportion of fatal accidents, and the remarkable fact is that so many persons meet with severe accidents from shock every year at high and extra-high pressure and yet survive, although in some cases with permanent injuries.

Although most engineers regard the divisional inspectors' suggestions and recommendations seriously and co-operate heartily, instances are recorded of the management being unsympathetic, an attitude which is past understanding, for unsatisfactory plant and conditions not infrequently necessitate the enforcement of drastic alterations which are costly and occupy a considerable amount of valuable time. Too many engineers seem to install plant for the time being without giving thought to the future; as the system grows, they find themselves in difficulties through their failure to commence the sectionalisation of switchgear in the early stages, and expensive alterations become necessary which far exceed in cost the original saving. Another point that evidently needs emphasis is the number of public supply systems which are being changed from d.c. to a.c. When the consequent alterations are made to the consumers' installations, attention should not be confined to the power circuits; neglecting to overhaul the wiring and lighting fittings is a dangerous oversight, for after many years' use with d.c. in factory premises they may be quite unsuitable for conversion to alternating current.

It is gratifying to learn that the standard of industrial illumination is being raised, and that the quality of work in factory installations generally shows a distinct improvement. Nevertheless, contractors and works electricians come in for criticism, the northern area divisional inspector remarking that many firms would save considerably and secure more reliable work by employing a qualified consulting engineer.

D

Electricity in the Chilian Nitrate Works.

The Application of Modern Methods to a Highly Conservative Industry.

By "RETAC."

THE Chilian nitrate industry is one which is not very widely known amongst engineers, but the facts that it consumes annually very large quantities of engineering material, employs, indirectly or directly, somewhere about 200,000 people, and presents some very interesting problems indeed, should render a few notes as to the manufacture of Chilian nitrate of particular interest.

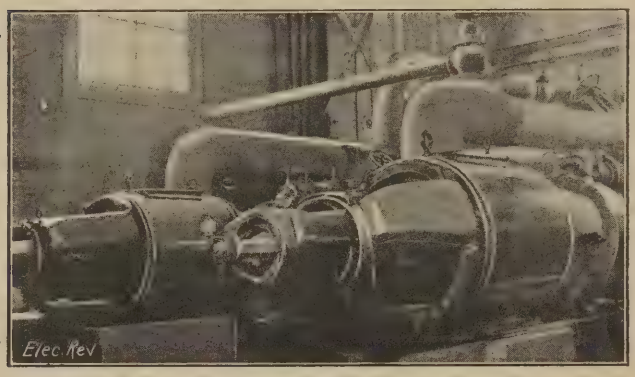

Fig. 1.—Two 300-kW Turbo-Alternators.

Chilian nitrate of soda is obtained from a crude saline material, called "Caliche," which is found in the northern deserts of Chile, between the 18 deg. S. and 26 deg. S. latitudes. The supplies of "caliche" in sight have been materially reduced by the methods of the early operators in the field, which have resulted in the "eyes" of the properties being literally picked out, numbers of them having to close down for lack of material of a sufficiently high percentage to justify their working. However, the advent of electricity has materially assisted in bringing about such large reductions in working costs that operations are being resumed, and material of a much lower percentage is now being treated at a profit. To-day, the power plant and electrical equipment of a modern nitrate oficina, *i.e.*, nitrate factory, are as up-to-date as those of any industrial concern in England, and the visitor to the Pampa may see any number of well-equipped central stations containing a.c. machinery and switchgear, and employing h.p. transmission to pumping stations, which may be anywhere up to 15 miles from the oficina.

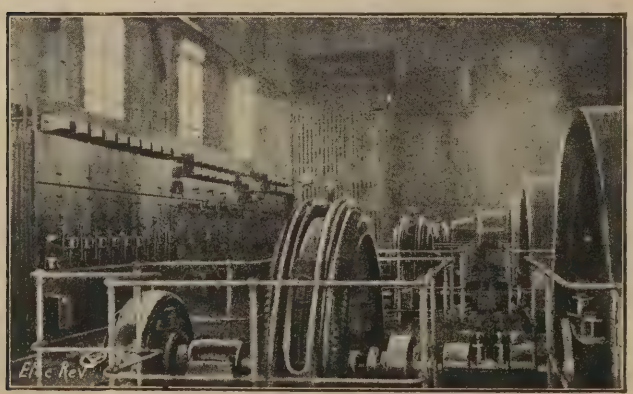

Fig. 2.—General View of Oficina Power House.

Briefly, the "Shanks" process for the extraction of nitrate of soda from "caliche," which is the system used in the majority of oficinas, consists in the deposition of nitrate crystals from a solution of the raw material. The "caliche" is placed in water in tanks and boiled up with the water to form a "caldo," or nitrate-bearing solution. This "caldo," on leaving the boiling tanks, goes, after clarifying, to open tanks or "bateas," where it is allowed to cool off, and in the process deposits nitrate crystals. The "caldo," or, as it is now called, "agua vieja," after cooling to the proper temperature, is run off from the "batea" to return *via* a settling tank to the boiling tanks to repeat the cycle, and the deposit of nitrate crystals left is dug out of the "batea" by hand, and later deposited on the drying floors to await sacking and dispatch to port. There are, of course, numerous elaborations of this treatment, and some special processes which need not be described here, as our purpose is merely to give an idea of the part played by electricity in the production of commercial nitrate of soda.

Electricity is in use right from the commencement of the operation of extracting the material from the ground to the disposal of the refuse or "ripio." Motor-driven air compressors furnish the air necessary for modern rock drilling equipment, the use of which is rapidly spreading, and is materially reducing the cost per ton of raw material extracted. We next find it in use for locomotives, which haul ore trains over considerable distances to the treatment plant, where electrically-driven crushers and conveying equipment place the material in distributing bins over or adjacent to the boiling tanks. A process such as the "Shanks" must necessarily employ a large number of pumps to deal with the liquids, and these, which may be of the centrifugal or ram type, are invariably driven by electric motor, more often than not direct coupled.

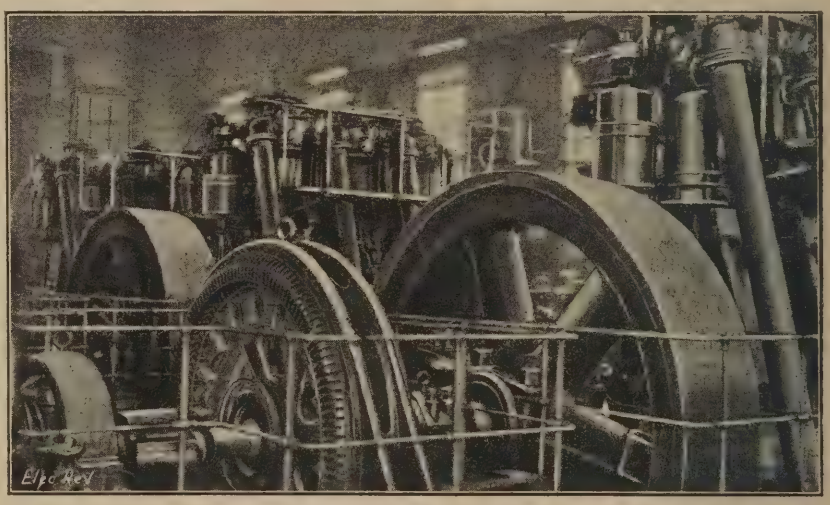

Fig. 3.—Three 180-kW Diesel Sets.

In some plants, special requirements may call for multi-speed equipments for various processes, and also the use of hydraulic power at pressures of up to 250 lb. per square inch. For the former condition a special 2-motor 3-speed push-button-controlled gear has been developed, having a small 1-speed motor for the lowest gear ratio, and a double-wound 2-speed motor for the higher speeds. The whole equipment is controlled from the operating platform by push buttons, and is so interlocked that the sequence of speeds must follow a predetermined order. This gear, however, is now being superseded by a variable speed device, giving, with a constant motor speed, any variation from zero to maximum; this enables the operator to work at the most efficient speed for the material being treated. Hydraulic

power is supplied, both by ordinary duplex pumps and by synchronous motor-driven, multi-stage turbine pumps, the motors being of the self-synchronising type. Electric winches are in use, both for the haulage of raw material to the boiling tanks, and for refuse disposal, and range from the converted steam winch to the modern specially designed gear now to be found in an up-to-date oficina. One of the chief necessities of the "Shanks" process is a supply of low-pressure steam for the boiling tank heating coils, and in bygone years this steam was generated by Lancashire boilers at from 30 to 40 lb. gauge pressure, according to requirements.

Modern practice, however, is to install water-tube boilers operating at 250 to 300 lb. pressure, and up to 250 deg. F. superheat, to supply steam to turbo-alternators, which exhaust into the boiling tank heater circuit at 30 to 40 lb. pressure. In order to obtain the best operating conditions for the turbo-alternators, it is necessary to run them as fully loaded as possible, but the condition may arise that the steam demand in the boiling tank heater circuit is lower than the full-load steam consumption of the turbine. To meet this condition, it is usual to install Diesel engine-driven alternators, which are run in parallel with the turbines, but so adjusted as to allow the turbines to take their most economical load. The heating circuit is a closed one, returning the condensed steam from the boiling tank coils to the boiler feed, but, as the natural well water is unsuitable, a large quantity of this water is withdrawn from the system daily for use in steam locomotives, boilers, and for animals and domestic purposes, and it is therefore necessary to evaporate an equivalent quantity of raw water to make up this loss. This may be done with evaporators, or, as is more usual, a battery of Lancashire boilers is used, which also serves to meet demands for steam above the capacity of the turbine plant which may be on load.

A plant, which is now in the design stage, will provide the necessary water for locomotives and domestic use by means of a condensing turbine of a suitable size drawing steam from the low-pressure steam main. A typical plant of this type consists of three 2,310 square feet heating surface oil-fired Babcock & Wilcox water-tube boilers operating at 210 lb. working pressure, and fitted with superheaters capable of heating to 100 deg. F., which supply steam to two 300-kW turbo-alternators, fig. 1, exhausting at 40 lb. gauge. The Diesel equipment consists of three 180-kW, 3-cylinder, direct-coupled sets, fig. 2. Both turbine and Diesel sets generate power at 460 volts, 60 cycles, 3-phase. Transmission of energy to the well, which is about 10 miles from the oficina, is effected at 6,600 V, the pressure being stepped up at the power house and down again at the well sub-station. In order to provide for emergencies, amongst which, of course, is fire, the well pumping station is equipped, in addition to regular 3-throw pumps, with two multi-stage, motor-driven turbine pumps which may be connected in series, and double the ordinary quantity of water may be pumped, if it is necessary. Low-pressure steam is supplied by a battery of Lancashire boilers, the low- and high-pressure steam mains being connected through a reducing valve to effect stabilisation under all conditions of load, both electrical and steam. The above plant is generating a little over 3,000,000 kWh per annum, at a cost of 0.65d. per kWh.

In some districts, advantage has been taken of water power, and small hydro-electric stations are in operation, transmitting at pressures up to 20,000 V several miles to the nitrate oficinas, and in some cases pumping tail water as well. Altogether, electricity has, without doubt, brought about a cheapening of working costs which has fairly established it as an efficient and economical means of power application, in one of the most conservative industries of the world.

A general view of a typical nitrate oficina power house is shown in fig. 3. The Diesel-driven machines are in the foreground, with the turbo-generators in the rear, and the switchboard is shown on the left.

Electro-Magnetic Sound Recording Machines.

A Wire Recorder Applicable to Radio Broadcasting.

By H. BISHOP, B.Sc., A.C.G.I.

CONSIDERABLE public interest has been created recently in the subject of electro-magnetic recording machines, which may enable a broadcasting company to give programmes of speech or music previously recorded—a development which, when it is perfected, will increase the already great interest in broadcasting.

The Telegraphone Company, of the U.S.A., and the Vox Company, of Berlin, have recently produced electro-magnetic recording machines, and their success has already indicated many uses to which they could be put.

In this article it is proposed to consider, first, the application of the Vox machine for ordinary office dictating purposes, indicating in detail the general and technical conditions involved These being understood, the wider application of the machine to broadcasting problems will follow.

The ideal dictating machine should make the dictator independent of the presence of a stenographer. It should be possible to dictate at any time, and for the work to be copied at any subsequent moment; ideally, it should be no more inconvenient or difficult to dictate to a machine than to a stenographer direct. For this reason it must be possible at any time to interrupt the dictation and to obtain the repetition of any desired part; finally (and this is important) it must be possible for any desired words or sentences to be erased, and corrections made in the appropriate places.

The invention of the phonograph offered a means whereby the spoken word could be recorded and transcribed at a later date, and, in fact, the first dictating machine placed on the market worked on the well-known Edison principle, whereby the sound vibrations of the voice are mechanically recorded on a revolving cylinder or disk of wax, the finished cylinder or disk being re-run to reproduce the speech.

It will be readily appreciated that considerable, nay, almost insuperable, difficulties lie in the way of making such a machine fulfil all the conditions set out above for an ideal machine; the last consideration especially calls for a different type of machine. The Vox Company, of Berlin, has evolved a machine which does fulfil all the conditions, but it works on an electro-magnetic principle, and it can be used equally well for dictating or for recording matter to be subsequently broadcast.

At the beginning of this century the Danish physicist, Valdemar Poulsen, conducted a series of experiments whereby he was able successfully to record speech or musical sounds on a steel wire by causing it to move past the poles of an electro-magnet, the latter being energised by a battery current, the fluctuations of which were controlled by a carbon microphone in the circuit. The fluctuations of the current, and hence the magnetism of the moving steel wire, were, of course, an electrical reproduction of the mechanical vibrations of the voice.

To reproduce the voice or music the microphone and battery in the circuit were replaced by a telephone receiver and the wire was made to move past the magnet poles a second time. The varying magnetisation of the wire passing the pole piece induced across the magnet winding varying e.m.f.'s, which (assuming the linear speed of the wire to be the same as before) produced in the telephone receiver notes of the same pitch as were previously recorded. Poulsen also found that by making the wire sufficiently hard the magnetisation given to it was retained, and therefore that reproduction could be obtained after a considerable period of time had elapsed.* The "quality" or "trueness" of the reproduction will depend chiefly on three things: (1) The uniform hardness or permeability of the steel wire throughout its length; (2) the uniformity of its cross-section; and (3) the constancy of the speed at which it is moved past the magnet, both in recording and reproduction. A variation of any one of the above factors will produce distortion, while serious variations in all three simultaneously may well cause the reproduction to be unrecognisable. Especial importance must attach to these considerations in broadcast reproduction, where a very much higher standard of "quality" is necessary than for ordinary dictating work. Poulsen's invention was put to no practical use at the time, and it can only be surmised that the practical difficulties in the way of satisfying the three conditions given above were

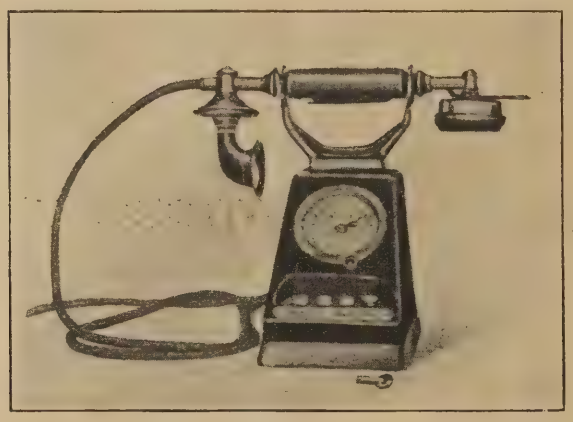

Fig. 1.—The "Speech Unit."

too great. These difficulties have now been overcome, and a machine embodying Poulsen's principle has been perfected by Dr. Stille, of the Vox Company.

As mentioned above, in an ideal dictating machine it must be possible to erase any portion of the recorded matter and substitute a correction. How can this be accomplished? If the wire on which the speech has been recorded is run past the poles of an electro-magnet, energised by d.c., before it passes the poles of that to which the telephone receiver is connected, then nothing will be heard, as the original magnetisation given to the wire will have been wiped out, and a fresh "impression" can be made by speaking into the microphone again. It will also follow that the wire can be used an infinite number of times, for, as soon as any dictation has been copied and is no longer required, the original magnetism can be wiped out by running the whole wire past the d.c. magnet. We need no new records!

The dictating machine itself is in two separate parts, which may be called the "speech unit" and the "copying unit." The first will generally be situated in the dictator's room, while the second will be in that of the typist; the two must be connected by the necessary length of multi-cored cable, which can be quite small, as no large currents are to be carried by it. The "speech unit" is essentially a remote control device for the "copying unit," containing the moving wire, the motor to drive it, and the magnet systems, &c. It consists of an ordinary desk telephone set, fig. 1, with a handset comprising a microphone and telephone earpiece mounted on the top. In front is an indicator with two pointers which revolve like the hands of a clock, showing whether the steel recording wire is moving, and its exact position. At the base there are four buttons: The first three, controlling the motor, are labelled "Forward," "Stop," and "Backward"; while the fourth, labelled "Call," is an alarm to draw the attention of the typist who may actually be copying at the moment when it is desired to give further dictation. There is, further, a "Press to speak" switch on the handset which connects the microphone in series with a battery to the recording magnet, and at the same time switches a battery on to the erasing magnet which the moving wire passes before it reaches the former. Thus, previously recorded dictation is automatically erased before a further record is made. The releasing of this switch also connects

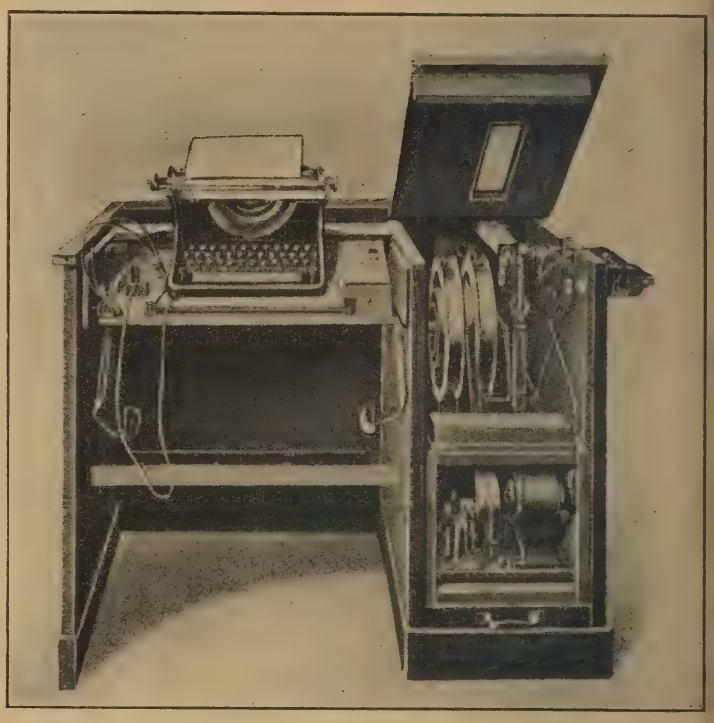

Fig. 2.—The "Vox" Dictating Machine, or "Copying Unit."

directly to the recording magnet winding the telephone earpiece of the handset, instead of the microphone and battery. It follows, therefore, that the "Press to speak" switch must not be closed if the moving wire is being run through with the object of listening to a previously dictated letter.

The "copying unit," the construction of which can be seen from fig. 2, consists of a desk with room for a typewriter and position for the stenographer on the left, the "recorder" itself being built in on the right. This is composed of two large pulleys which, together, hold the moving wire—some six miles of hard steel wire 0.25 mm. in diameter—and are driven by an electric motor. The wire runs from one pulley between the poles of the erasing and recording magnets round a small pulley at the back and then on to the second large pulley. As the wire has to be run back before it is possible to listen to a dictation, switching is incorporated for cutting in and out a resistance so that the wire runs backwards much faster than forwards, and thus time is saved.

In addition, the desk contains various relays for remotely controlling the motor, the drive to the pulleys with its gearing, and also small dry batteries and accumulators for the microphone, alarm bell, and relays. There is, further, an indicator which shows the position of the wire and runs synchronously with that on the "speech unit." To the immediate right of the typewriter is a small switch box, which provides for the local control of the machine, and is similar to that provided on the "speech unit." When the machine is in use, and the dictator presses the "Call" button, a signal will be heard by the typist, who can stop and.

* Full descriptions of the Poulsen "Telegraphone" were published in the ELECTRICAL REVIEW of April 27th and October 12th 1900, and May 10th, 1901.—EDS.

by operating a switch, bring the remote control into action for fresh dictation. There is one extra button on this control unit, labelled "Repeat," which is used as follows: Foot controls for "Stop" and "Start" are provided in parallel with the respective push buttons so that the typist's hands are free, and, when copying, a few words would be listened to, the machine stopped and those words typed; the machine would then be started again and more listened to, and so on. Moreover, if the "Repeat" button is pressed, each time the machine is started the last word of the previous group will be repeated, thus rendering it impossible to miss a word. The telephone receivers provided are worn on a headband as are ordinary headphones for "wireless" reception.

Briefly, the method of using this machine for dictation is as follows: The dictator takes up his hand-set and presses the "Call" button. If the stenographer is copying at the time, the call will be heard in the headphones, copying will be suspended, and the wire run through to a position where it can be used, the signal to start being given with the "Call" button. The dictator then presses his "Forward" button, and will see by the small hand of his indicator that the machine is running, and by the large one (which runs more slowly) where his dictation will start on the wire; later, of course, it will indicate the finish. The stenographer can also note the start and finish by the indicator on the "copying unit," and thus will know where the wire must be started to copy each piece of dictation.

The dictator next presses the "Press to speak" switch on his hand-set and speaks his dictation into the microphone. If he wishes to pause it is only necessary to press the "Stop" button, when the motor will stop; to start again the "Forward" button is pressed, and the dictator can proceed. If a repeat is desired, the "Press to speak" switch must be released and the "Backward" button pressed, when the wire will run back quickly until it is stopped by pressing the "Forward" button at the desired point, shown by the indicator pointers, when the wire will move forward again and repeat the already dictated portion. If a mistake is discovered, it is only necessary to run the wire back past the point and set it going forward again; then, at the appropriate moment, to press the "Press to speak" switch and speak the correction into the microphone. At this instant the errors will be erased and the correction recorded on the wire.

Here it may be mentioned that the six miles of wire provided takes about an hour to run through, so that dictation of considerable length can be undertaken. The dictation is concluded by pressing the "Stop" button, and placing the hand-set on the rest.

At the "copying unit" end the indicator will show how dictation is proceeding. The stenographer, wearing the head telephones, operates the machine for copying as follows: The switch is put over to "copying unit" and the wire run back (by pressing the "Backward" button) until the desired place is reached, further control of the machine being by the two foot pedals—that on the right starting the wire and that on the left stopping it. When the copying is completed the stenographer has only to run the wire back to prepare the machine for further use.

There are no "records" to change, the same steel wire being always available. Power for the motor is obtainable from the mains, while the dry batteries, &c., will last several months. The upkeep costs are therefore negligible, and it will be apparent that by a simple exchange system one copying unit could be installed in the stenographer's office, while a "speech unit" might be provided in each of several offices, thus permitting the use of the machine by several members of the staff—in each case from their own offices. Such facilities are not provided by the standard model.

Having dealt in detail with the dictating machine *per se*, we may now turn to its application to the purposes of broadcasting. It will be realised that its uses are manifold: First, an actual broadcast programme can be recorded and reproduced at a later date. This may be either a concert or some event of national importance, such as the opening ceremony at Wembley. This could be done either by the broadcasting authority, in which case the performance could be broadcast again, or by the listener, in which case he only could repeat it through his own loud speaker or headphones.

Secondly, it will enable a programme given in one place to be recorded and re-transmitted from another place, the wire containing the record being dispatched like a kinematograph film. In this way programmes could be exchanged internationally, and British listeners could be given an American programme without the almost invariable accompaniment of fading and atmospherics to which "wireless" relaying is subject! Thirdly, the recording machine provides a simple method of confidential transmission, which may be accomplished by recording the message on the steel wire. Transmission is then effected by reversing the travel of the wire, the message thus being rendered wholly unintelligible, until, at the receiving end, the message is recorded on a similar machine and the necessary reversal carried out.

The recorder already described requires several modifications to adapt it to broadcasting purposes. The remote control unit can be dispensed with and the so-called "copying unit" installed in the control room of the broadcasting station. The ordinary carbon microphone would be replaced by the studio microphone equipment for recording local programmes, or by a "wireless" receiver, or telephone line for recording those of a distant station. The steel wire must be capable of removal from the machine, and as it has to be carefully handled if it is to preserve the record, it should be removable without detachment from its spools. For re-broadcasting a previously recorded programme the recording magnet winding would be connected through amplifiers to the "wireless" transmitter, which would replace the headphones.

The Vox Company has also produced a smaller machine, which, while it can be used as a dictating machine, has provision for application to broadcasting purposes as outlined above. A smaller amount of wire is provided, and the two spools are mounted so that they can be removed instantly with their bearings, &c.—in fact, the operation of changing wires is as simple as that of changing a gramophone record. Further, as soon as the spools are removed from the machine with their carrier they are automatically locked, so that it is impossible for the wire to unwind and get kinked.

The writer recently had the experience of hearing a demonstration of these machines for purposes of both dictating and broadcasting. The reproduction of speech was excellent, but that of music left something to be desired. The latter, of course, requires a much higher standard of perfection, but further experimental work, which is still in progress, will doubtless result in this standard being attained. It is hoped that the time is not far distant when British listeners may have the opportunity of testing the success of reproduction by these electro-magnetic machines.

The author desires to express his thanks to the Vox Company, of Berlin, for its courtesy in allowing the publication of the accompanying illustrations and for supplying information regarding the machines.

City of Winnipeg's New Steam-driven Plant.—Tests on the plant of the new steam-driven electricity generating station at Winnipeg, which serves as a stand-by to the city of Winnipeg hydro-electric system, were recently carried out under the supervision of Professor N. M. Hall, of the Manitoba University. This new up-to-date station has three boilers fired with pulverised coal installed by Combustion Engineering, Limited, and two electrically-heated boilers installed by the Canadian General Electric Co., Ltd. The engine-room contains two 5,000-kW turbines, and one of 1,000 kW, all running at a speed of 3,600 r.p.m., manufactured by James Howden & Co., Glasgow. These turbines are coupled to Parsons alternators, and are supplied with steam at 220 lb. and 150 deg. F. superheat. The larger turbines exhaust into Hick, Hargreaves condensers, and the 1,000-kW set is a back pressure unit and exhausts into the hotwell. Each day all three turbines are run up to speed to ensure that everything is in order, and once each week they are put on the line. The boilers supply the central steam heating system of the city, and sufficient steam is always available to meet a sudden call for the stand-by plant.

The International E.H.P. Conference.

By R. BORLASE MATTHEWS, Wh.Ex., A.M.Inst.C.E., M.I.E.E., F.R.Ae.S.

(*Concluded from p. 7.*)

In the second part of Group (I) of the papers read at this Conference the following were the more interesting features:—

Insulating Oils.—An excellent review of the research work carried out in Great Britain was given by Mr. A. R. Everest. Incidentally he mentioned that rheostat oil required a very high flash point, and further that oil for electrolytic arresters must be free from any tendency to emulsify with the electrolyte. The discussions on the subject generally were rather disappointing, as they tended to hark back to old ground rather than to venture into new pastures. However, it is work that the I.E.C. has well in hand.

Outdoor Sub-stations.—France has now no fewer than 89 open-air equipments on a fairly large scale. Mr. Planteau gave an excellent *résumé* of progress made during the last two years, illustrated with the ingenious coloured stereoscopic views to which reference has already been made. Some very interesting modern bus-bar arrangements were described.

Test Pressures.—This is again a somewhat hackneyed subject, which nevertheless always arouses considerable discussion. Still no progress was made. It was decided to transmit a report of the discussion to the I.E.C.

Ironclad Switchgear.—Two most interesting papers were read by Messrs. R. W. Gregory and H. W. Clothier (the latter illustrated with a kinematograph film). Both contained matter that was novel to most Continental engineers, and were admirable expositions of modern practice. Further, both papers were well illustrated.

Group (II) of the papers presented dealt with the following matters, under the general heading of the construction and insulation of transmission lines: line construction generally; posts; insulators; cables and conductors; and the prevention of damage to electrical installations by earthquake. This last item was of a most novel and interesting nature, for detailed particulars were given in a paper of 118 pages of the damage caused to Japanese installations by the recent terrible convulsions. Though one and a half million electric lamps were destroyed, 900 electric tramcars burned by fire, and several tens of thousands of kilowatts of plant put out of commission, in five months the demand for electricity had recovered to that of pre-earthquake days. As the result of a careful analysis of the damage done, new rules have been drawn up, which it is hoped will greatly mitigate any adverse results of future earthquakes to electrical installations.

In this particular group it was disappointing that Great Britain did not present any papers that supported an industry in which she is far ahead of other nations, *viz.*, cable manufacture. The stock arguments that there is nothing very new in cable design, and that everyone knows that England makes the best cables, are not good enough. Foreign engineers are becoming very interested in the subject, but fear to use cables as much as they might, owing to lack of experience in laying and maintaining them, &c. Their views on the earthing of the neutral, protective apparatus, and the like, as disclosed by the discussions, are much behind British practice. It is to be hoped that this important section of British industry will be well represented on another occasion.

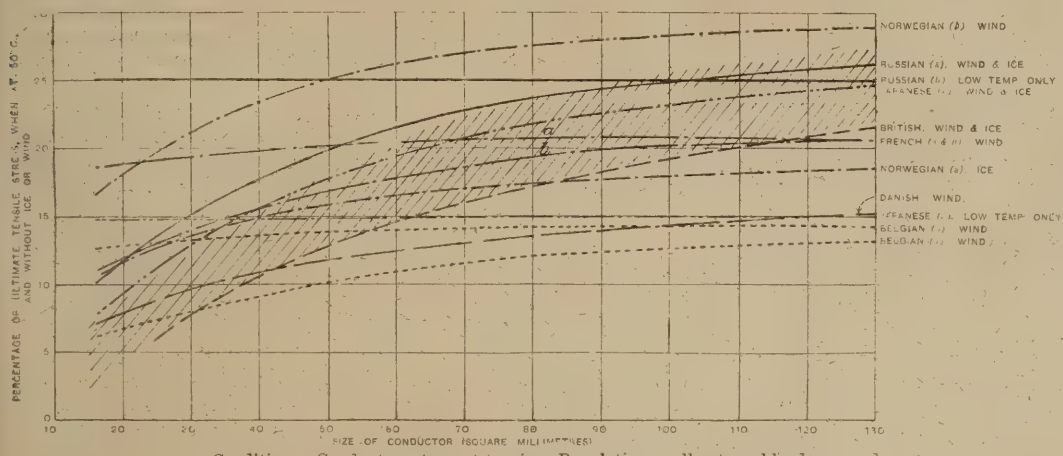
Overhead Lines.—Very often approximate data are required for a preliminary idea as to the type of overhead line that should be employed. Some very useful notes in this connection were given in a paper by Mr. E. V. Pannell. The Italian delegation, through Mr. L. Maggi, presented a very useful report upon the practice of that country in overhead e.h.p. line construction, including wide river crossings. Though there is insufficient space to deal here with the general subject as discussed at the Conference, it may be well to draw attention to the very great progress that is being made. It is far greater than many British engineers—unaccustomed to this class of work—are apt to think.

Poles.—Of particular interest were the papers on concrete pole construction. According to Mr. P. Ferrier, concrete poles are economical for lengths less than 60 feet or over 80 feet (steel towers being cheaper for lengths of from 60 to 80 ft.). The centrifugal process of constructing ferro-concrete poles was described by Mr. C. Montagni. This process is carried out in revolving moulds, which cause a previously prepared conical reinforcement to be covered with a homogeneous layer of concrete, both externally and internally. In this way the reinforcement is properly centred.

Insulators.—Mr. A. O. Austin drew attention to the fact that there are now two main schools of thought as regards dealing with electrical flashes-over on overhead lines. The one believes that it is impossible to prevent them, and therefore that attention should be concentrated on controlling the path of the power arc to the ground. The other school considers that electrical flashes-over can be prevented by raising the flash-over voltage of the system. This seems reasonable, as losses increase very rapidly with voltage, so that a slight rise in the flash-over voltage of the system may cause surges to be dissipated without reaching a voltage sufficient to strike an arc to ground. For some years past the insulator has been considered to be the chief source of trouble on a transmission line. To-day it appears as if the conductor is likely to cause more trouble than the insulators. The method of employing insulated controls at the conductor end of link suspensions was described in this paper. These controls merely consist of a bowed arm, the external ends of which embrace, but do not touch, the last insulator of the suspended chain. This method has given excellent results on the lines of the Consumers' Power Co., Jackson, Michigan; the Illinois Power Co.; and the Penn Public Service Corporation.

Cables.—Mr. L. Emanueli described the 130,000-volt three-phase cable recently laid in Italy. It is laid as three single cables, each 600 metres long (with two joints in each length). The cables are hollow, and insulating oil is placed in the interior, expansion chambers being provided at the ends. This development is looked upon as of importance, as it will enable e.h.p. lines to be carried by cable through congested areas.

Group (III) of the papers—the development of the transmission system—covered the effect of earthing the neutral of transmission systems on telephone and telegraph lines; telephonic communication between power stations; surcharges, surges, atmospheric and other transitory phenomena in connection with high-pressure lines; measurement of energy and losses; power factor; standardisation of pressures; regulations for high-pressure lines; accidents and breakdowns; rural distribution and electro-farming.



Télécommunication is the joint French word that refers to both telephony and telegraphy. It is a word that is missing, though needed, in the English language. The general tenor of the discussion was that all difficulties that had arisen so far could be overcome. The chief difficulty was the cost. It appeared that the Governments of most countries were co-operating with, rather than laying down regulations for, the providers of electricity to ascertain the most economical solutions.

The klydonograph was the name of a newly developed instrument, described by Mr. Peters, and employed for measuring abnormal voltages of a transitory nature on transmission systems. It consists of a clockwork-operated photographic film (so as to obtain records over a week) in contact with which are discharge points.

On development of the film, figures appear that give pertinent information concerning the nature of the voltage impressed. This device has already proved its merits in operation.*

Statistics on Accidents.—A very detailed report was presented by the I.M.E.A., in reply to a request circulated by the Council of the Conference, asking for information on this point. Apparently the majority of short-circuits are due to vermin and workmen's picks. Similar reports were also presented by the Dutch and the Swiss. While these escape the troubles due to workmen's picks, in their stead they have to contend with the troubles of thunderstorms.

Regulations for Overhead Lines.—Five countries reported upon this subject. A most interesting summary of the practice in many countries was given by Mr. G. V. Twiss. This paper was accompanied by a diagram, which is reproduced herewith. A similar paper was presented to the I.E.C. conference at The Hague (see ELECTRICAL REVIEW, p. 727, May, 1925).

Conditions: Conductors strung to various Regulations; all external load removed, and temperature raised to 50° C; span, 150 metres.

Curves showing Stress remaining in Stranded Copper Conductors.

From this chart it will be observed that the graphs tend to fall into two groups, (*a*) rectilinear, and (*b*) hyperbolic. Of these the British I.E.C. Committee appears to consider that the hyperbolic curve is the one that most closely represents the conditions required to meet practical working needs. The reason for this is that this curve takes into account the observed tendency of smaller lines to fail when erected to the equivalent loadings of the larger ones, whilst at the same time it also eliminates excessive precaution in the case of the larger sizes of conductors. A shaded band or zone is indicated on the figure. The idea of this is to represent arbitrarily by the lower boundary of the zone the loadings sufficient to safeguard lines under severe climatic conditions; on the other hand, the loadings indicated by the upper boundary correspond to the conditions occurring in countries with equable climates. The formula calculated for these loadings is:—

$$A = M\,(2.25 \times .052\,D^{1.35})$$

where A = added load in kg./m length,
D = overall diameter of conductor in mm.,
and M = a constant dependent upon the climatic conditions.

Electro-Farming.—Two papers were presented on this subject, one, by M. Fukuda, describing the progress that was being made in Japan in this direction. Some very interesting comparative figures were given as to the relative costs of the use of electricity, steam, and oil engines on the farm. Considerable attention is given to irrigation in Japan. Novel uses of irrigation water are for destroying (*a*) obnoxious insects, (*b*) destructive worms, and (*c*) weeds. The other paper, by the present writer, dealt with the lay-out problem for rural e.h.p. lines. Attention was particularly drawn to the fact that rural line calculations should always be based upon miles or kilometres of route, instead of upon the area of supply—as is usually done by those antagonistic to the idea. It was pointed out that there was now ample evidence that when rural areas, with at least one-third of the land under the plough, were handled properly they were remunerative. This paper was illustrated with a kinematograph film to demonstrate the possibilities of using electricity on the farm. To illustrate one method of educating farmers, a propaganda magazine, now issued in England, was distributed.

In Conclusion.—The next Conference is to be held in 1927, at Paris. A full report of the proceedings will be published in French in the autumn. It will be published in English if only 1,000 copies are ordered.

A resolution was passed at the final proceedings asking each country to form a special committee—as was done in Great Britain last year—to make the necessary preparations for representing each nation's work in an adequate manner.

Dr. C. O. Mailloux (U.S.A.) was charged with the preparation of a report upon the economy of the use of various fuels by various nations, ready for the next Conference. Mr. Norberg Schulz (Norway) is to form a committee for establishing in every country a uniform basis for statistics concerning the production, transmission, and distribution of electrical energy and the economics thereof. Questions relating to insulating oils and test pressures were referred to the I.E.C. Insulators are also to receive special attention at the next Conference.

The proceedings terminated with a special vote of thanks to the President of France (M. Doumergue) for the very kind way in which he had shown his interest in the distribution of electricity.

*For a description of the instrument see ELECTRICAL REVIEW, May 9th, 1924, p. 770.

The First International Congress of Radiology.

AN International Congress of Radiology was held at the Central Hall, Westminster, from June 30th to July 4th. It was organised by the three radiological societies of Great Britain, namely, the Roentgen Society, the Electro-Therapeutic Section of the Royal Society of Medicine, and the British Institute of Radiology. The President of the Congress was Mr. C. Thurstan Holland, and it was decided to constitute it the first of a series of triennial Congresses.

The official opening by the Duke of Connaught took place in the afternoon of Wednesday, July 1st, but actually the various sections of the Congress had started work in the morning. There were some 500 delegates from all over the world, and in connection with the Congress, an exhibition of radiological apparatus was held.

The DUKE OF CONNAUGHT, before declaring the Congress open, recalled that it was just over 30 years since Roentgen discovered X-rays, and said it was an eloquent tribute to his discovery that in the year 1925 such a large body of scientists and medical men should meet to discuss the many directions in which the science of radiology had developed. In addition to the value of X-rays in fighting disease, their use for the detection of faults in steel was an established procedure, whilst X-rays were also used for the detection of faults in wood used for the construction of aeroplanes, for determining the structure of coal, &c. One of the most recent developments was the step taken by the British Red Cross Society in the use of mobile X-ray units which could be taken to villages and out-of-the-way places for the treatment of persons who would otherwise not be able to obtain it, and such was the perfection which had been reached, that these portable X-ray units were as good as many of the permanent ones in the large hospitals. After a reference to the objects and aims of the recently formed British Institute of Radiology, His Royal Highness spoke of the use of radium in conjunction with X-rays in the treatment of malignant disease, and with reference to the Ministry of Health's inquiry into the treatment of cancer by this means, expressed the hope that the outcome would be sufficiently encouraging to warrant further large supplies of radium being placed at the disposal of the medical profession.

Mr. NEVILLE CHAMBERLAIN, Minister of Health, who welcomed the delegates on behalf of the Government, also referred to the inquiry into the treatment of cancer, and spoke of the scarcity and high cost of radium, sufficient quantities of which under present circumstances were hard to find.

The Congress was divided into several sections, and we commence below a short account of the items of special interest to our readers.

International Units and Standards.

The whole of Wednesday, July 1st, was devoted by Section I (Physics), and Section III (Radiology), to a discussion upon international units and standards for X-ray work.

SIR WILLIAM BRAGG, F.R.S., who opened this discussion, said the problem of arriving at international units and standards for X-ray work was beset with more difficulties perhaps than was the choice of any other unit which science had ever had to devise. There were the difference between quantity and quality, the difference between the amount of energy and the wave-length which carried it, and the continual difficulty of the scattering of the X-rays and the formation of other beams which had to be taken into account. In Germany a Congress had been held at which definite resolutions had been passed as to the best means to be adopted. In England also there was a Standing Committee formed by the Physical Society and the Roentgen Society which had been considering the question, but the work done only served to emphasise how complex a question this was. The whole thing was a matter of compromise, and looking at it broadly there were three things to be considered. First of all, there was the determination of the scientific unit; secondly, there was the determination of a standard piece of apparatus which could be used for comparison, and, thirdly, there was the comparison of the results obtained under treatment with the standard. The first two were largely matters for physicists, whilst the third was entirely a hospital matter. It was no use, however, carrying any one of these three questions to completion and leaving the others in a state of incompleteness or indefiniteness. All three must be attacked together.

Mr. A. BECLERE (France) expressed the hope that an endeavour would be made to find a physical unit for dosage which would be recognised and adopted by all radiologists in all countries rather than a biological unit. Perhaps the best course to adopt would be for the Congress to constitute an International Committee for the study of this very important question.

Dr. I. SOLOMON (France) suggested that the ionometric method constituted the best for the measurement of Roentgen rays and expressed the view that the Behnken unit adopted in Germany, although satisfactory in many respects, had certain difficulties of technique which were likely to prevent its general adoption. He preferred the notation in R units which he had devised and which had been used in France for four years.

Prof. H. MARTIUS and Prof. L. GREBE (Bonn, Germany) spoke of the difficulties introduced by secondary radiations in endeavouring to arrive at standards for international units, and referred to experiments which showed that the scattered radiation might be many hundreds per cent. in excess of the primary radiation.

Dr. W. ALTSCHUL (Prague) urged the necessity for standards which would enable a dosimeter to indicate at any moment of the radiation, the actual dose which was being given.

Dr. J. H. SHAXBY (Cardiff), speaking on behalf of Dr. A. Dauvillier, of France, described apparatus for standardising dosimeters, and urged the adoption of physical units in arriving at standards rather than biological units.

Dr. N. S. FINZI (London) seconded the proposal of Dr. Béclère for the appointment of an International Committee to determine the unit of X-ray dosage. One of the first things which it would have to determine was whether a physical or a biological unit should be adopted. The best method in the general interests should be adopted and no questions of priority of work on the problem in any particular country should hamper a decision.

The proposal was carried unanimously, and the Chairman promised to bring the matter before the general meeting of the delegates later.

Dr. H. MOORE (London) said that it would be an important step towards a solution of the problem of measuring X-rays if radiologists were provided with generating apparatus with which they could, at any time they chose, obtain an X-ray beam of definite quality. Suppose, for example, they could have a battery of cells giving 200,000 volts and could connect that across an X-ray tube and could pass through that tube 10 milliamperes, they would be fairly certain of getting the same type of X-rays from that tube one day after another. The important thing was to get a constant voltage. Therefore, he suggested what was perhaps rather revolutionary, namely, that radiologists should scrap their present apparatus and install as rapidly as possible constant-voltage apparatus. The only thing required was the money, because such sets were on the market. A voltmeter which could be depended upon should be used. With such apparatus as he had suggested in common use throughout the world, a mass of information could be accumulated which would be of enormous use for comparative purposes and would assist the adoption of international standards.

(To be continued.)

A Visit to Messrs. Johnson and Phillips's Works.

A Jubilee Celebration.

ON Friday last, to mark the completion of half a century's continuous activity in connection with electrical engineering, the firm of Johnson & Phillips, Ltd., entertained a large party of journalists to luncheon at its works at Carlton, and afterwards conducted the guests through the various departments of the factory, which has grown up round the original workshop that was built in 1875 to manufacture telegraph cable and accessories. The products of the company now include cable-handling machinery for cable steamships; cables for electric lighting and power and for telephony, of numerous varieties; cable-making machinery, transformers, switchgear, instruments, and overhead line equipment, and from the appearance of the workshops it was evident that an abundance of work was passing through them.

At the luncheon Mr. J. Macgregor, managing director, occupied the chair, supported by Sir Philip Dawson, K.B.E., M.P., Mr. H. J. Sheppard, Mr. C. Stewart, and other members of the directorate and staff.

After the toast of "The King" had been honoured, SIR PHILIP DAWSON proposed "The Press," to which he admitted he had himself been a contributor on many occasions. From his experience in various countries, he declared that there was no fairer or more honest Press than that of this country, and his political career had taught him that it exercised the greatest possible influence. Coupling the toast with the name of Mr. E. A. Gatehouse, Sir Philip said that his father, the late Mr. Tom E. Gatehouse, was one of his dearest friends, and introduced him to journalism many years ago.

Responding, Mr. GATEHOUSE recalled the good advice Sir Philip gave him when he left college and was about to start practical work—to enter an engineering workshop. The firm of Johnson & Phillips had been associated with the ELECTRICAL REVIEW for nearly the whole of its 50 years' existence; it was a privilege which the Press appreciated to take part in the celebration of such a jubilee, which was especially noteworthy at a time when industrial difficulties were rife. The prosperity of the firm bore witness to the foresight and determination of the men in charge of its destinies. On behalf of the Press he cordially congratulated the directors and staff, and wished them the greatest possible success in the future.

Mr. J. W. BEAUCHAMP, director of E.D.A., proposing the health of "The Firm," remarked that few electrical concerns had yet celebrated their jubilee. Thirty years ago the company was producing everything required by an electricity supply undertaking; he had had experience of the quality of its products at Tunbridge Wells, and found them all very good. Now the company had concentrated upon the production of everything essential to transmission and distribution. It was not yet fully realised that the distribution problem was every year increasing in importance; the cost of distribution must be reduced, and they must get more units through every thousand pounds' worth of plant. Immense quantities of copper were being put underground: they must get a higher duty out of that copper. Upon success in that direction the cheapness and abundance of electricity supply depended even more than on economies effected in the power station. A tour of such a factory as that of Messrs. Johnson and Phillips was of great educational value.

Mr. MACGREGOR, responding to the toast, said that 50 years ago they could not have looked forward to such a gathering; it had been a hard struggle for all electrical firms. He believed in old faces—but they must have young blood, and the success of the firm was largely due to its having always been ready to give young men a chance to make good. The firm was founded by Mr. W. Claude Johnson and Mr. S. Phillips, and was made a limited company in 1905. The period from 1904 to 1908 was a very bad time, but they weathered the storm, and to-day they were fairly satisfied with the success they had attained. He knew it paid to advertise; in the early days the Press was rather dependent on the manufacturers for support, but now they could rely on the support of the Press—it was sometimes critical, but always with goodwill. He could tell them a good deal about their first Gramme dynamo, their first arc lamp, their first cable, for they were pioneers. Fortunately the keen competition formerly met with in this country had been broken down, allowing them to make a little profit which could be devoted to research and enabled them to keep up to date, as would be seen in the shops.

A lengthy tour of inspection of the shops then took place, ending with a visit to the test room, where tests were carried out on cables at pressures up to 190,000 volts, without breakdown. The test-room equipment for the accurate measurement of dielectric losses in high-pressure cables, and for the determination of cross-talk and capacity in telephone cables, was especially interesting.

Electricity in Factories and Workshops.

H.M. Electrical Inspector's Annual Report.

THE annual report of the (Home Office) Chief Inspector of Factories and Workshops for the year 1924 has just been issued.* Chapter IV, which is devoted to the report of the senior electrical inspector, Mr. G. Scott Ram, M.I.E.E., is abstracted below: It is pointed out that at no time since electrical stations first became "factories" in 1902 has the development of the electricity supply industry been so active. The number of transforming and distributing sub-stations is greatly increasing, and they are generally satisfactory; cases have, however, been found where the work has been entrusted to contractors new to this class of work, who have obtained it by quoting very low prices, and serious mistakes have been made involving grave risks to the persons who subsequently have to operate and maintain the plant.

The divisional electrical inspectors have been very active during the year, and their reports are of much interest and value, but it is impossible to quote more than a few very brief extracts. Mr. Swann (southern area), in dealing with various supply undertakings, refers to some which, being originally of small importance, have relied on being able to shut down for cleaning or other work on the switchboards, but now find themselves in difficulties through failure to commence sectionalisation of switchgear in the early stages, it being now a difficult and expensive matter to deal with. He refers also to the varying attitudes adopted by engineers of different undertakings; some co-operated heartily, and considerable improvement has been effected, but in other cases the management is not sympathetic.

In two large works being erected for a new industry by Continental firms, the open type switchgear was hopelessly mixed up with the factory process plant and otherwise contrary to the regulations, necessitating very considerable alterations. Special attention has been paid to various brickyards recently electrified, and Mr. Swann has been able to secure that the lighting pressure shall not exceed 110 volts alternating for the numerous portable lamps used at the kilns under very trying conditions of rough usage, exposure to weather and heat.

In electric lamp and radio valve works, where very high pressures are used, he has been able to obtain extensive and far-reaching precautions to suit the particular processes without interfering with output. At the request of the directorate of the British Empire Exhibition, a good deal of inspection work was carried out at Wembley in connection with the electrical exhibits.

Mr. McColgan, after describing large extensions of public supply in the northern area, refers to the excessively rough usage to which electrical plant is put in such places as steel works by reason of the unskilled labour employed. Master controllers and contactors could with advantage be utilised for controlling other than large mill motors, thereby taking out of the hands of the unskilled operator the sequence and speed of operation. In some of the steel works engineering and shipyards, the system of maintenance is very good, but in others the tendency appears to be to wait until apparatus actually breaks down. False economy in electrical staffs whereby the staff cannot possibly carry out all the work expected from it, is responsible for some of these deficiencies. Fuses which do not comply with the regulations are still very numerous and responsible for accidents. There is undoubtedly an extensive field for a small type of circuit-breaker at a competitive price, as a substitute for the larger fuses.

It frequently occurs in factory installations that the occupier leaves his electrical arrangements to a contractor, and is surprised to learn after inspection that he has a very third-rate job that is not in order. In certain cases Mr. McColgan interviewed the contractors, whom he found to be entirely ignorant of the regulations. Similar observations apply sometimes to works' electricians who are responsible for much bad and dangerous work. An installation to comply fully with the regulations, if properly thought out, should cost little if anything more than one in which there may be many irregularities. Much apparatus, not in compliance, is installed through ignorance and many firms would save considerably by employing an experienced consulting engineer.

Mr. Brown (North of England area) reports that electric driving is making rapid progress in the woollen and worsted industry, more so than in the cotton industry, and great improvements are taking place in the standard of industrial lighting. In some installations the illumination has been increased several-fold with very little increase in the energy consumption, and unexpected results are sometimes found, showing that efficient lighting of the work is not the only aspect to be considered.

Whilst a distinct improvement is noticeable in the quality of work in factory installations generally, some recent installations demonstrate a deplorable lack of engineering knowledge and of the requirements of the regulations. There is still a tendency for small contractors to use light gauge close-joint conduit and grip fittings for large power installations, for which they are quite unfitted; cleat wiring well installed, with the conductors protected where liable to damage, is far preferable to a cheap conduit system. Faulty designs of apparatus are still turned out by some manufacturers, *e.g.*, star-delta starters with fuses so placed that the whole of the live parts have to be exposed in order to get at the fuses, and switch lampholders having live switch spindles. Many contractors do not realise the necessity for placing single-pole switches in the live wire on systems where one pole is earthed, and some supply authorities are also very lax on this point.

The accidents reported during the year numbered 433, including 27 fatal cases, compared with 361 and 21 fatal cases in 1923. The proportion of fatal accidents is slightly greater. Of 37 accidents on high-pressure or extra-high-pressure systems only six were fatal. (Twenty-three of them, three fatal, occurred on public supply systems to employés of the supply undertakings.)

One of the most fruitful sources of serious accidents (96 cases, 21 on h.p.), is that of persons working on live switchboards or other apparatus, thinking that the conductors were dead; some cases are quite inexcusable. Many accidents on h.p. apparatus are due to mistakes which could be avoided by the rigid observance of a rule to test all conductors, even if "known" to be dead, and then earthing them.

The next largest class of accidents concerns the use of portable apparatus in which there were 72 accidents, all at low pressure. In 48, or two-thirds of them, the injuries were burns from short circuits, and in the other 24, including 5 fatal cases, the injuries were from shock. Half of this class was due to the use of poor quality or worn-out flexible; a dozen occurred at electric irons, due to short circuit at the point where the wires leave the iron close to the operator's hand.

Thirty-six accidents, including one fatal, occurred in the testing departments of electrical manufacturing works; twenty (three fatal) occurred in connection with electric cranes, and inadequate protection of cables and wires in factories accounted for four fatalities. The greater number of fatalities, including all those in the ordinary use of electricity as distinguished from generation and distribution and in electrical manufacturing processes, occurred as usual on a.c. circuits where the pressure to earth or pressure of shock did not exceed low pressure; there were 17 such fatalities at low pressure.

During the year a number of further changes in public supply systems from direct to alternating have been put in hand. In the case of a supply to factory premises, such a change necessitates compliance with a number of the regulations from which the factory had previously been exempt, and rightly so on account of the increased dangers. There are many d.c. installations which may have been in use from twenty to thirty years which are quite unfit for use with alternating current.

Prosecutions, mostly following on serious or fatal accidents due to breaches of the regulations, were taken against 12 occupiers in respect of 26 offences; penalties varying from 20s. to £95 were imposed on 21 summonses. Three were withdrawn, and two dismissed on payment of costs. In one case the occupier took out a cross summons against a foreman under Section 141; the foreman admitted his neglect in not completing the earthing of certain apparatus, in consequence of which a fatal accident occurred. In view of his own distress over the matter he was merely admonished.

Condenser Water from Lower Lake Levels.—How large power plants could save thousands of dollars in summer coal bills by tapping lower levels of lake water, was the subject of a paper read before the American Society of Mechanical Engineers recently by Professor A. G. Christie, of which *Science-Supplement* gives some interesting details. By placing intakes for cooling water for use in condensing steam so that they would reach the cold bottom layers of the northern lakes, Professor Christie showed that water from 10 to 20 deg. colder could be obtained. With this colder cooling water additional vacuum could be created in the condenser, with a resulting decrease in steam consumption, which he estimated would be equivalent to a saving of $36,956 in about 4½ months' operation of a 100,000-kW plant.

Manchester Association of Engineers.—On July 1st, some 150 members of the Manchester Association of Engineers visited Lincoln to view the various engineering works of Messrs. Ruston & Hornsby, Ltd. The visitors were received by Col. Ruston and his co-directors, who, with the staff, conducted them through the various departments. The works are principally employed in the manufacture of oil, gas, and steam engines, traction engines, boilers, and all classes of agricultural machinery. During luncheon the chairman gave a hearty welcome to the visitors, and a hearty vote of thanks was accorded to the company for courtesies extended and hospitality shown to the party. After tea the visitors proceeded to Lincoln Cathedral, where the principal architect explained the work now being done to prevent the building from falling into decay.

Parliamentary News.

[By Our Special Parliamentary Reporter.]

The Balfour Committee.—On June 29th, in reply to Mr. H. WILLIAMS, who asked when he anticipated receiving the first interim report of the Balfour Committee on Trade and Industry, Mr. A. M. Samuel, Secretary to the Department of Overseas Trade, said he was informed that a first volume entitled "Surveys of Overseas Markets," was about to be published. The volume was based on material furnished to the Committee from official sources, with an introduction by the Committee. It would not contain the Committee's recommendations, as they could not be formulated until it was able to consider the effect of the evidence as a whole. The Committee had received by now most of the evidence which it proposed to take but the representatives of certain important organisations remained to be heard.

Railway Electrification. — On June 30th, Mr. R. SMITH asked the Minister of Transport if the Government intended to take any steps with regard to the electrification of the main railways.

Col. ASHLEY said that the Government was considering the whole question of electricity. It might be assumed that any improvement in the supply and distribution of electricity would facilitate its use as a motive power on railways, as well as in other directions.

P.O. Electrical Apparatus. — On July 2nd, Sir WILFRED SUGDEN asked the Postmaster-General if he would call for details of all electrical and telephonic apparatus and supplies, including cables, needed by his department; and would he institute inquiries in the electrical industries of this country to ensure that the major supplies of this nature were manufactured in Great Britain instead of, as now, being mainly of foreign origin.

LORD WOLMER, Assistant Postmaster-General, said the hon. member was misinformed; more than 99½ per cent. of the electrical apparatus, including cables, purchased by the Post Office last year was manufactured in this country.

London and Home Counties Electricity Supply Scheme.—A Select Committee appointed by the House of Lords to consider the London and Home Counties Electricity District Order, met under the chairmanship of Lord Donoughmore on July 2nd. The Electricity Commissioners were represented by Sir John Snell and Sir Harry Haward, whilst there were also present representatives of the London County Council, the 10 London companies and the four London companies which have promoted the London Electricity Supply Bills Nos. 1 and 2 respectively, the Conference of Local Authorities owning Electricity Supply Undertakings, and the National Association of Local Government Officers. The terms of reference to the Committee were to consider whether the scheme had been sufficiently dealt with by departmental inquiry, whether an opportunity should be afforded for petitions against the Order, and what alterations or modifications were recommended.

Mr. SEAGER BERRY, representing the 10 London companies, put forward certain objections to the scheme of the Electricity Commissioners in its present form. In the first place, however, he informed the Committee that the 10 companies for whom he appeared, considered that the whole matter had been sufficiently dealt with by the various departmental inquiries, as well as in the discussions that had taken place on the Nos. 1 and 2 Bills. He said that his main point of objection was with regard to the clause in the Draft Order made by the Commissioners, which stated that all authorised undertakers in the district should contribute towards the administrative expenses of the Joint Electricity Authority when formed. Under the Electricity Supply Act of 1922, however, it stated specifically that the expenses of the Joint Electricity Authority were to be contributed by those authorised undertakers represented on the Joint Electricity Authority and therefore he contended that the provision in the Draft Order was *ultra vires*. At the present moment none of the companies in London was represented on the Joint Electricity Authority; he asked that the wording in the Draft Order should be the same as in the Act of 1922. According to the Statute an authorised distributor which was not represented on the Joint Electricity Authority could not be made to contribute towards the expenses of that authority, whereas by the terms of the Order all authorised distributors, whether represented or not, could be compelled to contribute. The position under the scheme would be that the Joint Electricity Authority, when formed, would generate electricity and supply to the local authorities; then the 10 companies which he represented would generate and supply to themselves, and finally there would be the other group of four companies generating and supplying to themselves. Although there was no competition between the three bodies generally, the Joint Electricity Authority could compete in the areas of the companies for large power loads such as docks, railways, &c., and to that extent the contribution of the companies towards the expenses of the Joint Authority would subsidise competition against them. However, the companies did not wish to hamper the Joint Electricity Authority in its inception, and he would make the offer that the companies should make this contribution towards the administrative expenses of the Joint Electricity Authority for the first five years. At the end of that time the Authority would be able to pay its way and as its expenses then should be on account of generation only, there should be no call upon the companies.

Mr. SYDNEY MORSE, for the Group of four companies, supported the amendment asked for by Mr. Berry.

On behalf of the London County Council the amendment was objected to. At the same time the Committee was asked to amend Paragraph 31 of the Order so that all authorised undertakers, whether local authorities or companies, should furnish statistics, &c., to the Joint Electricity Authority. At present under the Order only the local authorities were compelled to furnish those statistics which, it was stated, created the position that whereas the companies would be able to ascertain the position of the local authorities, the local authorities would not have similar information with regard to the companies.

Mr. MORSE said that this question had been before the Commissioners at all their inquiries and it had been agreed that the companies should have financial and administrative independence.

On behalf of the London County Council it was next asked that the date of election of members of the Joint Electricity Authority should be December instead of April, in view of the fact that the borough councils' elections were in November and that new members should come on to the Joint Authority immediately.

The National Association of Local Government Officers raised a point with regard to the compensation of officers and servants for loss of employment under the scheme. It was pointed out that under the Order no officer or servant could claim compensation if he had not been in the employ of the particular authorised undertaker before May 8th, 1919. This it was pointed out applied only to the local authority employés because in the two Bills relating to the companies no such limitation of date was imposed. It was understood that the Commissioners were not averse to making the scheme uniform for both companies and local authorities, but they feared that it would be *ultra vires* for them to do so having regard to a Section of the Act of 1919.

On behalf of the Conference of Local Authorities it was stated that if the Committee made the alteration asked for by Mr. Berry they must ask for permission to be heard against it.

Sir HARRY HAWARD, one of the Electricity Commissioners, said the Commissioners challenged Mr. Berry's interpretation of Section 5 of the Act of 1922 with regard to the contribution to the expenses of the Joint Electricity Authority by authorised undertakers. The intention all through had been that all authorised undertakers should contribute and nobody had contemplated the position that an authorised distributor would refuse to contribute towards the expenses of that Authority. There was no question of the Authority's paying its way, because there must always be administrative expenses so that no limit of time could be set during which authorised distributors could be asked to contribute towards administrative expenses. The Authority had not only to generate but it had to act in an advisory capacity, so that there would always be expenses which could not be put on to the charge for electricity supplied by the Authority to the local authorities. The fact that the Commissioners had to approve the estimates of expenditure each year by the Joint Authority was sufficient check upon extravagance which was suggested by Mr. Berry.

The CHAIRMAN said that the very important question raised by Mr. Berry would have to be carefully considered and a decision would be given later. With regard to the alteration concerning statistics suggested by the London County Council, the Committee did not think that that alteration should be made, neither did the Committee think that the date of election should be altered from April to December.

Sir HARRY HAWARD, dealing with the question of compensation, said the Commissioners were fully in sympathy with the suggestion of the N.A.L.G.O., but the only question was whether it would be *ultra vires*.

The Committee then adjourned; its decisions will be announced later.

Transfer of the U.S.A. Bureau of Mines to the Department of Commerce.—President Coolidge on June 4th by executive order transferred the Bureau of Mines from the Department of the Interior to the Department of Commerce. In furtherance of the same purpose the President some months ago transferred the Patent Office, and other bureaux will be similarly treated when the required legislation is obtained under the reorganisation Act. In many respects the two Departments were engaged on work of the same character, and the purpose of the transfer is to avoid duplication and to facilitate relations with the public.—*Science*.

Educational. — ROYAL TECHNICAL COLLEGE, Glasgow.—Department of Engineering. The Session 1925-26 commences on Tuesday, September 22nd. The Calendar, 3s. post free, and prospectus, gratis, can be obtained on application to the Director at the College.

MANCHESTER MUNICIPAL COLLEGE OF TECHNOLOGY.—The prospectus giving particulars of the courses in electrical, mechanical, and sanitary engineering, and in chemical, textile, and photographic technology, can be obtained free on application to the Registrar, College of Technology, Manchester. The new session commences on Thursday, October 8th. (See our advertisement pages to-day.)

Legal.

Theft of Wire.

THE Bristol *Evening Times and Echo* reports that Frederick Farren pleaded guilty at the Bristol Police Court on June 29th to the theft of 750 ft. of electric wire, valued at £2 12s. 6d. Mr. Reed, the owner of the wire, stated that he found the defendant putting the wire in the United Methodist Chapel and discovered that he had contracted with the chapel authorities to do the work for nothing if they would pay £35 for the materials.

The defendant was sentenced to a month's imprisonment with hard labour.

Manager's Claim for Wrongful Dismissal Settled.

IT was announced at the Derby Assizes last week that terms of settlement had been arrived at in the action brought by Mr. Daniel Wise, of Long Eaton, against the Concordia Electric Wire Co. for wrongful dismissal from the post of manager of the company's Sawley works.

Mr. CRAIG HENDERSON, K.C., for the plaintiff, said that the terms included the payment of compensation to his client.

Tucker v. Wandsworth Electric Mfg. Co., Ltd.

MR. JUSTICE TOMLIN, in the Chancery Division on July 3rd, had before him an action by Mr. J. B. Tucker, of Solihull, Birmingham, against the Wandsworth Electric Manufacturing Co., Ltd., of Birmingham for an injunction restraining an alleged infringement of his letters patent for electric switches.

Mr. WHITEHEAD, K.C., for the plaintiff, said the defence was that the patent was invalid and for this purpose the defendants relied on a number of prior specifications and alleged prior users, and they also said that they were not guilty of infringement. Explaining the nature of the action, Counsel said there was a general type of switch known as a "quick make-and-break" switch. Where one was dealing with fairly high voltages it was necessary that on the break there should be an adequate separation between the two parts of the contact, because, if it was not adequate, arcing might result. The plaintiff's specification described the invention in relation to a particular switch of the tumbler type. Reading the claims contained in the specification of the plaintiff's invention, Mr. Whitehead said the first claim was for a switch with quick make-and-break action by virtue of a compression spring pivotally operating on the one hand with a contact arm and on the other with an operating member which was utilised for positively displacing the contact arm in the operations both of making and breaking in the event of the spring failing to act or to act effectively. That claim, he said, had been infringed.

SIR ARTHUR COLEFAX, K.C. (for defendants) said the issue would turn on the words "pivotally co-operating . . . . with an operating member." The question was: Did this exclude the case of an intermediate member or did it include such a member?

The second claim, said Mr. WHITEHEAD, could be infringed by a device which differed only colourably from the device illustrated in the specification. What he said was that the defendants' apparatus, in so far as it differed from plaintiff's by having a slot cut in the contact arm instead of two lugs on it, and by the arrangement of an open compression spring as against one in a closed box, was only colourably different from the plaintiff's switch. It was not necessary for him to go so far as to say that a claim of this sort could be infringed by mechanical equivalents.

Expert evidence was given by Mr. G. E. Folkes as to the plaintiff's patent.

The hearing was adjourned.

Business Notes.

Commercial and Industrial Developments, Business Changes, Trade Opportunities, New Publicity Literature, Liquidations and Failures.

The "Electrical Review" Index.—The Index for the last half-yearly volume of the ELECTRICAL REVIEW (January to June, 1925), will shortly be published. Copies will be forwarded post free to those requiring them for binding or for reference purposes, if they will make application to the Publisher, ELECTRICAL REVIEW, 4, Ludgate Hill, E.C.4.

The E.D.A. Appeal.—Attention was called at a meeting of the Blackburn Town Council on July 2nd to the decision of the Electricity Committee to increase its annual subscription to the British Electrical Development Association to £156. Alderman Higham (chairman of the Electricity Committee) said the Association acted on similar lines to the British Commercial Gas Association. The only difference in Blackburn was that the Electricity Committee paid its Association £100 less than was the case with the Gas Department.

A Manchester Dispute.—A correspondent states that members of the Manchester City Council have been circularised by the local electrical factors concerning certain friction with the Corporation Central Purchase Committee. The complaint is made that all city factors have been omitted from the list of firms whose tenders for electric lamps have been accepted. It is contended that the Committee does not save any intermediate profits, as the local tenders were the same as, or lower in price and discount than, those of the favoured firms. The point of the grievance is that the Corporation should, quality and price being equal, give its own ratepayers an opportunity of making a living.

Radio Corporation Restrained from "Spying."—The *Electrical World* states that the application of the De Forest Radio Company for an injunction restraining the Radio Corporation from using spies in the De Forest plant and soliciting information from the De Forest employés has been sustained by Vice-Chancellor Backes in Newark, N.J. The vice-chancellor modified the existing injunction to the extent of permitting the Radio Corporation to make use of information already obtained as evidence in a pending litigation, but denied the Corporation the right to maintain an organisation of spies in the De Forest plant.

Trade Announcements.—MESSRS. C. HARRISS & Co., electrical power engineers, of Strover Street, Gillingham, Kent, have changed the name of the firm to The Electrical Power Repair Co. The same partners (Messrs. C. Harriss and W. Orrick) continue; the object of the change is to indicate the special nature of the business, which is the repair of armatures, stators, rotors, &c.

The offices of *Combustion* have been removed to Hampden House, 84, Kingsway London, W.C.2.

Mr. R. FERGUSON BROWN, late of Glasgow, who has resumed business as an electrical engineer and contractor at 3, Ewenfield Road, Ayr, desires to receive catalogues, &c.

Mr. R. H. TURNER, of St. John's Road, Eastwood, has taken over the wireless business of Mr. H. Handley, of 193-195, Infirmary Road, Sheffield.

MR. S. E. HUNT, electrical engineer and contractor, has opened new premises at 8a, Torwood Street, Torquay.

MR. E. MERCER, electrical and radio engineer, has opened new showroom premises at 37, Bridge Street, Castleford, Yorks.

MESSRS. E. HODGKINS & Co., have removed to 64, Stafford Street, Birmingham. Telephone No. "Central 65."

MESSRS. WOOD & CARLING have removed to 161, Wardour Street, London, W.1. New telephone No.: "Regent 4796."

Bankruptcy Proceedings.—F. A. FRASER, 33, Tothill Street, Westminster, S.W.1, electrical engineer.—The first meeting of creditors herein was held on June 26th at the London Bankruptcy Court, and in the absence of any resolution the administration in bankruptcy was left in the hands of the Official Receiver. According to the debtor's statements it appeared that some 30 years ago he obtained employment with a telephone company, eventually becoming engineer. Some 16 years ago a company was formed and he became a director and engineer, and he continued with it until it went into liquidation last year. On January 1st a new company was formed, and the assets, goodwill, lease, &c., of the old undertaking were bought from the Official Receiver. The new company was now carrying on business at the same address. The debtor estimated his liabilities at £3,000, of which the greater portion was due in respect of guarantees. He attributed his present position to the loss of his investments in the old company in which he held two-thirds of the shares, and he possessed no assets whatever.

J. E. LOCKING, 14, Fish Street, Kingston-upon-Hull, dealer in cycles and wireless goods.—The public examination of this debtor was held on June 29th at the Guildhall, Hull. The statement of affairs showed liabilities of £291, against assets of £46. Debtor was formerly a dock labourer, and commenced business as a cycle dealer in 1922. Later he opened a workshop and stocked radio apparatus, purchasing stock to the value of £250. When he gave up the business his stock only realised £18, although the debtor considered it was worth £150. The examination was closed.

J. R. PATTISON, 15, Goldsmith Street, Nottingham, electrical supplies factor.—The public examination of this debtor was held on July 2nd at the County Court House, Nottingham. The statement of affairs showed liabilities of £2,266, against assets of £280, or a deficiency of £1,986. Debtor stated that he commenced business as an electrician in July, 1920, with £500 lent by his father-in-law. He was in financial difficulties by the end of 1923, and his father-in-law advanced him further sums from time to time. The examination was closed.

G. HILL, G. NOBLE and E. COWLEY (G. Hill & Co.), electrical engineers, 29, Chantry Lane, Gt. Grimsby.—Supplemental dividend of 2 13/16d. in the £, payable at the Official Receiver's office St. Mary's Chambers, Great Grimsby.

H. A. Birleson (Birleson & Co.), electrical engineer, Clarence Buildings, Back Fazackerley Street, Chorley.—First and final dividend of 2s. 7½d. in the £, payable at the Official Receiver's office, 11, Winckley Square, Preston.

F. J. North, electrical engineer, 13a, Midland Road Wellingborough.—Receiving order made June 25th, on debtor's own petition. First meeting, July 8th, at the Official Receiver's office, The Parade, Northampton; public examination, July 10th, at the County Hall, Northampton.

S. O. Cowper-Coles, galvanising plant manufacturer, Rossall House, Thames Street, Sunbury-on-Thames.—Application for discharge to be heard on July 31st, at the Court House, Kingston, Surrey.

H. Fildes, electrical engineers' superintendent, 108, Monton Road, Eccles.—Receiving order made June 25th, on creditors' petition.

W. R. Grigsby (Wenham Lighting Corporation), electrical factor, 184, Gray's Inn Road, W.C.—Trustee, Mr. E. H. Hawkins, 4, Charterhouse Square, E.C., appointed June 25th.

B. N. Halson, electrician, 29, Mayfield Road, Northfleet, Kent.—Trustee, Mr. A. H. Ward, Official Receiver, 280a, High Street, Rochester, released May 20th.

F. W. Caseley (The Radiograph Co.), wireless engineer, 5, Hepworth Arcade Kingston-upon-Hull.—Receiving order made June 30th on debtor's own petition.

D. Bould, motor and electrical engineer, Burn Croft, Birchencliffe, Huddersfield.—Trustee, Mr. W. Durrance, 12, Duke Street, Bradford, released June 19th.

Private Arrangements. — W. R. Thornton & Son, Ltd., electricians, Barrow-in-Furness.—The creditors interested herein were called together on June 29th, when Mr. Houston, representing several trade creditors, was elected to the chair. A statement of affairs as at May 30th last showed liabilities of £9,652, of which £7,214 was due to unsecured creditors, £2,000 was in respect of debentures, £75 secretary's remuneration, £62 Inland Revenue, and £300 contingent liabilities. The assets were valued at £2,667, from which preferential claims of £400 had to be deducted, leaving net assets of £2,267, or a deficiency of £7,385. Mr. W. H. Vale, who had been appointed receiver and manager of the company by the debenture holders, stated that although the ledger showed book debts of £2,550, these had been set down at £1,121. During the last two years, the company had lost £6,000. The chairman said that after the debentures had been deducted there would be nothing available for the unsecured creditors.

The contingent liabilities were stated to be in respect of a claim which had been received for £298 for commission on sales. It was not known whether the claim was good or not.

The company was formed on September 29th, 1916, with a nominal capital of £5,000, of which £4,301 was issued and paid up. The consideration for the purchase of the assets was fixed at £4,300. The company originally carried out contracting work but during the war discontinued contracting, and became a wholesale house. Branches were opened in Reading and Bradford, but these had not paid, and the Reading branch had been closed. Since January 1st, 1925, four bad debts at the Bradford branch had involved a loss of £1,000, and it was consequently decided to close that branch. The business was founded over 64 years ago.

Mr. Thornton, one of the debenture holders, said that rather than see the business go out of existence, he would take it over, continue it himself, and pay the creditors 2s. 6d. in the £.

The meeting was of opinion that some further investigation should be made regarding the valuation of the assets, and eventually it was decided to appoint a committee consisting of Messrs. W. B. Campbell (W. T. Henley's Telegraph Works Co., Ltd.), G. T. Etches (Edison Swan Electric Co., Ltd.), and Arthur T. Eaves, C.A., representing the General Electric Co., Ltd. The committee, it was intimated, would issue a report to all the creditors after the investigations had been completed, advising whether the offer of 2s. 6d. in the £ should be accepted or not.

H. & T. Edwards, electricians, trading as George Miles, 12, Waterloo Road, Smethwick.—A meeting of the creditors of the above was held recently, when a statement of affairs was presented, which had been prepared by Messrs. Poppleton and Appleby, Birmingham. The liabilities were set down at £427, of which £414 was due to unsecured creditors and £13 to the bank. The assets were estimated to realise £197, less £22 for preferential claims, leaving net assets of £175, or a deficiency of £253. It was reported that the debtors took over the business from their mother in April, 1922 and latterly the turnover had declined. A writ was recently issued against them and they consulted their solicitors, who advised the calling together of the creditors. The creditors decided to accept a composition of 5s. in the £, payable in cash within ten days.

Company Liquidations.—Henry R. Leveson & Co., Ltd., electrical engineers and contractors, 55, Park Lane, Leeds.—A meeting of creditors of the above was held on July 3rd at Leeds. Mr. J. P. Wardale, the liquidator in the voluntary liquidation of the company, submitted a statement of affairs which showed ranking liabilities of £1,788. The assets were estimated to realise £641, from which had to be deducted £28 for preferential claims, leaving net assets of £613 12s. 11d., or a deficiency of £1,175, so far as the unsecured creditors were concerned. The company was registered on March 19th, 1924, with a nominal capital of £2,500 of which £1,500 had been issued. It took over an existing business, and the vendors were allotted £1,000 in fully-paid shares. There were only three shareholders, two being the vendors to the company. The third shareholder introduced £400 in cash and stock to the value of £100 in payment for the 500 shares transferred to him. During the 13 months to April of the present year the sales totalled £5,012, with a loss of £736. The deficiency was accounted for by the loss on trading and depreciation of stock. A resolution was passed in favour of an application being made to the Court for the appointment of Mr. C. H. Baker, Leeds, as the liquidator of the company, whilst a committee was also appointed, consisting of Mr. F. Crosland and the representatives of the Metropolitan-Vickers Electrical Co., Ltd., and Messrs. Dawson & Co., Ltd.

Liverpool Electrical Engineering (1923), Ltd.—Winding up voluntarily. Liquidator, Mr. C. Hodgson, 70, Central Buildings, 41, North John Street, Liverpool. Meeting of creditors, July 13th, at 70, Central Buildings. Particulars of claims to the liquidator by August 31st.

Weaverham Electricity Supply Co., Ltd.—Winding up voluntarily. Liquidator, Mr. H. L. Dale, 4, Darwin Street, Northwich. Meeting of creditors at 20, Winnington Street, Northwich, on July 16th. Particulars of claims to the liquidator by August 4th.

F. S. Petrol Electric Omnibus Co., Ltd.—A meeting of members is called for August 5th at 119, Moorgate, E.C., to hear an account of the winding up from the liquidator, Mr. S. H. Clench.

Electrolite, Ltd.—First meeting of creditors and contributories, July 15th, at 29, Russell Square, W.C.

Tele-Dis Services (Founders' Company), Ltd.—First meetings of creditors and contributories were called for July 9th at Carey Street, W.C.

Electric Distributing Co., Ltd.—Winding up voluntarily. Liquidator, Mr. H. S. Jones, 3, York Street, Manchester.—A meeting of creditors was called for July 3rd.

Airco Aerials, Ltd.—A meeting of members is called for August 5th at the offices of Messrs. A. J. Hill, Vellacourt & Co., 2, Broad Street Place, E.C., to hear an account of the winding up from the liquidator, Mr. C. W. Weston.

Dissolutions of Partnership.—Hutton & Quirk, electrical engineers, 120, Brook Street, Dundee.—Messrs. M. Hutton and T. Quirk have dissolved partnership. Mr. Hutton will attend to debts and continue the business on his own behalf at the same address.

Parker & Frizzell, motor and electrical engineers, The Garage, Grosvenor Road, Richmond, Surrey.—Mr. C. Parker and Mr. L. T. Frizzell have dissolved partnership. Mr. Frizzell will continue the business.

Meeting of Creditors.—Astro Electric, Ltd.—A meeting of creditors is to be held at the offices, Carlton House, Lower Regent Street, London, S.W., on July 14th, when Mr. R. Rook Jones, the receiver and manager, will submit his report on the present position of the company.

Catalogues and Lists.—The Jackson Electric Stove Co., Ltd., 143, Sloane Street, S.W.1.—A blotter bearing a calendar for July and an illustration of an electric iron.

Also three priced and illustrated pamphlets dealing respectively with the "Jackson" electric wash boiler; electric hot cupboards and carving tables; and laundry, &c., irons.

Siemens & English Electric Lamp Co., Ltd., 38-39, Upper Thames Street, E.C.4.—July price sheet of electrical materials, appliances and accessories.

Ateliers de Constructions Electriques de Charleroi, 56, Victoria Street, S.W.1.—July stock list of motors and dynamos.

The Magna Wire & Cable Co., Ltd., 137, Victoria Street, S.W.1.—List C151, a net trade price list of v.i.r. and lead-covered cables; also an advertising blotter.

Messrs. Herbert Morris, Ltd., Loughborough.—A price list of electric hoist-blocks. Illustrated.

Tok Switches, Ltd., Granville House, Arundel Street, W.C.2.—A calendar-blotter advertising the "Aristocrat" interlocking switch plug.

The General Electric Co., Ltd., Magnet House, Kingsway, W.C.2.—Publication F3707, containing an illustrated description of the "Wembley" street-lighting lantern with views of installations.

Sulzer Bros., 31, Bedford Square, W.C.1.—A pamphlet illustrating an installation of the firm's Diesel-engine generating plant.

Messrs. Ferranti, Ltd., Hollinwood, Lancs.—A leaflet illustrating a 30,000-kVA bank of Ferranti 11 000/120,000-V transformers.

Messrs. L. McMichael, Ltd., Hastings House, Norfolk Street, Strand, W.C.2.—An illustrated folder describing the company's plug-in transformers, condensers, &c., for h.f. amplification.

Westinghouse Electric & Manufacturing Co., East Pittsburgh, Pa., U.S.A.—Four illustrated pamphlets dealing respectively with motors for mine locomotives, oil circuit-breakers, anti-vibration lampholders, and baking ovens.

The Regent Trading Co., 2, Woodlands Road, Harrow.—A priced and illustrated pamphlet advertising the "Regent" mica undercutter and glass brush.

Cryselco, Ltd., Kempston Works, Bedford.—A price list of valves of various British makes.

Higgs Motors, Witton, Birmingham.—July stock list of a.c. and d.c. motors.

The Norwest Electrical Manufacturing Co., Ltd., Motherwell, N.B.—A card bearing illustrations of "Norite" products.

NOBEL INDUSTRIES, LTD., Nobel House, S.W.1.—An illustrated brochure describing the company's exhibit at the British Empire Exhibition.

MESSRS. MAY & PADMORE, Tyseley, Birmingham.—A priced and illustrated folder advertising "Maymore" electric soldering irons, including one for radio work.

THE BRITISH THOMSON-HOUSTON CO., LTD., Mazda House, Newman Street, Oxford Street, W.1.—A brochure describing the company's new showrooms &c., at the above address.

MESSRS. J. STONE & CO., LTD., Deptford, S.E.14.—An illustrated catalogue of "H-R" gears for various applications. Also a folder dealing with the same subject.

MESSRS. CROSSLEY BROS., LTD., Openshaw, Manchester.—Publication No. 2,435, containing a report of a test carried out on "Crossley" heavy-oil engines at a pumping station. Also Publication No. 2,436, illustrating and describing the "Crossley-Premier" multi-cylinder heavy-oil engines.

Book Notices.—"History of the Telephone and Telegraph in Uruguay, 1886-1925," is the title of a brochure by Mr. Victor M. Berthold, of the American Telephone and Telegraph Company. This little Republic had a telegraph service for 21 years before the Government started a national system, in 1887; but in 1892 the Government took over nearly all the telegraph systems then in operation, and in 1894 decided to inaugurate a telephone service. The author minutely chronicles the rather stormy course of events leading up to these results, after which he devotes some 50 pages to the history of the various telephone concessions, of which the chief holder is the Montevideo Telephone Company. The conditions under which the service was carried on were extraordinary, an excessive demand for increased wages on the part of the employés in 1922 being supported by the Administrative Council of Montevideo and the Government, although the latter was then negotiating for the purchase of the undertaking. At the beginning of this year the question of nationalising the service was still unsettled.

"Commercial Credit Risks—Export Credits and Credit Insurance," by A. H. Swain. Pp. 143. London: Sir Isaac Pitman & Sons. Price 5s. net.

The author of this treatise, upon a subject which is of the first importance in the light of the present unsettled condition of the world, is the chairman of the Leicester Electricity Committee and a member of the East Midlands Electricity Advisory Board. The opening chapter of the work deals with the present position of credit insurance in the United Kingdom, and extended consideration is given to the Export Credits scheme of the Department of Overseas Trade. This is followed by a brief study of conditions in the United States in this respect. In the next two chapters the attitudes of the insurance companies and the banks are examined. The other chapters deal with the Government and the "catastrophe" risk; status information; a historical note on the Fuggers of Augsburg and their financial problems (similar to present-day matters in many respects); financial facilities; and a suggested commercial clearing house on a mutual basis in which the conclusions drawn from the preceding chapters are "crystallised" in a definite way. There are two appendixes, one reproducing a *questionnaire*, circulated by the D.O.T., relating to insurance against bad debts in export trade; the other a statement by Mr. Arthur Kitson on the American financial crisis of 1893.

"Mechanical Appliances, Mechanical Movements, and Novelties of Construction," By Gardner D. Hiscox, M.E. Pp. 412; fully illustrated. London: Constable & Co., Ltd. Price 21s. net.—This volume contains short illustrated descriptions of 998 engineering devices chiefly mechanical, which have either been put on the market or are merely suggestive ideas.

The issue of the *Mechanical World* for July 3rd is the first of a new series of that journal enlarged by 25 per cent. and containing a number of new features, without sacrificing existing ones, and without any increase in subscription rates. The journal is an old friend, and we are glad to see it progressing and extending its usefulness to the engineering industry.

"The *Journal* and Record of Transactions of the Junior Institution of Engineers." Vol. XXXV. Part X. July, 1925. London: Percival Marshall & Co.

"The *Journal* of the South African Institution of Engineers." Vol. XXIII, No. 11. June, 1925. Price 2s. net.

Sofia to Compensate Belgian Company.—The International Tribunal has just given its award in the action brought by the Société d'Electricité de Sofia, a Belgian undertaking, against the municipal authorities of Sofia in respect of the seizing of its central station and distribution system in 1914. The award is in favour of the company, which is not only to have its plant handed over immediately, but the concession is to be extended for 20 years without further payment. In addition, the Municipality is ordered to pay the company an indemnity of 9 million Belgian francs.

Social Events.—The sixth annual sports of the General Electric Co., Ltd., were held on Saturday, June 13th, on the main playing field at Witton, which, together with the Magnet Club building, has been provided by the company for the benefit of its employés. The "Harold Hirst" Cup for the 100 yards flat race was again won by A. Bird, of the Witton Works.

G.E.C. GALA AND ANNUAL SPORTS.—In celebration of the official opening of its new sports ground at Wembley, the General Electric Co., Ltd., held a successful gala day at the ground on Saturday last. Many sports events took place, the most outstanding being probably a cricket match between teams representing the head office and other London establishments of the company, the result being a draw. During the afternoon the chairman, Sir Hugo Hirst, Bart., declared the ground open. In his address he referred to the recent honour which had been conferred on him, and said that it was not due to his work alone, but also to that of the G.E.C. staff which had supported him. He was a sportsman, and wished to see sports fame attained in the company; he would be willing to defray the expenses of any member of the firm who could get into the Olympian games. Lady Hirst subsequently presented the prizes to the winners of the events of the day. The new ground comprises about 17 acres, including five football and four cricket pitches, 12 tennis courts, and a pavilion.

The Hackbridge Transformer Sports Club recently held its annual sports meeting at the new sports field adjoining the company's works at Hersham. About 2,000 employés and friends attended. The prizes were distributed by Mrs. J. F. Cleeves (wife of a director) at the close of the meeting, after which the large assembly participated in dancing on the lawn and in the amusements of a first-class fair.

The annual "outing" of the employés of the Merthyr Electric Traction & Lighting Co., Ltd., took place on June 25th, the party proceeding to Weston and Cheddar by charabanc and boat. Mr. F. J. Cursons (secretary) presided at dinner at Weston, and tea was taken at Cheddar. The arrangements were very successfully carried out by Mr. E. J. Rowlands.

On June 27th the employés of Messrs. Gent & Co., Ltd., held their annual "outing." The party travelled from Leicester to Matlock Baths and from the latter centre explored the Peak District in groups. The co-operation of the directors added to the day's enjoyment.

"Amplion" Loud-speakers Abroad.—At a time when complaints of German penetration into the British radio market are heard on all sides, it is of interest and satisfaction to see the process reversed. The accompanying picture is a view of a stand at a recent Frankfort fair, on which

"Amplion" Loud-Speakers at Frankfort, Germany.

"Amplion" loud-speakers (Messrs. Alfred Graham & Co.) were prominently displayed by the Cie. Continentale Amplion. Messrs. Graham have also sent us two other photographs, one showing an exhibit of "Amplions" at Copenhagen and the other a similar display at Toronto.

Annual Holidays.—The works of the Metropolitan-Vickers Electrical Co., Ltd., will be closed for the annual holidays from the evening of Friday, July 24th, until the morning of Tuesday, August 4th.

Lead.—Reporting on July 4th, Messrs. James Forster and Co. stated:—"Buying by cable makers on a moderate scale was chiefly responsible for yesterday's advance, accentuated by some 'bear' covering of July lead. This small amount of buying was sufficient in the present firm state of the market to send the price up 10s. a ton. . . . A steady consumption is going on in this country of from 18-20,000 tons a month, and whereas a month or two ago there was plenty of lead to meet it, there are signs now, owing to short arrivals in June, of lead for prompt delivery becoming more difficult to obtain."

British Trade-mark Applications.—The following are among the recent applications for British trade marks. Objections against any of the proposed marks may be entered within one month from July 1st:—

Exaphone. No. 458,424. Class 8. Instruments and apparatus used in telephony.—The International Exaphone Co., Ltd., Derby.

Spartanite. No. 458,714. All goods in class 8.—Fuller's United Electrical Works, Ltd.

Meron. No. 457,981; Neron. No. 457,991; and Maron. No. 457,994. Class 8. Instruments and apparatus, and parts thereof, for use in radio-telephony and telegraphy. No. 457,982. Class 13. Electric lamps (ordinary), lamp-holders, electrodes, &c.—Osram Gesellschaft, 11-14, Ehrenbergerstrasse, Berlin, O.17, Germany. (British representatives: Cruikshank & Fairweather, 65-66, Chancery Lane, W.C.2.)

Matched Tone Trade Mark (lettering and design). No. 455,643. Class 8. Headphones and parts thereof for use in radio-telephony.—Brandes, Ltd., 296, Regent Street, W.1.

Receptite. No. 456,917. Class 8. Detector crystals for use in radio-telephony.—W. T. Cocking and D. E. Salari, trading in co-partnership, 78 Estcourt Road, South Norwood, S.E.25.

The Condition of French Industry.—The Paris correspondent of the *Daily Mail* recently said:—"In nearly every industry French factories are working overtime and are yet unable to meet all their contracts, not only for the home markets but also for abroad. Big metallurgical and electrical firms have large orders for foreign markets, notably for China and other parts of the Far East."

Japanese Electrical Imports.—The destruction of the Government archives in Tokio by the earthquake of September, 1923, involved the loss of a mass of statistics, including those relating to foreign trade. This accounts for the non-appearance of any detailed figures since the publication of those for 1921. The total figures of two important items in the import list for the years 1922 and 1923 are as follows:—Electrical machinery and apparatus, 12,824,555 yen and 11,359,210 yen, respectively; and insulated electric wire, 485,107 yen and 1,885,053 yen, respectively.

Registration of Trade Marks in China.—The British Chamber of Commerce announces that the period for registering marks under Clause 4 of the Trade Mark Law has been extended to December 31st, 1925.—*Reuter* (Shanghai).

"Relay" Exchanges for Switzerland.—Last year the Director-General of Telephones, Berne, Switzerland, installed as an experiment a small "Relay" automatic telephone exchange in one of the rural areas of Switzerland. The Swiss telephone authorities have now ordered a further twenty "Relay" exchanges for installation in various places in Switzerland.

New Zealand's Electrical Imports.—The *Board of Trade Journal*, in a review of New Zealand's external trade during the first quarter of the current year, states that Great Britain increased her share of the trade in electrical machinery and appliances, having supplied 70 per cent. of the total imports, which were valued at £632,000.

Australian Tariff Applications.—In May last Amalgamated Wireless (Australasia), Ltd., applied to the Australian Tariff Board for the imposition of an increased scale of duty upon imported radio apparatus and for the free admission of the raw materials of the industry. Considerable opposition was encountered by these proposals, a representative of the British General Electric Co. stating that the admission free of duty of headphones (which it was suggested should be classed as "raw material") would result in a heavy loss to those firms who held large stocks of the appliances, as they would be drastically undersold by cheap imported apparatus which had not paid duty.

Scanlon's Electric Co., a firm of switchgear manufacturers, asked for increased duties on knife switches, low- and medium-pressure fuses, and motor-starting equipment. It was stated that a number of English concerns were landing this gear at prices which gave local manufacturers "considerable trouble."

Another firm, making telephone apparatus, asked for increased protection in respect of this class of goods. A representative of the Ericsson Telephone Co., in opposing the application, said that Australian manufacturers could not produce one-tenth of the Commonwealth's telephone requirements.

The Tariff Board's decisions in these cases are not yet to hand.

Alleged "Price Ring" in Australia.—At a meeting of the Sydney City Council in May, the question of concerted tendering was again raised. It was stated that tenders were invited for the supply of rubber-insulated cables; nine offers were received and they all bore the same price. The Council decided to eliminate two companies from the list as it was alleged that they were concerned in the recent "scandal" of adding an extra amount to a tender for distribution to the unsuccessful tenderers. It was left to the general manager (Mr. Forbes Mackay) to decide which firm should receive the contract.

Unemployment.—An increase of 19,330 occurred in the number of unemployed persons during the week ended June 22nd, the total at that date being 1,299,700. This represents an increase of 285,918 in the past twelve months.

For Sale.—Woolwich Corporation Electricity Department has for disposal one 1,500-kW Willans-Siemens turbo-alternator plant. (See our advertisement pages to-day.)

The Chinese Disorders.—The Shanghai correspondent of the *Daily Telegraph* reported on July 5th that the Municipal Electricity Department had decided to cut off the bulk of the power supplies at noon on July 6th, while maintaining lighting. "This action will affect chiefly the Chinese mills, most foreign concerns being idle. Essential undertakings will be excepted, but the action will not only affect the settlement mills, but mills outside, as settlement power plant at the riverside, recently completed at a cost of 30,000,000 taels, and selling over 300,000,000 kWh annually, supplies many Chinese outside the settlement through a native electricity company. The decision will mean total industrial cessation inside the settlement and restriction of production outside, but the department announces that this is inevitable owing to inability to maintain output since the strike of Chinese. The general opinion is that this step will shorten the duration of the strike."

Street Lighting in Tottenham Court Road.—The old series arc-lighting system in Tottenham Court Road, London, has been replaced by 1,000-watt Siemens gasfilled lamps arranged in series between the outers of a three-wire d.c. distribution system, the change-over involving very little expense. As a result, the whole of the thoroughfare is brilliantly illuminated, and the buildings stand out in bold relief.

The New Chester Showrooms.—The new showrooms acquired by the Chester Electricity Department at a cost of £10 000 were recently inaugurated by the Mayor. The premises are in one of the busiest shopping thoroughfares and have an imposing appearance, the entrance being flanked by two attractive show windows in which washing machines and other domestic appliances have been arranged. In the main shop is a series of recessed tiled hearths in which electric fires of various patterns are fitted. Another notable feature is a varied array of lighting fittings. A commodious oak counter provides space for the display of numerous small appliances, and full use is made of showcases in all odd corners and niches. On the same floor a suite of rooms has been arranged with the appropriate electrical equipment; this comprises a dining-room, a bedroom, and a bathroom. On the top floor are the Department's offices. Every appliance is to be provided with a card showing its consumption, initial cost and running cost. Particular attention is given to electric cooking, the Corporation having instituted very favourable rental and hire-purchase systems for cookers. Prior to the opening ceremony the efficacy of electric cooking was practically demonstrated by the provision of an electrically-cooked dinner in which members of the Electricity Committee participated at the invitation of their chairman. The reconstruction of the premises and their layout were carried out under the supervision of Mr. W. A. Gillott, A.M.I.E.E.

New "Exide" Depôt.—On July 1st, the Chloride Electrical Storage Co., Ltd., opened a new depôt at Tureen Street, Gallowgate, Glasgow, where every facility for the sale, charging and repair of accumulator batteries is available. The new premises will be under the control of Mr. McDonald Sinclair, A.M.I.E.E., the company's general representative for Scotland.

The Reduction of Railway Expenses.—The railway companies of Great Britain have made proposals to the trade unions in which their employés are organised which, it is estimated, will result in a reduction of £6,000 000 in their annual expenditure. Briefly, it is suggested that the whole of the officials, staff and employés, shall consent to a "cut" of 5 per cent. in their fees, salaries or wages, for a period of a year, at the end of which the position would be reviewed. The trade unions have raised the question of the application of the scheme to stockholders, but the companies have so far not replied to this. The companies promise that if the unions agree to the "cut" they will restore the railway workshops, which are at present on short time, to the full working week.

Rumanian Export Taxes.—According to *La Dépêche Commerciale*, the Rumanian Government is imposing an export tax on a number of classes of goods. These include electric motors, which are subject to a levy of 5 lei per kg., and "electric burners" ("*becs électriques*"), 5 lei per 100 kg.

An American View of European Electrical Conditions.—The *Electrical World* quotes the views of Mr. H. E. Irish, purchase engineer of the Western Electric Co., who recently returned from a six months' business trip abroad. Mr. Irish says that European business conditions seem to be generally better. "Credit and money are to some extent more stable; unemployment, although serious in England, has been greatly reduced in Germany, and is not an important factor in France. Political conditions, upon which almost everything depends, seem gradually to be becoming somewhat more settled." The development of power and lighting companies is going ahead rapidly in many countries, but the lack of standardisation is a serious bar to manufacturers seeking to enter this field. There is always a certain demand for American electrical equipment, but in the main Mr. Irish believes that the American contribution will be along the line of leadership in new technical developments rather than the export of any great quantity of supplies.

"This is in part because electrical development is influenced to so large an extent by political conditions," said Mr. Irish. "The telephone, radio, and, in some instances, power, are in general controlled by the governments. The use of electricity was stimulated by the war, and is probably growing faster than it otherwise would have grown, but most of the manufacturing will probably continue to be done in local national factories. The employment situation has added force to this policy, which is a deliberate one. Home industry is generally supported even when better supplies could be obtained from another country at lower prices. This preference for home products will probably continue. National feeling at the present time is particularly high, and the opportunities for exporting electrical supplies to Europe may be less now than at some periods in the future."

Radio is reported as being apparently popular, and Mr. Irish received the impression that a much wider popularity is at hand. This, however, is thought to be limited by inherent characteristics of European nations, which will probably prevent a sweep of radio enthusiasm comparable to that in the United States.

New Netherlands Tariff.—The *Board of Trade Journal* of July 2nd contained a translation of Groups V and IX of the schedule of goods which will be dutiable under the Netherlands Tariff Law of 1924. The first group comprises electro-technical articles, including all kinds of switch- and fuse-gear, measuring instruments, rectifiers (except rotary and mercury-vapour types), static transformers, &c. Group IX includes telegraph, mining, and signalling apparatus, &c. All goods in these classes are subject to a duty of 5 per cent. *ad valorem*.

The Persian Electrical Market.—According to the *British Export Gazette,* importers into Persia are experiencing a growing demand for electric fans, irons, and vacuum cleaners, and other electrical appliances. This applies mainly to the cities where current is available, but, in addition, the more prosperous among the landowners are beginning to install self-contained lighting and power outfits for their homes, gardens, and estates, and the sale of motors, both for alternating and direct current, is likely to increase steadily. The vogue was introduced during the war by the British military forces stationed along the Persian Gulf, and by inference the bulk of the supplies should be drawn from the United Kingdom.

The F.B.I. and the Pensions Bill. — The Federation of British Industries has addressed a protest to the Government against the extension of the Insurance Acts to provide for widows', orphans', and old age pensions. The Federation states that the burden of social services already bears hardly on industry and the additions now proposed will be highly detrimental; indeed, in the cases of trades which are exposed to the full force of foreign competition they may well involve actual disaster.

The State of German Industry.—Activity on the German metal market, says the *Deutsche Bergwerks Zeitung,* has again dwindled after a short period of liveliness. The improvement in the orders received in the machine building industry is worthy of mention. The cable works and the electrotechnical industry are still well employed; the Post Office in particular seems to have been giving larger orders of late. The brass works have also plenty of work in hand, but considerable quantities of semi-finished goods are being offered in the trade at low prices. The situation in the labour market has hardly changed.—*Reuter's Trade Service* (Essen).

New French Company.—A new company has recently been formed with the title La Société Hydro-Electrique de l'Afrique du Nord, to establish an electric power station to utilise the water power of the River Ould-el-Berd in Algeria.

New Swiss Company.—Under the auspices of the Bernischen Kraftwerke Gesellschaft, a new company has been formed in Berne under the title of the Oberhasli Kraftwerke Gesellschaft, to establish and work the large new hydro-electric station at Oberhasli.

Irish Free State Electrical Imports.—As a measure of economy, the Irish Free State Government, at the commencement of the present year, ceased to issue its usual monthly detailed import and export returns, only monthly summaries being now issued. The latest of these available is for the three months ended with March last, during which period the imports of electrical goods—a term which apparently does not include generators, motors, and other electrical machinery—attained a value of only £73,568, as compared with £100,893 in the corresponding quarter of 1924.

Lighting and Power Notes.

Australia. — TASMANIA.—*Launceston.*—We have received from Mr. R. J. Strike, city electrical engineer, a copy of his report, together with the statement of accounts of the electricity undertaking for the year ended June 30th, 1924. The total revenue was £59,517, and the working expenses were £44,426, leaving a gross profit of £15,091. The figures for the previous year were: Income, £56,125; working expenses, £32,753; gross profit £23,373. After meeting capital charges there was a deficit of £557, as compared with a surplus of £8,061 in the preceding year. The electrical energy sold amounted to 4,836,076 kWh, an increase of 629,055 kWh. The Council decided to change over the voltage of supply to consumers from 110/190 to 240/415 V, and a portion of the South Launceston area was completed during the year.

Birmingham.—YEAR'S WORKING.—The statement of accounts of the Corporation electricity undertaking (engineer, Mr. R. A. Chattock) for the year ended March 31st last, records a total revenue of £1,182,622, as compared with £1,110,028 in 1923-24. Working expenses totalled £736,855, as against £668,197, leaving a gross profit of £445,767 (£441,831), to which was added bank interest of £2,884, and the sum of £31,000 brought from the reserve fund, making a total of £479,651. This was distributed as follows:—Interest, £180,465; redemption of debt, £176,621; payment to the Tramways Department in respect of feeders, cables, &c., £1,368; payment to the Tame and Rea District Drainage Board in respect of railway siding, £449; borough rate, £31,000; surplus carried to renewals and special expenditure account, £89,370. The surplus on the previous year's working was £102 224. The amount spent on capital account during the year was £841,567, and was made up as follows:—Land, £1,028; buildings, £105,312; machinery and plant, £446,186; mains, £289,042. The sales of electrical energy amounted to 193,370,748 kWh, an increase of 22,218,158 kWh, and the average price per kWh obtained fell from 1.556d. to 1.468d. The motor connections increased from 186 927 to 206,160 h.p., and the lamp connections in 60-watt lamps from 556,068 to 659,666.

Chester.—LOAN SANCTIONED.—The Electricity Committee has received sanction to the borrowing of £10,000 for mains for supplying electricity to the parishes of Tarvin, Barrow and Aldford.

Continental.—BELGIUM.—A new 4,800-6,000-kW turbo-alternator set is being installed at the power station connected with the collieries of the Société des Charbonnages Winterslag. An electric winding engine is also in course of erection.

GREECE.—Owing to the increasing demand for electricity in the town of Salonica, the Société des Tramways et Eclairage Electrique de Salonique is now establishing a new central power station.

Crediton.—ELECTRICITY SUPPLY.—The question of an electricity supply for the district was considered by the Urban District Council at a recent meeting, when it was stated that the Electricity Commissioners had refused to sanction the erection of a generating station at Crediton. The clerk stated that the commissioners had communicated with the Exeter City Council to the effect that the terms offered for supplying Crediton with electricity in bulk were excessive and that in consequence Exeter had submitted revised terms as follows:—£250 for the first year's supply, £300 for the second year, £350 for the third year, £400 for the fourth year, and £500 for each succeeding year. The Council decided to consider the matter further in committee.

Croydon.—YEAR'S WORKING.—The report of the borough electrical engineer (Mr. A. C. Cramb) on the working of the electricity undertaking for the year ended March 31st last, shows a total revenue of £204,757, as compared with £173,150 in the preceding year. Working expenses, including special expenditure charged to revenue account, amounted to £138,898 as against £124,841, leaving a gross surplus of £65,859 (£48,309). After providing for capital and other charges there was a net surplus of £9,194, as compared with £2,446 in 1923-24; this was transferred to reserve. The capital expenditure during the year amounted to £152,074, the main items being £67,035 for machinery and plant, and £42,538 for mains. The sales of electrical energy increased from 14,947,610 to 18,724,318 kWh and the average price per kWh obtained fell from 2.728d. to 2.498d. The maximum supply demanded rose from 8,600 to 9,200 kW. The extensions to the works which it was hoped to have completed last autumn were held up by a delay in the completion of the reconstruction of the buildings, but it is anticipated that the work will be completed and the new 10,000-kW turbo-alternator installed in time for next winter's load.

Dalkeith.—ELECTRICITY SCHEME.—It is proposed that the existing main of the Lothians Power Company should be extended to the Dalkeith generating station, where a metering and control panel, a transformer, and converting plant should be installed. Mr. Dixon, Dumbarton, for the Electric Supply Corporation, is to furnish the Town Council's engineer with the details and probable cost of the proposed scheme.

Ilford.—LOANS.—The Urban District Council has applied for sanction to loans of £20,000 for mains and services, and £2,000 for apparatus to be let out on hire.

Kingston-on-Thames.—ELECTRICITY SUPPLY.—Application has been made by the Town Council for sanction to a loan of £4,000 for extending the mains in the Cambridge Road area. The Council has sealed an agreement with the Twickenham and Teddington Electricity Supply Co., Ltd., for a supply of electricity in bulk to the company for distribution to consumers at Ham.

Keighley.—NEW FEEDER CABLES.—The Electricity Committee has recommended to the Town Council that the existing feeder cables in connection with the railless-car system be replaced by new and larger cables and that new control gear be provided at the generating station at a total estimated cost of £4,000.

Liskeard.—ELECTRICITY SUPPLY.—The proprietors of the Liskeard (Cornwall) Gas Co. have confirmed a resolution to convert the old private company into a limited liability company, with a view to developing the supply of electricity. It was stated that it was hoped the installation of plant would be sufficiently advanced to enable current to be supplied during the coming autumn.

Liverpool.—YEAR'S WORKING.—The accounts of the Corporation electricity undertaking (engineer Mr. H. Dickinson) for the year ended March 31st last, show a total revenue of £1,037,673, as compared with £966,338 in 1923-24. Working expenses amounted to £591,269, as against £528,937, leaving a gross profit of £446,404 (£437,401), which was distributed as follows: Interest, £153,524; repayment of loans, £597; contribution to Bootle Corporation stock redemption fund, £1,277; sinking fund contributions, £130,579 (£2,851 contributed by the Housing Committee); renewal fund, £43,278; city rate, £120,000. During the year £535,909 was spent on capital account, the chief items being £184,107 for mains, £154,308 for machinery, £113,148 for buildings, and £84,245 for accumulators.

London.—ST. MARYLEBONE.—The report on the working of the Borough Council's electricity undertaking (engineer, Mr. C. H. Smyth) for the year ended March 31st last, records a total income of £435,628, as compared with £406,226 in 1923-24. Working expenses totalled £220,999, as against £220,548, leaving a gross surplus of £214,630 (£185,678), to which was added interest on bank balances, &c., making a total of £215,850. After deducting capital charges there was a net surplus of

£49,614, as compared with £32,654 in the preceding year. The capital expenditure during the year amounted to £159,632, the chief items being £123,560 for extensions of plant and £18,915 for mains and services. The sales of electrical energy increased from 43,770,345 to 50,667,433 kWh, and the maximum supply demanded rose from 25,506 to 28,003 kW. The average price per kWh obtained fell from 2.11d. to 1.94d.

Hampstead.—The accounts of the Borough Council's electricity undertaking (engineer, Mr. J. Leadbeater) for the year ended March 31st last, show a total revenue of £142,009, and working expenditure of £105,422, leaving a gross profit of £36,588. After deducting capital charges there was a net profit of £10,732. The previous year's working resulted in a net profit of £21,717. The capital expenditure during the year amounted to £31,093 the chief item being £12,700 for mains. The sales of electrical energy increased from 10,110,363 to 11,818,702 kWh, and the average price per kWh obtained fell from 3.35d. to 2.80d. The maximum supply demanded rose from 5,675 to 6,100 kW.

Manchester.—Loans.—The Electricity Committee has recommended to the City Council that application be made for sanction to loans of £420,000 for mains, transformer stations, &c., and £25,000 for street lighting.

Progress During Past Year.—The sales manager's annual report for the year ended March 31st last shows that the total connections during the year amounted to 25,369 kW, and that 9,277 applications were received. The number of consumers increased by 3,526, and the number of hired electrical cookers connected by 401 to 678.

Morecambe.—Electricity Extensions.—The Electricity Committee has recommended the installation of another e.h.p. feeder from the Lancaster generating station, at a cost of £12,500, to supply electricity in the Heysham area.

Peterborough.—Loan.—The Electricity Committee is applying for sanction to borrow £5,000 for the provision of services.

Electricity Extensions.—The electrical engineer and the city surveyor have been instructed to prepare plans for extensions at the generating station.

Electricity in Bulk.—The Electricity Committee is in communication with the Electricity Commissioners and Sir Charles Bright & Partners, Ltd., with regard to the proposal to give a bulk supply of electricity to the Spalding Urban District Council.

Price Reductions.—Reductions in the charges for electricity have been made or recommended in the following districts:—

Shipley.—Lighting: 6½d. per kWh. Domestic power: 2¼d. per kWh. Charges subject to a discount of 2½ per cent. for prompt payment of accounts.

Sutton Coldfield.—Lighting: A reduction of ½d. per kWh. Charges for heating, cooking, and power have also been reduced.

Salford.—Lighting: From 4¾d. to 4½d. per kWh. Alternative annual charge rate for lighting: The kilowatt charge reduced by 10s. Heating: From 1¾d. to 1½d. Power: Varying from 2½d. to .9d, according to quantity consumed. Alternative annual charge for power: From £7 10s. per kW and .40d. per kWh (under 25 kW), to £7 per kWh and .375d. per kWh. Special reductions have also been made in contract rates for power. The charges have also been reduced in Prestwich urban district.

Swansea.—Lighting: From 6d. to 5½d. per kWh. Maximum demand rate: Percentage increase from 40 to 20. Power: From 25 per cent. to 12½ per cent. above the pre-war rate. Heating and cooking: From 2d. to 1½d. per kWh for the winter quarters.

Pwllheli.—Electricity Agreement.—The Town Council has decided to sign an agreement with the Gwynedd Trust, Ltd., to supply the town with electricity at 6d. per kWh for public lighting and 9d. per kWh for domestic use. The company is prepared to proceed with the scheme at once, and the Council has agreed to withdraw all objections to an Order.

Southend-on-Sea.—Inquiry.—An inquiry is to be held by the Electricity Commissioners on July 14th, to ascertain the manner in which the electricity supply has been administered.

Loans.—The Town Council has applied for sanction to the following loans in connection with the electricity undertaking:—New plant and works £40,000; excess expenditure, £7,100 and £2,980; a.c. mains, converting plant, switchgear, and transformers, £25,000.

Special Orders.—Applications have been made to the Electricity Commissioners for Special Orders by the following authorities:—Wrexham Corporation, for the supply of electricity in parts of the rural district; the Derbyshire and Nottinghamshire Electric Power Co. in certain parishes in the rural district of Shardlow.

The Commissioners have submitted to the Minister of Transport for confirmation an Order made by them, for the supply of electricity by the Stanley Urban District Council in its area.

St. Austell (Cornwall).—Electricity Scheme.—A scheme of electrical development is proposed by the St. Austell Electric Light & Power Co., Ltd. The object is the supply of electricity in the entire area in which the company has powers, embracing the towns of St. Austell and Fowey, St. Blazey, Par, part of St. Mewan, and in all 15 parishes, but as a first instalment it is intended to cater for half this area. On a site outside St. Blazey and close to the Par-Newquay railway line, a power station is to be erected with a capacity of 1,250 h.p. Work will be commenced upon it in a few weeks' time, the scheme having been sanctioned by the Electricity Commissioners. The rates to be charged in the new area will be 10d. per kWh for lighting and 6d. per kWh for power.

Stoke.—Extension of Supply.—At a recent meeting of the Electricity Committtee the engineer reported that he had, with the borough electrical engineer of Newcastle-under-Lyme, interviewed the Electricity Commissioners regarding a supply being given in the western portion of the North-West Midlands electricity district and that the Commissioners would favourably regard any applications for the necessary powers to give supply to large and long-hour consumers therein. He further reported that the development of supply in the North-West Midlands district would probably involve extensions of the central power house.

Plant Extensions.—The Electricity Committee has instructed the engineer to prepare a preliminary report upon extensions to the central power station to meet prospective demands which will have to be met in about three years.

Electricity Agreement.—A communication has been received from the borough electrical engineer of Newcastle-under-Lyme with regard to the Madeley and Parkhouse collieries, and the engineer reported upon the terms which had been discussed by the Newcastle Electricity Committee, and these were approved. It was agreed that subject to an agreement being entered into for a supply of not less than an average of 2,000,000 kWh per annum for a period of seven years or more, with a maximum demand of not less than 100 kVA or more than 750 kVA, such a supply should be given and that the engineer should report as to the necessary mains.

Swansea.—Loan.—The Town Council is applying for sanction to a loan of £33,137 for mains.

Walton-on-the-Naze.—Electricity Supply.—There are now 463 houses and shops taking a supply of electricity, the total number of meters in use being 524. Street lighting extensions are being carried out by the Urban District Council.

West Ham.—Year's Working.—The accounts of the Borough Council's electricity undertaking (engineer, Mr. F. W. Purse) for the year ended March 31st last, record a total revenue of £367,874, and working expenditure of £236,550, leaving a gross profit of £131,324, to which was added interest and other sundry items, making a total of £133,208. The previous year's figures were: Income, £335,885; working expenses, £229,172; gross profit, £106,713. Capital charges absorbed £94,356 and there was a net profit of £38,852 as compared with £21,577 in 1923-24. Of the profit, £15,940 was contributed to the borough fund, and the remainder transferred to reserve. The capital expenditure during the year, which included £16,462 for mains and £11,196 for transformers, &c., amounted to £31,996. The electrical energy sold increased from 50,612,888 kWh to 58,307,188 kWh, and the average price per kWh obtained fell from 1.58d. to 1.50d. The maximum supply demanded rose from 19,040 to 21,900 kW. The engineer's report states that during the year a contract was placed for a third 10,000-kW set, three water-tube boilers, and additions to the coal-handling plant, and it is anticipated that the new plant will be in commission before the coming winter. The interconnecting link between East Ham and Ilford was laid during the year, and a bulk supply to Ilford was commenced in December last.

Tramway and Railway Notes.

Australia.—Tasmania.—*Launceston.*—The accounts of the City Council's tramway undertaking (superintendent, Mr. R. J. Strike) for the year ended June 30th, 1924, record a total income of £54,886, as compared with £53,097 in the preceding year. Working expenses totalled £37,181, as against £35,468, leaving a gross profit of £17,705 (£17,628). Interest absorbed £8,471, and £1,503 was contributed to sinking fund, leaving a net surplus of £7,731 (£7,553), which was transferred to reserve. The car-mileage increased from 466,361 to 472,701, and the number of passengers carried from 4,403,454 to 4,540,999.

Continental.—Rumania.—At the recent annual meeting of the Société des Tramways et Eclairage Electriques de Braila, in Brussels, it was stated that negotiations were in progress with the municipal authorities of Braila regarding an extension of the concession. The existing power station having become unequal to the demands, a scheme for increasing the capacity of the plant is being considered, to finance which it is possible the concern will be converted from a Belgian to a Rumanian undertaking.

Bulgaria.—The first electric railway line to be built in Bulgaria was opened on June 28th. It links Sofia with its chief suburb, Kniajevo.

Belgium.—La Société Nationale des Chemins de Fer Vicinaux is about to commence work on the electrification of the local railways between Antwerp and Wyneghem and between Antwerp and Wommelghem.

Germany.—At a recent meeting of the Baden Architects' and Engineers' Association, Herr Meyer stated that water power to the extent of 4,500 million kWh was available in Baden. The cost of electrifying the Mannheim-Basle section of the railway was estimated at £4,000,000, and £2,300,000 for the Mannheim-Heidelburg and Carlsruhe-Heidelberg sections. No date can be fixed for the commencement of the electrification work, as the matter of finance has yet to be settled.

(Continued on page 63.)

The Rugby Radio-Telegraph Station.

Some Notes on the Plant and Constructional Work.

THE accompanying illustrations of some of the plant that is being installed at the radio-telegraph and telephone station which the Government is building at Hillmorton, near Rugby, for communication with India, Australia, and South Africa, convey some idea of the magnitude of the constructional work involved. It is hoped to complete the station, which is being constructed by the Post Office Engineering Department, by the end of this year, and it has already been announced that the Western Electric Co., Ltd., is manufacturing the telephonic apparatus that is being installed, which will make transatlantic radio-telephony possible. Distant control from the Central Telegraph Office in London will be provided by direct land lines.

A general view of the exterior of the power house is shown in fig. 3. Three 500-kW motor-generator sets have been installed for furnishing the h.p. supply to the valves at from 12,000 to 18,000 V; the sets consist of 6,000-V d.c. generators connected in series and driven by synchronous motors. The machine illustrated in fig. 1 is of the British Thomson-Houston Co.'s manufacture, and it will be noticed that its bedplate stands on insulators. Fig. 2 is a view of the main power switchboard, while fig. 4 shows one of three 640-kVA, 12,000/2,200-V, 3-phase, 50-cycle Johnson & Phillips transformers. The station will use 54 metal-glass Western Electric valves, which will be connected in parallel and excited by an auxiliary oscillator. The filament supply will be provided by a 200-kVA, 416-V, 100-cycle synchronous motor alternator, and 700 tons of concrete have been used to build a ferro-concrete reservoir, which will contain the 500,000 gallons of water needed in connection with the cooling system of the transmitting valves.

Fig. 3.—General View of the Power House.

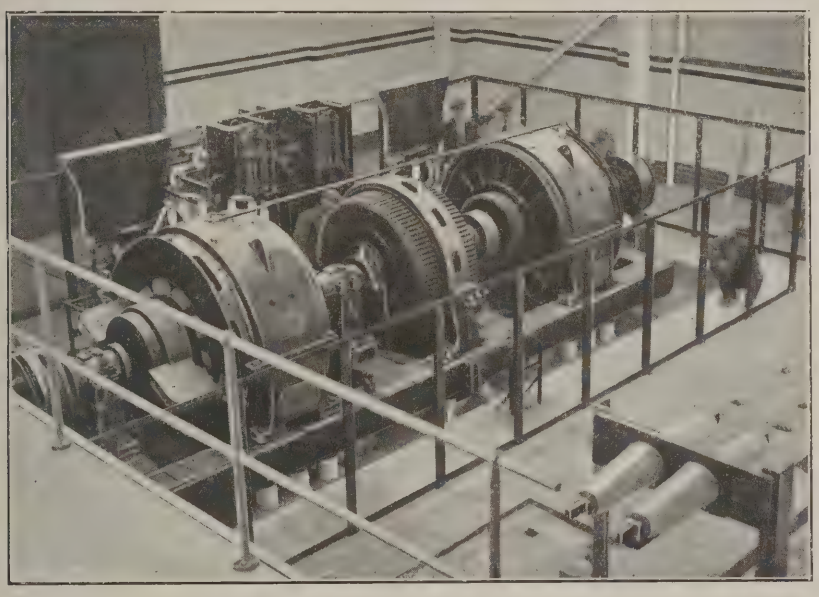

Fig. 1.—One of the 500-kW Motor Generators.

What is claimed to be the world's largest bank of mica condensers is being supplied by the Dubilier Condenser Co. for installation at Rugby. They are constructed in such a manner that should a plate fail, it can be detected and replaced in a short time. Some of the contactor switchgear to be used in the station is being made by the General Electric Co., Ltd. Some 8,000 tons of concrete have been utilised for constructing the mast foundations and the anchor blocks to which the stay ropes are attached. For making stays alone, 3,000 miles of wire have been used; the stay ropes were all made on site, for which purpose

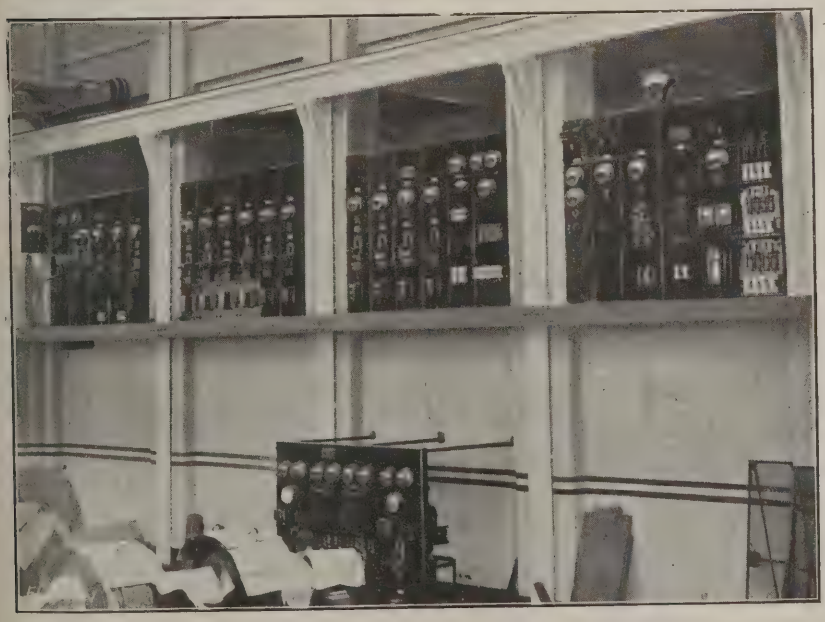

Fig. 2.—Main Power Switchboard.

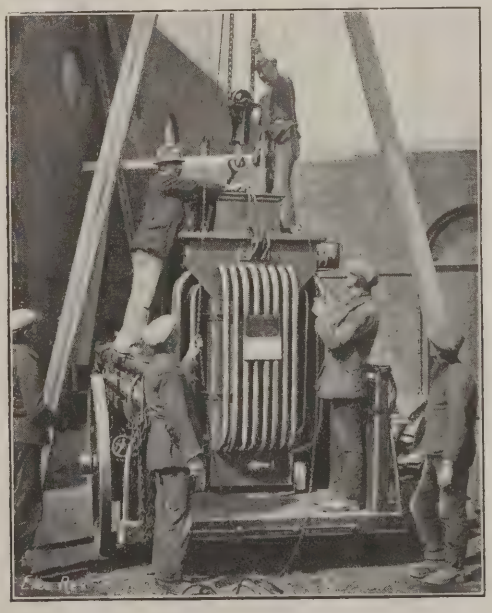

Fig. 4.—Unloading a Power Transformer.

special machinery was provided. The 150 wires, composing each of the largest stays, were drawn out, two by two, and then clamped together mechanically before being bound together with steel wire, the ends of the stays being bent over and fitted into tapered sockets, into which low-temperature melting metal was run so as to bind the ends of the wires.

Fig. 5.—Laying Earth Wires.

The 12 main lattice-steel masts have been nearly completed; they are 820 ft. high, and are supported on porcelain insulators and granite blocks as indicated in fig. 6, the maximum downward thrust of each mast being 400 tons. The aerial will take the form of wire "sausages," which will be supported by means of 12-ft. diameter steel spreaders, the whole being clamped to steel cables that pass down the centres of the masts. The aerial will be $2\frac{3}{4}$ miles in length. Each of the cables will have to withstand a tension strain of 6 tons on a calm day, the masts themselves being designed for a top horizontal pull of 10 tons, but during strong winds these figures will be considerably exceeded, and as a precautionary measure slipping devices have been fitted to the drums of the cable winches, one of which can be seen at the base of the mast in fig. 7. It is of interest to note that the top of a mast has been seen through a telescope to oscillate 3 ft. beyond a central position about its pivotal base. When designing them, however, allowance was made for a deflection of 8 ft., with a safety factor of from 3 to 6.

Fig. 6.—Pivoted Base of Mast.

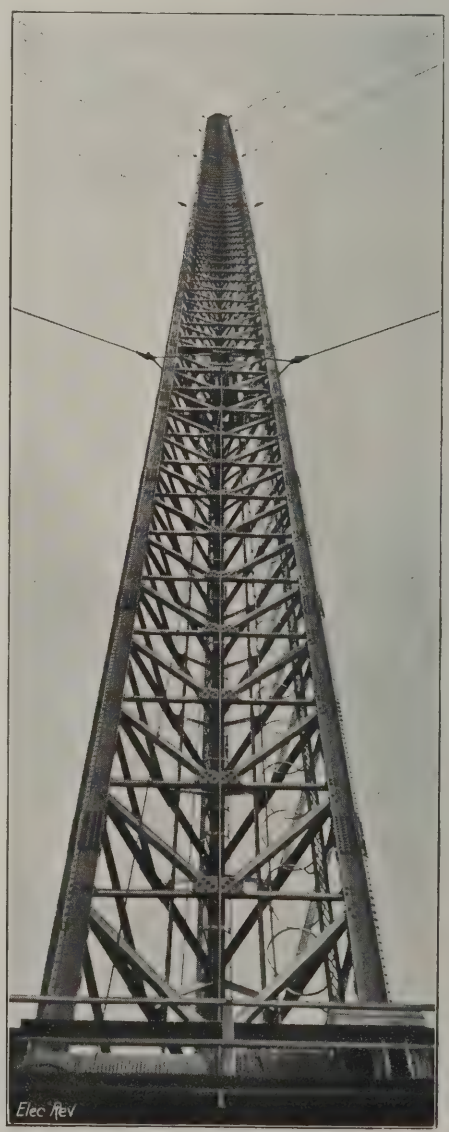

Fig. 7.—An 820-ft. Mast.

The "earth" system consists of about 80 miles of wire laid in the ground with the aid of a plough which was designed and built, with much of the other special plant

in use at Rugby, by the P.O. engineering staff. The plough, fig. 5, in a single operation, cuts a trench less than 1 in. in width, lays the wire, and partly fills in the trench again.

As no plant existed with which the porcelain mast insulators could be adequately tested electrically, a 100-kW steam-electric set was erected at Rugby for the purpose, the 500-volt d.c. being converted into high-frequency current by means of an electric arc and oscillating circuit. Up to April last 2,000 insulators had been tested at a pressure of 15,000 volts and a frequency of 50,000 cycles per second, no insulator being passed if an appreciable rise of temperature was recorded after a period of one hour.

It is noteworthy that the application of this voltage and frequency to defective insulators has occasioned, in some cases, a sufficient rise in temperature to melt the porcelain. It was the failure in this way of some of the Leafield insulators that caused the P.O. Engineering Department to inquire into the behaviour of various insulating materials.

Fig. 10.—Switchboard and some Condensers.

being teak, yellow deal, and satin walnut, all of which are superior to two well-known proprietary synthetic resin and cellulose materials which are generally regarded as suitable for high-frequency work.

Fig. 8.—Testing Aerial Insulators at Rugby.

Fig. 11.—Some of the Valve Panels.

In connection with the manufacture of large inductance coils, investigation has revealed American white-wood (Canary) to be the most suitable material (being quite cool at the end of the test), the next best in order

Fig. 9.—Aerial "Lead-in."

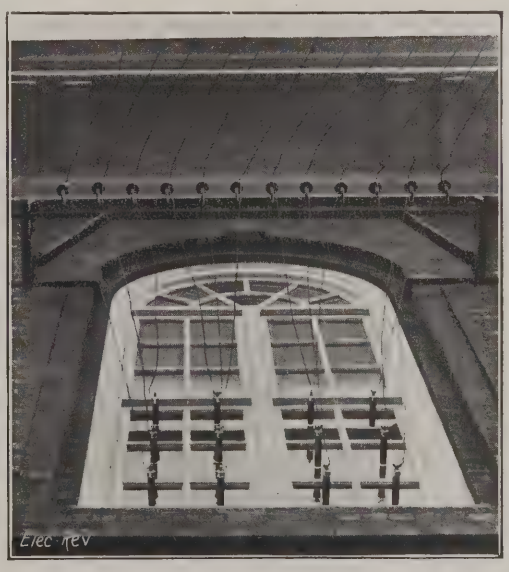

Fig. 12.—Earth "Lead-in."

In conclusion, we have to express our indebtedness to the *Post Office Electrical Engineers' Journal* for permission to reproduce figs. 5 and 6, and for some of the details set out above.

Electricity on a 100-ton Motor Yacht.

The Electrically-Equipped Yacht "Mahceeb."

Successful trials have recently been completed of the 100-ton yacht *Mahceeb*, constructed at Hampton-on-Thames by Messrs. Thornycroft for Mr. Henry Beecham, under the supervision of Messrs. Wells & Kemp, naval architects. The vessel is of the schooner type, having fore and aft rig. It carries two pole masts fitted with foresail, fore staysail and main sails; it is 92 ft. long, the beam being 16 ft. 6 in., and the draught 6 ft. The hull has been constructed to Lloyd's special survey, class

Fig. 1.—The Motor Yacht "Mahceeb.

16, A1, and is built of double skin teak on English oak frames, the decks and covering boards being also of teak.

Equipped with two Thornycroft engines, fitted with reducing and reversing gears, and having a total output of 15 b.h.p., the yacht will attain a speed of nearly 11 knots when running on both engines, and about $8\frac{3}{4}$ knots on one engine. These speeds are said to be remarkably good for a vessel of the given dimensions.

In addition to the main propelling machinery, the engine room is equipped with a Thornycroft M/2 type, 15-b.h.p. generating set, arranged at the forward end. This supplies electrical energy to the capstan, and also for cooking, heating, and lighting purposes throughout the boat. Fuel and oil tanks are arranged at the after end of this compartment, while on the port side are to be found the tool rack and work bench, and space has been provided for water pumps.

The accommodation has been laid out to embody the fullest degree of comfort possible on the dimensions. The headroom throughout is ample; that in the guests' quarters is 7 ft., and in the deckhouse over 6 ft. The owner's cabin, situated just aft of midship, extends the breadth of the yacht. The decoration of this compartment is very attractive, and consists of Indian grey wood framing and panelling, all French polished, the roof being in flatted white. All the furniture is of grey wood, and includes a large double bed, full-height wardrobes on each side, dressing table, settee, and writing desk. A bathroom of good size is arranged on the port side adjoining the owner's cabin, and is reached from the passage running aft. Separate taps provide for hot and cold water and also salt water to both bath and wash basin, a No. 4 Bastian storage electric geyser, ship's pattern, providing the hot water for the bath and the cabins. The guests' staterooms are arranged aft, two being on the port side and one on the starboard. The decoration and furnishing of these rooms are similar to those in the owner's cabin, but in mahogany; a wardrobe is provided in each, and lockers are also arranged underneath the berths. A wash basin with hot and cold water taps is also fitted in each room.

A servants' cabin is situated in proximity to these state rooms, and is fitted up with two berths, the top one being made to hinge up. As in the other compartments, a wardrobe and wash basin are provided. Access to the baggage room and linen cupboard aft is arranged from the servants' cabin. The crew space forward is of good size and fitted with four folding cots, also the usual furniture and fittings. The captain's and engineers' quarters adjoin, and in these are provided two sofa berths and one folding berth with drawers underneath, a hinged table, cupboards and cushioned seat. A large and well-equipped galley and pantry occupy the space between these quarters and the engine room, and is fitted with every electrical convenience. One sectional hob and two ovens are installed for cooking. The hob is fitted with Bastian "Quartzalite" heating elements, which, it is claimed, are immune from damage if milk, &c., is spilt over them, an important consideration aboard ship. The elements are easily removable for cleaning, &c. The ovens are of the light sheet-iron type, and the doors are arranged with glass panels to enable the chef to see the progress inside without opening the doors. The two ovens are built on the multiple unit system, so that additions can be easily arranged. A No. 3 size storage geyser is also fitted in the pantry for general use. As it is intended that meals should be taken in the deck saloon, a lift is provided between this and the pantry directly underneath; a staircase gives direct access to the pantry from the deck. A view of the interior of the pantry, showing the cooking apparatus, &c., is shown in fig. 2.

Fig. 2.—A Corner of the Electrically-equipped Pantry.

Electric fires, fitted with "Quartzalite" elements, are provided in the various compartments. These are of the Adam 1,000- and 500-W patterns, finished to match the decorative schemes.

A view of the *Mahceeb* afloat is shown in fig. 1.

Tramway and Railway Notes.

(*Continued from page 58.*)

Chesterfield.—RAILLESS CARS.—An exhaustive report on the tramway system has been prepared by Mr. G. H. Margrave, the former manager, in which he estimates that the natural life of the present tramway will be reached about two years hence, and recommends the adoption of a railless-car system. He states that the new capital needed for railless traction would be £39,954, with £10,269 additional for interest and sinking fund. To modernise the present system would cost £64,308 capital and £11,423 interest, &c., while petrol 'bus capital would total £35,400, with £12,132 interest. Mr. Margrave estimates a profit of £2,100 on railless cars, a loss of £4,691 on tramways, and a loss of £3,720 on petrol 'buses.

Croydon.—YEAR'S WORKING.—The report on the Corporation tramway undertaking (manager, Mr. T. B. Goodyer) for the year ended March 31st last shows a total revenue of £112,685, as compared with £112,021 in the preceding year. Working expenses amounted to £141,537, and recoverable expenditure charged to revenue £3,796, making a total of £145,333, as against £121,734, leaving a gross deficit of £32,649 (£9,713). Capital charges absorbed £26,188, and there was a net loss of £58,837, as compared with a deficit of £25,543 in 1923-24. The number of car miles run increased from 2,240,584 to 2,570,542, but the number of passengers carried fell from 19,946,512 to 19,552,621.

Ipswich.—YEAR'S WORKING.—The accounts of the Corporation tramway undertaking (manager, Mr. A. S. Black) for the year ended March 31st last record a total revenue of £41,776 (railless-cars, £4,084), as compared with £42,348 in 1923-24. Working expenses amounted to £35,328 (railless-cars, £3,245), as against £35,254, leaving a gross profit of £6,447 (£7,094). After deducting capital charges, there was a net surplus of £2,937. The number of car-miles run increased from 587,348 to 582,729 (railless cars, 38,565 and 61,698 respectively), and the number of passengers carried from 5,719,168 to 5,922,474.

Kirkcaldy.—YEAR'S WORKING.—The report on the working of the Corporation tramway undertaking for the year ended May 15th last shows a total revenue of £35,167, and working expenditure of £24,595, leaving a gross profit of £10,572. The figures for the previous year were—revenue, £35,372; working expenses, £24,757; gross profit, £10,615. Capital charges absorbed £6,456, and there was a net profit of £4,116, as compared with £3,838 in 1923-24. The number of car-miles run fell from 429,425 to 426,790, but the number of passengers carried increased from 5,205,865 to 5,543,456.

London.—REOPENING OF KENNINGTON STATION.—The Tube station at Kennington was re-opened for traffic on Monday, July 6th. This station was closed in November, 1923, and has since acted as a base for the engineering operations in connection with the enlarging of the City & South London Railway tunnels and latterly with the new Underground extension from Kennington to Charing Cross. Considerable progress has been made with the elaborate junctions and tunnel work at Kennington, and when this work is completed, trains from the Hampstead or City lines will be able to continue southwards to Clapham and Morden. At the present rate of progress the "Kennington Loop" will be opened for traffic early in 1926, as also will the new extension from Clapham to Morden.

Middlesbrough.—INQUIRY.—A Ministry of Transport inquiry was held on June 25th relative to the Corporation's proposal to widen Newport Road. The estimated cost was stated to be £17,231, of which £15,000 would be expended on a new tramway track.

Sheffield-Rotherham.—RAILWAY ELECTRIFICATION.—In an exhaustive report on road and rail communications to the Rotherham Regional Planning Committee, Mr. W. R. Davidge, a member of the Town Planning Institute has recommended a regular 10-minute railway service between Sheffield and Rotherham, and the electrification of the line.

Telegraph and Telephone Notes.

Azores.—GERMAN CABLE STATION.—An agreement has been concluded between the German and Portuguese Governments whereby the buildings in Horta, Fayal, which belonged to the German Atlantic submarine telegraph cable station, and were taken from it at the outbreak of war, are now to be given back to the company. The German Government, in return, has renounced all right to the German Church in Lisbon, and the German Government and Cable Company also undertake to forgo all claims in the matter against the Portuguese State. The agreement in no way affects the reparations owed by Germany to Portugal.—*Reuter* (Lisbon).

Belgian Congo.—NEW TELEPHONE LINE.—The Compagnie des Chemins de Fer du Congo Superieur au Grands Lacs Africains is erecting a new 430-mile telephone line along its railway system.

Canada.—NEW RADIO STATIONS.—Arrangements are being made by the north-west territories branch of the Department of the Interior to erect three radio stations in the far north. They, it is thought, will help materially the work of the police, navigators, and traders who are cut off from civilisation for so many months in the year. Edmonton, Alberta, will be the southern terminus of the system.—*Reuter* (Ottawa).

Electrophone Service.—As already announced, the electrophone service, which commenced 35 years ago, is being discontinued on account of insufficient use having been made of it since the establishment of radio broadcasting. There were 644 subscribers to the service on June 1st, and it is understood that Lord Wolmer, Assistant Postmaster-General, is willing to discuss the possibilities of granting a licence to a company wishful to provide such a service.

Persia.—THE TELEPHONE SYSTEM.—In 1903 a concession was granted to a group of Persians for 60 years, its terms exempting telephone buildings from all Government taxes, and all equipment consigned to the company from customs duties. The Societe Generale des Telephones de Perse, with headquarters at Teheran, is the present holder of the concession; the owners of two-thirds of the shares of stock must be Persian subjects. The 24 telephone magneto exchanges serve a total of 2,639 subscribers; the subscribers must furnish their own instruments, which are mostly of Swedish manufacture, but there are also Russian and German makes in service. A few American and English instruments are on sale, but are not in general demand. Besides the exchanges belonging to or licensed by the telephone monopoly, there are exchanges in Gilan Province, Resht, Isfahan, and a number of private exchanges bordering the Persian Gulf. The latter are, as a rule, operated by the British military authorities. The central office equipment in Teheran is of Russian manufacture and has been in service about 20 years. There are five branch exchanges and at present 1,350 subscribers, the average number of calls being 414 per day. General reconstruction of the plant is now under way, says *Commerce Reports*, and all of the equipment has been purchased in Germany. Bare iron wire on poles is being replaced in part by underground cables, and hereafter subscribers will not be required to furnish their own instruments. Eleven other exchanges average 66 subscribers each.

Spain.—TELEGRAPH IMPROVEMENTS.—A Government appropriation is announced for the improvement of Spanish telegraph lines and for relaying the cable between Spain and the Canary Islands.

Sweden.—NEW RADIO STATION.—Sweden's largest telegraph establishment, the Trans-Atlantic radio station at Grimeton, near Varber, was opened by the King on July 2nd. After the inauguration, the King addressed a long telegram to President Coolidge, who answered in cordial terms.—*Reuter* (Stockholm).

Radio Notes.

East Africa.—PROPOSED STATION.—Colonel Norman Harrison a director of the Western Electric Co., who has just concluded an investigation into the possibilities of wireless in Kenya and Uganda, advocates the erection of a broadcasting station at Nairobi, with a daylight range of 400 miles, serving the whole of East Africa, says *The Times* Nairobi correspondent. He considers that such a station, coupled with a public address system, would prove invaluable to the Education, Medical, and other Departments. The cost of the proposed station would be at least £10,000.

European Broadcasting Conference.—GENEVA MEETING.—At the invitation of the International Broadcasting Office, representatives of some seventy European broadcasting stations agreed to take part in the technical conference which met at Geneva on July 6th. It is hoped that this conference may discover a solution of the difficult problem of wave lengths. By courtesy of the Secretary-General of the League of Nations, the conference was held in the Palais des Nations.—*Reuter* (Geneva).

Radio on Aircraft.—DELIBERATE INTERFERENCE.—One of the most interesting features of the recent Royal Air Force Display at Hendon was the demonstration of radio-telephone equipment for formation control. This is the first time that such an exhibition has been given to the public. Compactness of apparatus is of vital importance; the Marconi A.D.5 set requires no trailing aerial, the whole of the aerial system being permanently attached to, and insulated from, the wings and fuselage of the aeroplane. The latter's power of manœuvring is thus in no way impaired and a high degree of radiation is maintained by the use of short wavelengths, which have the advantage of freedom of interference from, and with other aircraft and ground sets. The transmitter and receiver are mounted as separate units and remote control enables the apparatus to be mounted in any odd corner of the machine without interfering with the ability of the pilot to operate and adjust it when flying. The disappointing results, both to the spectators on the ground and to listeners generally, of the recent squadron drill at Hendon have been investigated by a joint conference of technical experts of the Royal Air Force and the B.B.C. It has been established that the organisation was complete and that no breakdown of apparatus occurred. There is no doubt that the trouble was due to an extremely powerful heterodyne, and the evidence suggests that this interference was deliberate, although it cannot at present be traced. The incident is the more regrettable as the Royal Air Force had announced the wave-length beforehand, and made a special appeal to the public to refrain from interfering on it.

Contracts Open and Closed.

(The date given in parentheses at the end of the paragraph indicates the issue of the "Electrical Review" in which the "Official Notice" appeared in our advertisement pages.)

Open.

Australia.—SYDNEY.—July 27th. Municipal Council. One 5,000-kVA, 5,000/33,000-V step-up transformer; supply of gas-filled lamps. Specifications from the office of the Construction Engineer, Electricity Department, Town Hall, Sydney.

Postmaster-General's Department.—Automatic c.b. telephone exchange equipment, Canberra exchange.

New South Wales Public Works Department. September 14th. Electrical equipment, machinery, &c., for bascule bridge over Cooks River at General Holmes' Drive.

September 21st. Material and apparatus for complete communication system, Barrenjack hydro-electric scheme.—*Tenders.*

MELBOURNE.—August 3rd. Electricity Commission of Victoria. Switchgear and accessories.

September 14th. 3,000-kVA transformers and spares. Particulars from the Purchasing Section of the Commission, William Street, Melbourne.

Postmaster-General's Department. August 11th. (Sched. C. 26), plugs and sleeves (switchboard). (Sched. C. 25), switchboard cords.

September 15th. Lamps lamp caps, and lamp sockets. Tender forms from High Commissioner, London.

Barking.—July 28th. Electricity and Tramways Department. One 1,000-kW and one 500-kW rotary converters, with oil-cooled transformers and synchronising panels or, alternatively, one 1,000-kW and one 500-kW motor-converters (La Cour type), with starting and synchronising panels, e.h.p. switchboard, 3-wire d.c. switchboard and traction board. (See this issue.)

Belgium.—July 22nd. Belgian Post and Telegraph authorities at La Salle Madeleine, Brussels. Supply and laying at Liége of a quantity of telephone cable, with accessories. Particulars (Cahier des Charges Special No. 3-124) for 5 fr. 30 c.

Bridgend.—July 31st. Penybont Rural District Council. Kenfig Hill electricity scheme. L.p. underground and overhead mains, transformers, switchgear, meters, and house wiring. (June 26th.)

Cardiff.—Education Committee. Electrical wiring and fittings for Council schools at Ely and Mynachdy. Specifications from the City Electrical Engineer, The Hayes, Cardiff.

Dundee.—July 17th. Electricity Department. Steam and exhaust pipes. (June 26th.)

Eccles.—July 15th. Electricity Department. 2,200-V switchboard, consisting of five feeder panels. Specification and form of tender from Borough Electrical Engineer, Electricity Works, Cawdor Street, Patricroft.

Edinburgh.—July 13th. Electricity Department. Installation of electric lighting at the public wash-house, Abbeymount, Edinburgh. Specifications from Engineer, Dewar Place.

Egypt.—CAIRO.—Inspecting Engineer in London. 3,000 metres submarine cable, underground cables, 10 tons line wire, bolts and nuts, &c.

Grimsby.—August 1st. Electricity Department. Storage battery, booster, and switchgear. (See this issue.)

Hanwell.—July 18th. Central London School District. Extension of the electric lighting installation. Specification from Mr. G. F. Morrell, clerk to the Managers, Greenford Avenue, Hanwell, W.7.

India.—SIMLA.—July 20th. Indian Stores Department. Diesel-engine alternator sets, water-cooling units, oil fuel storage tank, oil-purifier equipment, 10-ton overhead crane, switchboard, cables, transformers, e.h.p. feeder cables, &c.*

July 17th. India Store Department. Porcelain insulators. (See this issue.)

Leeds.—July 15th. Corporation. Electric lighting installation at 40, Park Lane. Particulars from Mr. W. T. Lancashire city engineer, Municipal Buildings.

July 14th. Board of Guardians. Supply of "Osram" electric lamps. Specifications from Mr. J. H. Ford, clerk to Board of Guardians, Poor Law Offices, 11, South Parade.

London.—ST. PANCRAS.—September 3rd. Electricity Department. One 10,000-kW steam turbine, alternator, condensing plant, pipes, &c. (See this issue.)

BETHNAL GREEN.—July 20th. Electricity Department. L.p. cables and switchgear. (See this issue.)

Lymm.—July 13th. Urban District Council. Electrically-driven centrifugal pump. Particulars from Mr. N. Holt, clerk to the Council, Council Offices.

Manchester.—July 16th. Board of Guardians. Electrically-driven booster pumping plant at Booth Hall Infirmary. Particulars from Mr. E. Hargreaves, Union Offices.

July 20th. Electricity Department. Electric cooking ranges, and switches and cut-outs for 12 months. (July 3rd.)

July 14th. Tramways Committee. Span wire brackets for tramway poles; copper trolley wire; copper bonds. Specifications from Mr. H. Mattinson, general manager and chief engineer, Corporation Tramways, 55, Piccadilly, Manchester.

New Zealand.—WELLINGTON.—August 18th. Posts and Telegraph Department. Switchboard plugs.*

INVERCARGILL.—Electricity Department. 2 200 ft. .1 sq. in. 11,000-V cable; 80 ft. .3 sq. in. 3,300-V cable and spares.*

August 17th. Four 667-kVA single-phase transformers.*

MARLBOROUGH.—September 22nd Electric Power Board. Turbines, generators, and switchgear. (B.X. 1,904.)*

South Africa.—JOHANNESBURG.—August 1st. Municipal Council. Twelve a.c. power relays.*

West Ham.—July 20th. Education Committee. Wiring of eight schools. (June 26th.)

*Further particulars can be obtained at the Department of Overseas Trade (Inquiry Room), 35, Old Queen Street, S.W.1.

Closed.

Australia.—SYDNEY.—City Council. Accepted:—

Double-braided weatherproof cable (£4,554).—Enfield Cable Works (Aust.), Ltd.
Service boards (£999).—G. Hudson & Sons, Ltd.
10,000-V feeder protective apparatus (£587 and £113).—Australian General Electric Co., Ltd.
5,000-V potential transformers.—Australian General Electric Co., Ltd.
A.c. consumers' meters (£15,287).—Electricity Meter Mfg. Co.

MELBOURNE.—Department of Works and Railways.

7 motors at City South Telephone Exchange, Sydney (£728).—Siemens Bros. & Co., Ltd. —*TENDERS.*

Belgium.—Belgian, Swiss, and British (Metropolitan-Vickers, Ltd.) firms submitted tenders last week to the municipal authorities of Schaerbeek, Brussels, for the supply of 112 h.p. and l.p. electricity meters. The lowest offer was that of the New Antwerp Telephone and Electrical Works Co.

Birkenhead.—Tramways Committee. Accepted:—

Electrical equipment at tramways depôt (£2,961).—British Thomson-Houston Co., Ltd.

Birmingham.—Education Committee. Accepted:—

Electric lighting installation at Billesley elementary school (£435).—R. H. Newton.

Corporation. Accepted:—

Three double-deck railless cars.—Railless, Ltd.

Burton-on-Trent.—Electricity Committee. Accepted:—

Mains (£2,885).—Johnson & Phillips, Ltd.
Switchgear (£481); switchgear and transformers (£1,605).—Ferguson, Pailin, Ltd.

Canterbury.—Town Council. Accepted—

2,300 yd. of cable (£1,897).—Western Electric Co., Ltd.

Dundee.—Corporation. Accepted:—

Electric lighting installation at 216 houses at Dudhope (£1,696).—R. Kilpatrick & Co.

Hawarden.—Rural Council. Accepted:—

Five sub-station transformers (£499).—General Electric Co., Ltd.
Switchgear (£972).—Powell Lighting Supplies Co., Ltd.

Hull.—Electricity Committee. Accepted:—

Two 7,000-kW turbo-alternators:—

	Steam Consumption. (lb. per kW hr.).	Price.
Oerlikon, Ltd.	11.20	£43,042
Escher Wyss & Co.	10.72	53,176

Telephones Committee. Switchboards:—

British L. M. Ericsson Manufacturing Co., Ltd.	(Accepted.)	**£298**
Western Electric Co., Ltd.		325
Peel-Conner Telephone Works, Ltd.		299

Lamp Contracts.—The Royal Mail Steam Packet Co. has placed a contract for a 12 months' supply of gasfilled lamps and an order for a large number of metal-filament and carbon-filament lamps with the Siemens & English Electric Lamp Co., Ltd.

The Edison Swan Electric Co., Ltd., has received an order from the Great Southern Railway of Ireland for six months' supply of electric lamps.

Leeds.—Tramways Committee. Accepted:—

50 gear wheels (£444).—National Steel Foundry (1914), Ltd.
150 pinions (£139).—W. Muir & Co., Ltd.

Electricity Committee. Accepted:—

Cables.—W. T. Henley's Telegraph Works Co., Ltd. (£7,485); Enfield Cable Works, Ltd. (£3,499); Macintosh Cable Co., Ltd. (£2,664).
Meters (£3,900).—Measurement, Ltd.

Libraries Committee. Accepted:—

Electric lighting installation, Alexander Street premises (£184).—Cloke's Extension, Ltd.

London.—ST. PANCRAS.—Electricity Committee. Recommended :—

Coal for the electricity station for eight months from August 1st :—

15,400 tons Bentinck Derby main slack, ¾ to 1 in. (22s. 5d. per ton); 7,200 tons Stanton Deep nutty slack (21s. 11d. per ton).—J. H. Beattie and Co., Ltd.

GREAT WESTERN RAILWAY CO.

Six petrol-electric mobile cranes.—Ransomes & Rapier, Ltd.

Manchester.—The City Council at its meeting last week, by 77 votes to 17, rejected the recommendation of the Tramways Committee to place a £5,000 contract for tramway track work with the United States Steel Products Co. The *Manchester Guardian* states that at one time during the discussion there seemed to be a possibility of the old fiscal controversy being reintroduced but eventually the Council took the view that the tender should not be accepted, mainly because of the unemployment in this country, and because evidence was produced to the effect that the conditions of employment in the American firm did not conform with the provisions of the Fair Contracts Clause of the Standing Orders of the Manchester Corporation. By an overwhelming majority the Tramways Committee was instructed to accept the lowest English tender for this particular work.

Oldham.—Electricity Committee. Accepted:—

Transformers.—Ferranti, Ltd.

Rotherham.—Electricity Committee. Accepted:—

250-kW transformer (£217).—General Electric Co., Ltd.

Sheffield.—Tramways Committee. Accepted:—

750 tons of tramway rails (£8,250).—Steel, Peech & Tozer, Ltd.
Copper bonds (£92).—British Insulated & Helsby Cables, Ltd.
Three 500-kVA transformers (£1,233).—British Electric Transformer Co., Ltd.
Ropeway extension at Neepsend power station (£2,145).—R. White & Sons, Ltd.

Sleaford.—Urban Council. Accepted:—

Additions to station (£849).—Banks & Son.
Switchboard (£107).—Edison Swan Electric Co., Ltd.
Oil engine (£4,960).—Premier Gas Engine Co., Ltd.
Generator (£1,450).—General Electric Co., Ltd.

South Africa.—JOHANNESBURG.—Department of Posts and Telegraphs. Accepted :—

Apparatus for automatic telephone exchange, Kloof, Natal (£1,532).—Siemens Bros & Co., Ltd.

DURBAN.—Municipal Council.

5 miles .25 sq. in., 6,600-V cable (£7,539); 1½ miles .1-in. ditto (£1,065); 1 ton bare copper wire (£90).—T. Barlow & Sons, Ltd.
10 "Falco" electric stoves and 1 bath heater, for the fire station (married quarters) (£204).—J. F. Chapman.
One 250-kVA, 3-phase transformer (£185).—Ferranti, Ltd.
1½ miles .06 sq. in. 6,600-V cable (£1,000).—R. D. Lavery & Co., Ltd.
Watt-hour meters.—Metropolitan-Vickers Electrical Co., Ltd. (£611); Vincent & Pullar, Ltd. (£392).
Two 250-kVA single-phase transformers (£414).—Vincent & Pullar, Ltd.
One telpher hoist for ash removal at power station (£785).—R. Dempster and Son, Ltd.—*South African Power Engineer.*

Notes.

Traffic Control Device.—Experiments are being made in Berlin at night with electrically-lighted street "islands," which will afford policemen on point duty a safe stand. The light is thrown upwards from the ground on to the traffic controllers so that their signals can be seen clearly from a distance, says the *Daily Mail*. In winter the "islands" will be heated.

Electrical Exhibits at the Royal Agricultural Show.—About 50 of the stands at the Royal Agricultural Show of England, which is being held at Chester this week (July 7th to 11th), are electrically equipped, energy being supplied free of charge by the Chester Corporation, to which must be given credit for having persuaded the R.A.S.E. to agree to the wiring of stands. One and a half miles of overhead transmission is employed. The Electricity Department of the Corporation has a stand where demonstrations are being given, showing the utility of electricity in the homestead and on the farm, in numerous directions. Mr. S. E. Britton, M.I.E.E., M.I.Mech.E., city electrical engineer, informed our representative that his department was "all out" to dissipate some of the prejudiced and ill-informed ideas concerning the use of electricity in agriculture. The purposes for which electric power is used on various stands at the Royal Show are :—Refrigerating, milking and milk cooling, corn grinding and milling, conveyors, ploughing, mole draining, cultivators, winnowing, barley dressing, seed cleaning, churning and separators, thrashing machinery, water pumping, pasteurising, barn machinery, bottle washing, bacon slicing, oil refining, heating and driving linotype machinery, crop drying, lighting, heating, fans, and for general purposes. On Wednesday morning (July 8th) there was to be an Electro-Farming Conference, at which Lord Bledisloe, K.B.E., was to preside, and Sir E. John Russell, D.Sc., F.R.S., was to deliver a speech from the point of view of the agriculturist. Mr. S. E. Britton and Mr. R. Borlase Matthews were also down to speak on the practical applications of electricity to agriculture.

Fire.—On July 6th, the premises of the Brighton Supply Stores, Gloucester Road, Brighton, were badly damaged by fire and water. The shop was stocked with electrical and radio accessories.

Appointments Vacant.—Fitter-Driver (67s. 3d.), for Severalls Mental Hospital, Colchester. Lady Demonstrator (£182) for the Borough of Cheltenham electricity department. Charge Engineer for the St. Helens Corporation electricity department. Charge Engineer for the Stalybridge, Hyde, Mossley, and Dukinfield Tramways and Electricity Board. Meter Tester and Repairer for the Eastbourne Corporation Electricity Department. Junior Draughtsman for the Cardiff Corporation Electricity Department. Junior Electrical Testing Assistant for Salford Borough Council Electricity Department.

Transformer Oil Problems.—The American National Electric Light Association's 1925 Electrical Apparatus Committee has reported that some difficulties have been experienced through the congealing of oil in transformers that have been subjected to extremely low temperatures, and a few examples are cited in *Power*. Freezing in the pipe connection between the transformer and the conservator tank has occurred in several cases, and a remedy has been found in covering the pipes with a heavy lagging of heat insulating material which in some cases has been supplemented with a small electric heater. In one case the temperature of the transformer was noticed to rise, due apparently to the oil congealing and impeding the circulation through the radiators; after applying external heat for a short time to the lower end of the radiators, free circulation was established and the transformer temperature reduced. A case of the sludging of transformer oil is also reported; investigations indicated that the deterioration of oil varied considerably with transformers of different make, but the possible causes have not yet been determined. The causes of the deterioration of oil for use in transformers and oil circuit breakers are engaging the serious attention of several manufacturers of equipment for filtering and cleaning oil. In addition to the well-known methods, using blotter filters and centrifugal separators, other methods, involving supplementary treatment, are being tried in which certain reagents are introduced into the oil to absorb impurities, and separated out again, leaving a clean oil.

Coosa River Hydro Project. — According to *Power*, the Alabama Power Co. has filed an application with the Federal Power Commission for licence to build a hydro-electric power dam on the Coosa River 15 miles above Montgomery, Ala. It proposes to complete the scheme within three years, commencing in December next. The dam is to be 90 ft. high with an initial installation of 72,000 h.p., estimated to cost $13,500,000. It will complete about 65 miles of navigation pool created by the power dams of this company on the 116-mile non-navigable stretch of the Coosa River between Gadsden and Montgomery. The pools submerge several small low locks and dams built by the Government more than a third of a century ago to improve navigation, but which have long since been abandoned.

A Substitute for the Liquid-air Trap for Mercury Vapour.—In an interesting letter published in *Nature* of June 27th, Messrs. A. Ll. Hughes and F. E. Poindexter, of Washington University, U.S.A., refer to the disadvantages of the liquid-air trap for mercury vapour in the mercury vapour condensation pump, and state that in the course of a search for an alternative method of trapping mercury vapour, they have found that the alkali metals have an extraordinary power of absorbing mercury vapour. Their practice is to put a small piece of sodium or potassium into a trap between the diffusion pump and the apparatus to be exhausted, and to distil it, after the vacuum has been obtained, on to the sides of the trap, thus lining it with the metal for a few centimetres. Using an ionisation gauge for the vessel to be exhausted, they have found that the pressure of mercury vapour in it with a potassium-lined trap between it and the pump is certainly less than 5×10^{-9} mm. By making direct comparisons between the trapping power of a potassium-lined tube and that of the usual liquid-air trap, the same ionisation gauge measuring the pressure reduction, they have found that the potassium-lined trap is quite as satisfactory as liquid air. The residual pressures obtained in various tests seemed to depend entirely upon the vigour with which the ionisation gauge and connecting tubes were outgassed by heat treatment before the measurements were made, and not at all upon whether liquid air or metallic potassium was used to trap the mercury. In one test, in which sodium was the active metal, the pressure in the ionisation gauge beyond the trap after 25 days was within 50 per cent. of its initial value (2×10^{-7} mm.).

In a second test, they used the first appearance of mercury lines in the spectrum of helium, at less than 0.01 mm. pressure, as a criterion of the diminution of the trapping power of a potassium-lined trap for mercury vapour. The mercury lines did not appear until the eleventh week, in which time the potassium had absorbed a little more than 150 per cent. of its own weight of mercury.

Report on a Nottingham Breakdown.—A recent dislocation of the Nottingham electricity supply, involving an entire stoppage throughout one day of the tramways and the partial holding up of the supply for illuminating and general motive purposes, formed the subject of reference at a meeting of the City Council on July 6th, when Alderman E. Huntsman, chairman of the Electricity Committee, explained that investigations as to the firing of the cables at the St. Ann's Well Road generating station, which was the cause of the mischief, showed that the outbreak did not originate through electrical

defects. It had been mistakenly conjectured that it was due to the overloading of some of the cables from the station into the general system. That erroneous idea was, however, discounted by the fact that a minute examination of the copper conductor disclosed no traces of fusion or melting. The fire happened early in the morning, when the load was well below the normal. An official sent down by the Board of Trade and a representative of Messrs. Callender's Cable and Construction Co., Ltd., who were doing work for the Corporation in connection with the extension of the present system, had participated in making independent investigations, with the result that they coincided in the view that the cause of the fire was not electrical. The cables were in a subway, and at this time of the year, and with a certain temperature in the cables themselves, everything was abnormally dry. The only possible explanation of the affair was that possibly a match or a cigarette end thrown through a ventilating aperture in the subway fell on one of the cables. There was a tendency to draught in the subway, and when one cable burnt, the others were soon alight. That, Alderman Huntsman concluded, was the only possible explanation of the whole trouble.

Cheap Electricity Promised. — Speaking at Bradford recently, Lieutenant-Colonel Moore-Brabazon, Parliamentary Secretary to the Ministry of Transport, said he hoped that if a Bill to be introduced in the autumn was passed this country would have electricity cheaper than anywhere else. With its coal-reserve England was one of the best countries in the world for the cheap generation of electricity, which meant so much to an industrial nation.—*The Times.*

A Tasmanian Appointment.—A newspaper report just to hand, and dated May 16th, states that 12 applications were received for the position of general manager and chief engineer of the Tasmanian Hydro-Electric Department. Eleven came from within Tasmania and the mainland, and one from South Africa. The position carries a salary of £1,250 a year, with an annual increase of £50, to a maximum of £1,500. The Cabinet was to consider the applications.

Transport of a Large Stator.—A new M.V. stator for the 25,000-kW generator at Lister Drive power station, Liverpool, has recently been delivered. Weighing 91 tons, this was sent by road from Manchester, being hauled on a specially built bogie weighing 16 tons, by three large road tractors. Thus the total load was 107 tons. The journey of 40 miles occupied fifteen hours' travelling time.

The Contractor and Electric Farming.—In his speech at this year's annual dinner of the Electrical Contractors' Association, Mr. W. Riggs, the president, made reference to the opportunities which would be presented to contractors when rural electrification was seriously undertaken in this country.

In preparing for this the contractor must bear in mind that the class of work which he will have to undertake has many aspects which are absent from other installation work, but should be given the fullest consideration to ensure complete satisfaction with electrical methods. Some of these points are dealt with in an article which recently appeared in *The Electragist* (the United States contractor-dealers' organ) and they seem to be worthy of reproduction. The general remoteness of farms from any contractor's premises and from a fire station makes it imperative that installations shall be as free as it is humanly possible to make them from interruptions and fire risks. This should always be the aim, of course, but it may be necessary in the case of rural installations to take extraordinary precautions. In barns there is always a danger of wires being gnawed by rats and our American contemporary suggests the use of an all-metal system of the flexible or conduit types. Much of the outside work on the farm will be done by a single portable motor which will have a wide range to cover. Efforts should therefore be made to provide a large number of plug-in points to obviate the use of great lengths of cable. The rearrangement of farm machinery may be suggested, as the bringing of as much of it as possible into a small area will save a great deal of wiring.

It is worth the while of any contractor to obtain diagrams of several typical farm buildings in his area and if he is not already thoroughly acquainted with working conditions on farms, to learn what they are. So seemingly unimportant a matter as the position of a switch with reference to a stable door, the stalls and the runway, may be a matter of considerable importance to the farmer. Farm wiring systems should be planned with the thought in mind that, eventually, power will be obtained from a rural distribution line even where the establishment has its own small power plant. It should also be remembered that the use of electricity for some farm processes will almost inevitably lead to its use for other purposes and preparation should be made for such extensions to facilitate them when they are called for. It is also fair to assume that many of the heavier electrically-driven machines, such as thrashers, hay balers, &c., will be taken from farm to farm. Provision should be made for attaching them most conveniently and efficiently.

After pointing out the benefits which will accrue from the electrification of farms, the writer says that the contractor will play an important part in furthering the business. "More than this, he will do much to promote or retard it by the kind of work he does, which will involve careful planning the best of workmanship, and the use of quality materials."

Staveley Coal Co.'s New Plant.—The Staveley Coal and Iron Company has installed what is said to be the largest gas engine in the country for the purpose of increasing its output of electricity, and this was recently set in motion. The new engine is operated by waste gas from the blast furnaces, and generates sufficient energy to supply the district within a 30-mile radius. The company owns about 10,000 houses, most of which are supplied with electricity on the weekly payment system.

H.p. Pirelli Cable for New York.—We learn from *Power* that a new underground 132,000-V cable of the Pirelli type, the patent rights on which were recently secured by the American G.E.C. from the Italian electrical firm, is about to be installed in the Bronx for the New York Edison Co. This new line, costing about $2,500,000, will be used to link up the generating stations of the New York Edison Co. and its allied companies, which is calculated to render available 120,000 h.p. additional for this section. The new cable, which will be only 3 in. in diameter, will be placed in concrete ducts four or five feet deep. It is said that it will be the highest-pressure cable ever installed in America and probably in the world.

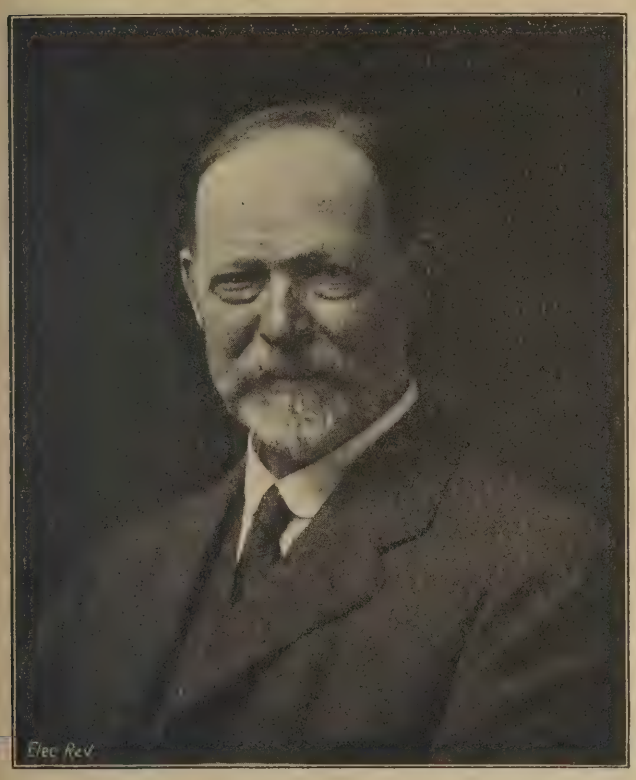
Institution Notes.

Institution of Electrical Engineers.—CONVERSAZIONE.—On Thursday last week the annual conversazione of the Institution was held at the Natural History Museum, South Kensington, London, the guests being received by the President, Mr. W. B. Woodhouse, and Mrs. Woodhouse, with members of the Council. Music was provided by the string band of the Royal Engineers under Lieut. Neville Flux, F.R.A.M., and a concert was given by the Gresham Singers and other artistes. There was a large attendance, though not quite so many were present as there were last year, fewer members from provincial Centres being met with on this occasion. The arrangements were as usual admirably organised, and the function was very enjoyable. The central hall was lighted with powerful gasfilled lamps, and although these were at a considerable height the fact that they were wholly unscreened was unpleasantly noticeable; doubtless the Institution was in no way responsible for this lapse from good practice, but the lamps must have been fixed by someone professing to be an electrician, and the attention of the Trustees might well be drawn to the crudity of the method adopted. In the West Wing very appropriate fittings have been installed.

Association of Mining Electrical Engineers.—It is necessary to correct some of the statements contained in the report which appeared under the above heading in our issue of June 26th. The meeting referred to as the summer meeting was the annual general meeting of the Association, held in Cardiff at the invitation of the South Wales branch. It should also be noted that Mr. Theodore Stretton is the new president of the Association, who with the vice-presidents, Messrs. D. Martin, O.B.E., and G. M. Harvey, and the hon. treasurer, Mr. Alex. Anderson, was elected at the meeting. The meeting at which Major David's paper was discussed was a joint meeting of the Association of Mining Electrical Engineers, the Western Centre of the I.E.E., and the South Wales Institute of Engineers. This meeting was presided over by Mr. Spence Thomas, president of the South Wales Institute of Engineers, who was supported by Mr. Theodore Stretton and by Mr. A. C. MacWhirter, past chairman of the Western Centre of the I.E.E. The dinner held at the Park Hotel was the Association's annual dinner.

Our Personal Column.

(Electrical men are invited to enable us to keep readers of the "Electrical Review" posted concerning their movements).



On the motion of Alderman Aspinall, a resolution of Bolton Tramways Committee raising the salaries of the tramway manager and two of his staff by two years' increments instead of one, was defeated at a recent Town Council meeting.

Mr. HUGH CASEY, on his retirement on pension from the chief collectorship of the Londonderry Corporation Electricity Department, has been presented with a wallet of Treasury notes.

The honorary degree of Doctor of Laws has been conferred upon Mr. SAMUEL INSULL, president of the Commonwealth Edison Co., of Chicago, by the North-West University. The *Electrical World* records the following tribute paid to him by the Dean:—"Pioneer in public utility development, president and moving spirit of the Chicago Civic Opera Company, trustee of St. Luke's Hospital and active worker in its behalf, chairman of the Illinois State Council of Defence, patron of music, humanitarian and public-spirited citizen, a leader in civic and industrial progress."

Messrs. Vickers, Ltd., Naval Construction Works, Barrow, announce that Mr. G. W. JACKSON, Mr. W. E. PRICHARD, and Mr. J. CALLANDER, have been appointed special directors of the company. Mr. Jackson and Mr. Pritchard are at the head of the commercial department of the Barrow establishment, and Mr. Callander was recently appointed general manager of the engineering departments.

The president of the International Congress of Radiology which was held in London last week is Mr. CHARLES THURSTON HOLLAND, C.L., Ch.M. Mr. Holland, whose portrait accompanies this note, is one of the leading British radiologists, and

Mr. C. Thurston Holland, D.L., Ch.M.
President of the International Congress of Radiology.

he was one of the pioneers of X-ray work, having commenced the study and practice of the subject in 1896. He was an original member of the Röntgen Society, of which he has twice been president.

Among the distinguished foreign delegates to the Congress was M. LE DUC DE BROGLIE, who has for a number of years taken a leading part in physical research in France. He is well known in this country having been connected, as French representative, with the Admiralty Inventions Board during the war. He has read papers before the British Association and other British scientific bodies, is an honorary member of the Royal Institution of Great Britain, and a doctor, *honoris causâ*, of the Oxford and Leeds Universities. The Duc de Broglie delivered the eighth Silvanus Thompson Memorial Lecture on July 1st.

At the Helsby offices of the British Insulated & Helsby Cables, Ltd., last week, Mr. H. HARDING, a member of the technical staff was presented with a leather suit-case, subscribed for by his colleagues on the technical staff. He is taking up a position on the Prescot works contract staff. The presentation was made by Mr. W. J. Britland.

The daily Press is informed that the head of the Wireless Research Laboratories of the Royal Air Force, Dr. JAMES ROBINSON, has tendered his resignation to the Air Ministry, in order to take up the post of Director of Research to the group of periodicals produced by the Radio Press, Ltd. Dr. Robinson received a large sum for his war inventions from the Royal Commission on Awards to Inventors, his radio navigating apparatus for aeroplanes being used in the Royal Air Force.

Mr. Z. H. KINGDON, who has been superintending electrical engineer at Devonport since 1908, and was recently awarded the O.B.E., is about to retire. He will be succeeded by Mr. H. F. HUNT, superintending electrical engineer at Rosyth Dockyard. Since Mr. Kingdon took up his post at Devonport Dockyard the electrical staff has increased from 450 to 1,300.

At a gathering of all grades of the electrical department at Devonport Dockyard on Friday last, a presentation was made to Mr. KINGDON, in the form of a grandfather clock. Mr. E. E. Benham, senior electrical engineer, expressed the regret of all at parting with Mr. Kingdon, who was appointed 17 years ago and had set before them a very high standard of personal duty. Mr. H. Simpson, representing the skilled labourers, spoke of Mr. Kingdon's ready sympathy with them at all times. Tributes to the retiring chief were also paid by Messrs. W. J. Wooton, who presided; W. McClelland, Director of Electrical Engineering, on behalf of the Admiralty staffs, and several other colleagues and Mr. Kingdon, in reply, said that their aim as fellow workers was to keep the Navy efficient, and the position the department now held was due more to those who helped him than to himself. He then introduced to the gathering his successor, Mr. Hunt. A gold anchor brooch and a bouquet were presented to Miss Kingdon.

With reference to the appointments of Messrs. H. C. LAMB and H. A. RATCLIFFE as chief engineer and manager, and deputy chief engineer at Manchester, the Council, in confirming the recommendations of the Establishment Committee, which were given on p. 27 of our last issue, altered the salaries to £2,000 and £1,150 respectively. The Electricity Committee has placed on record its high appreciation of the services of Mr. S. L. PEARCE, extended over a period of 24 years, and while regretting its loss "is not unmindful of the high honour conferred upon the Manchester Corporation" by the Government in asking Mr. Pearce to become an Electricity Commissioner. An Australian newspaper recently to hand quotes from a letter written by Mr. Pearce expressing regret that the Sydney City Council has decided to disregard his recommendation in respect of the agreement with the Railway Commissioners and the new power house and hoping that some means may be found of averting what he would regard "as a disaster both for the City and the State."

Mr. JOHN RICHARDSON has been appointed working electrical engineer under the electricity scheme of the Hawarden Rural District Council. There were 290 applicants from whom a short list of three was selected to appear before the Council.

Mr. E. C. WANSBROUGH having relinquished the secretaryship of the Electrical Accessories Manufacturers' Association, all correspondence should for the present be addressed to Mr. J. N. Stephens, the chairman of the Association, at 39, St. James's Street, S.W.1.

Mr. R. S. HERBERT, assistant mains engineer, Oldham Corporation electricity department, has resigned to accept an appointment in Singapore.

When the Birmingham Tramways Department's Social Athletic and Thrift Society celebrated its coming-of-age at the Town Hall on July 1st, Mr. ALFRED BAKER, the manager of the department, who has been president of the Society since its formation 21 years ago, was presented with a model omnibus, oxidised finish and having silver panels for windows. The upper half of the model takes the form of a cigarette box.

The Oldham Town Council has been recommended by the Tramways Committee to grant the following increases of salary:—Mr. J. F. RICHARDS, works superintendent, from £300 per annum, plus £85 7s. 4d. bonus, to £350, plus the same bonus; Mr. J. S. SMITH chief cashier, from £221 per annum, plus £71 18s. 8d. bonus, to £271, with the same bonus; Mr. M. MULLIN, traffic superintendent, from £276 per annum, plus £38 bonus, to £326 per annum, plus the same bonus.

The Staffing Sub-Committee of the Crewe Town Council recommended that the salary of Mr. DENTON, electrical engineer, be in accordance with the scale fixed by the Association, less 5 per cent. reduction. This would advance him from £660 per annum, less 5 per cent., to £725 per annum, less 5 per cent. The General Purposes Committee has, however, by the chairman's casting vote, referred the matter back for further consideration.

Worcester Corporation Electricity Committee recommends that the salary of Mr. SHAW, the chief electrical engineer, be increased to £1,000.

Dr. T. F. WALL has been appointed head of the electrical engineering department in the University of Sheffield.

On Tuesday afternoon, in the Lord Mayor's Parlour, at the Town Hall, Manchester, a public presentation was made to Mr. S. L. PEARCE, on the occasion of his vacating the various offices which he has held apart from his Manchester position.

Mr. W. CHAMBERLAIN, late tramway manager and engineer at Oldham, who has left for Leeds, has been presented by the chief officials of the Oldham Corporation with a piece of silver plate.

We are asked to state that Mr. A. G. M. MICHELL, of Michell Bearings, Ltd., Crankless Engines, Ltd., and Crankless (European Patents) Proprietary, Ltd., has recently arrived from Australia, and has opened an office at 20, Grosvenor Gardens, London, S.W.1.

In our "Lighting and Power" Note under Dover last week we inadvertently gave the name of the engineer as Mr. H. D. Munro. We regret the error. Mr. R. C. HARPUR, A.M.I.E.E., is borough electrical engineer at Dover.

Obituary.—MR. E. W. ROBINSON.—We regret to record the death which occurred in hospital of enteric fever, on June 24th, of Mr. Erik Watney Robinson, of Kingston-on-Thames. Mr. Robinson, who was the youngest son of the late Mr. Mark Robinson (Willans & Robinson, Ltd.), was 37 years of age. He was an electrical engineer with a London firm. At the outbreak of war he enlisted in the Grenadier Guards and later he was given a commission in the Royal Worcester Regiment.

MR. W. FINNERTY.—*The Times* records the death, which occurred on July 3rd, at Cherbourg, France, of Mr. William Finnerty, of Bedford Park, "for many years with the International General Electric Co. of New York."

Wills.—The late MR. ARTHUR JACOB left £2,201 net and £4,465 gross personalty.

Mr. W. SEYMOUR, electrical engineer (W. Seymour & Co. London, S.W.), left £2,299 net and £5,620 gross personalty.

New Companies Registered.

New Wilson Electrical Manufacturing Co., Ltd. (206,993).—Private company. Registered July 1st. Capital, £500 in 400 12½ per cent. cumulative preference shares of £1 each and 2,000 ordinary shares of 1s. each. Objects: To acquire from C. F. Adolph and Winifred Bryce-Wilson letters patent and provisional protections Nos. 8,574/25 and 13,516/25 for valveless amplifiers for crystal wireless sets and any secret or other information, process or formula of the said C. F. Adolph, &c. The directors are:—Brig.-General O. K. Chance (permanent director and chairman), Rothmans, Great Baddow, Essex (sales manager to British Cyanides Co., Ltd.); Mrs. Winifred Bryce-Wilson, 41, Denbigh Street, Victoria, S.W.; M. Stephany, 68, Melrose Avenue, Cricklewood, N.W.2. Qualification, £1. Solicitors: Peacock & Goddard, 3, South Square, Gray's Inn, W.C.1. Registered office: 65/6, Basinghall Street, E.C.2.

Lincoln Wireless Co., Ltd. (207,015).—Private company. Registered July 2nd. Capital, £1,200 in £1 shares. Objects: To carry on the business of manufacturers of and dealers in wireless telegraphic and telephonic apparatus, valves, instruments, equipment, accessories, electrical, X-ray, magnetic and radioactive instruments and apparatus, &c. The directors are:—R. H. Harrison, 79, Newland Street West, Lincoln, wireless engineer; O. H. Waterton, 19, Tennyson Street, Lincoln, wireless engineer; H. Waterton, 19, Tennyson Street, Lincoln, tailor. Qualification, 25 shares. Remuneration as fixed by the company. Secretary: R. H. Harrison. Solicitors: Langley, Stevens & Phillips, 34, Silver Street, Lincoln. Registered office: 30, Newland Street West, Lincoln.

O. S. Choppin & Co., Ltd. (207,018).—Private company. Registered July 2nd. Capital, £1,000 in £1 shares. Objects: To acquire the business of electrical engineers carried on by O. S. Choppin & Co., at 41, Lower Belgrave Street, S.W.1. The first directors are: O. S. Choppin, Oakwood, Herne Bay Road, Whitstable, electrical engineer; M. C. Creswell, 45, Hillcourt Road, East Dulwich, S.E.22, electrical engineer. O. S. Choppin is permanent governing director subject to holding 500 shares. Solicitors: Doyle, Devonshire & Co., 14, Bedford Row, W.C. Registered office: 41, Lower Belgrave Street, S.W.1.

Official Returns of Electrical Companies.

Henry Joseph & Co., Ltd.—R. G. Sidford, of 36, Southampton Street, Strand, W.C., was appointed receiver on June 18th, 1925, under powers contained in debentures dated May 16th, 1924.

Electrical Insulating Composition Co., Ltd.—J. Lucas, of 26, Lirley Street, Blackpool, incorporated accountant, was appointed receiver on June 19th, 1925, under powers contained in debenture dated September 10th, 1924.

E. S. Company, Ltd.—B. A. Smith, F.C.A., of 11, Queen Victoria Street, was appointed receiver and manager on June 26th, 1925, under powers contained in first mortgage debenture dated November 17th, 1920.

Dawlish Electric Light and Power Co., Ltd.—Satisfaction to the further extent of £500 (balance) on May 25th, 1925, of mortgage debenture dated September 24th, 1920, securing £2,000.

Néon Lights (1923), Ltd.—Satisfaction in full on June 3rd, 1925, of debenture dated October 30th, 1924, securing £1,500.

Debenture dated June 17th, 1925, to secure £1,500, charged on the company's undertaking and property, present and future, including uncalled capital. Holder: Major T. G. Pollock, 2, South Parade, Southsea.

Sudan Light and Power Co., Ltd.—A trust deed dated June 20th, 1925, to secure £400,000 debenture stock and all sums paid by the guarantors thereof, charged on the benefit of two agreements dated January 10th, 1925, with Lt.-Col. Schuster, C.B.E., M.C., and moneys payable thereunder and the company's undertaking and property, present and future, including uncalled capital, has been registered. The trustees are: Debenture Corporation, 4, Walbrook, E.C. The guarantors are: Commissioners of H.M. Treasury.

Orling's Telegraph Instruments Syndicate, Ltd.—Issue on June 17th, 1925, of £25 debentures, part of a series already registered.

W. R. Harding & Co., Ltd.—Debenture dated June 12th, 1925, to secure £325, charged on the company's property, present and future, including uncalled capital. Holder: Business Investments, Ltd., 172, Bishopsgate, E.C.2.

Rushden and District Electric Supply Co., Ltd.—Satisfaction in full on June 15th, 1925, of two charges, dated March 28th, 1914, and January 10th, 1921, securing all moneys due or to become due from the company to the Northamptonshire Union Bank, Ltd. (now the National Provincial Bank, Ltd.).

City Notes.

Reports and Meetings of Electrical Companies; Dividend Results, &c.

Kalgoorlie Electric Power and Lighting Corporation, Ltd.

The annual meeting of this company was held on July 2nd. Mr. G. C. Howard who presided, in moving the adoption of the report and accounts (*vide* our last issue, p. 29), said that the balance was much greater than that of the preceding year. The item "Properties, buildings and plant," had been increased by £16,200, representing the cost of a 1,000-kW Belliss & Morcom turbo-generator. This new set was put into operation in February last and was running well and justifying its cost. The plant would probably be fully loaded by the end of the current year and the installation of a further set was under consideration. Their manager, Mr. Marmion, had given evidence before a Commission which the Government had appointed to investigate mining conditions in Kalgoorlie with a view to possible improvements. He had promised that the company would extend its plant to enable the mines to draw their whole power requirements from it at an economical cost. The Commission had recommended the amalgamation of the seven existing mines and the scrapping of obsolete plant. The use of central power and treatment plants was advocated. It was stated that if those recommendations were carried into effect the field might be worked profitably for another 25 years. While the last estimate might be optimistic, the chairman said that it would be the company's future policy to bring down costs to the utmost.

Ward and Goldstone, Ltd.

The report for the year ended March 31st, 1925, shows a net profit of £21,939, of which, it is estimated, income tax and Corporation profits tax will absorb £4,964, leaving £16,975, plus £12,587, the balance brought forward, making £29,562. Interim dividends already paid are:—Preference, at 7 per cent. per annum, £4,340; ordinary, at 7 per cent. per annum, £2,985. It is now proposed to pay a final dividend of 4 per cent. on the ordinary shares, making 11 per cent. for the year (£1,760); and a participating dividend of 1 per cent. on the cumulative preference shares, making 8 per cent. for the year (£640), leaving £19,837 to be carried forward.

The directors have disposed of such of the industrial investments as were negotiable at a profit, and the proceeds have been reinvested in Government securities. £7,500 which stood in the books as a reserve for depreciation on shares has now been allocated to extinguishing the book value of all the remaining industrial shares to a nominal sum, although the directors consider that there is still some value attaching to them. The volume of turnover during the year under review exceeded that of the previous year. Owing, however, to keen competition the margin of profit was reduced. The applications of electricity continue to expand, necessiting additions to plant, and building extensions are in progress. It is anticipated that the extensions will be in operation by the end of the year.

"Underground" Railway Dividends.

The members of the London "Underground" group have declared the following dividends in respect of the six months ended June 30th:—

Underground Electric Railways Co. of London.—3 per cent. on the 6 per cent. first cumulative income debenture stock and 3 per cent. (free of tax) on the income bonds, as in 1924.

Metropolitan District Railway.—2 per cent. on the 4 per cent. guaranteed stock; 2¼ per cent. on the 4½ per cent. first preference stock; 2½ per cent. on the 5 per cent. second preference stock; and 1½ per cent. on the ordinary stock, as in 1924.

London Electric Railway.—2 per cent. on the 4 per cent. preference stock; and 1¾ per cent. on the consolidated ordinary stock (as compared with 2 per cent. last year).

City and South London Railway.—2½ per cent. on the 5 per cent. preference stocks; and 1½ per cent. on the consolidated ordinary stock (as against 2 per cent. in 1924).

Central London Railway.—2 per cent. on the undivided ordinary stock; and 2 per cent. on the preferred ordinary stock (both unchanged).

No interim dividend is being paid by the *Associated Equipment Co.*

Chili Telephone Co., Ltd.

The directors' report for the year ended March 31st last states that the gross revenue was £185,222, and the profit £42,599. With the addition of £3,816 brought forward, the amount available was £46,415. It was proposed to place £10,500 to the reserve for the renewal of plant; to pay a final dividend of 2s. per share free of tax (making 5 per cent., free of tax, for the year); and to carry forward a balance of £3,095. The provision for plant renewal is necessitated by the heavy expenditure on new plant entailed by the company's concession. Negotiations with the Chilian Government are in progress for an increase in the company's tariffs in order to produce the minimum return on the capital specified in the new concession. In January last the capital of the company was increased to £750,000 by the issue of 31,200 shares of £5 each. None of these shares was taken up by the Chilian public. The exchange value of the peso showed a further decline during the year. The meeting was to be held yesterday (Thursday).

Edmundsons' Electricity Corporation, Ltd.—The directors' report for the year ended March 31st, 1925, states that after providing for income tax, debenture stock charges, and expenses of the ordinary share issue, the net profit amounts to £74,784, as compared with £58,360 for the previous year. With the balance of £16,375 brought forward, the total profit becomes £91,160. Deducting therefrom the interim dividends of 3½ per cent. paid upon the cumulative preference shares and 3 per cent. upon the ordinary shares, there remains a balance of £65,160. It is proposed to carry £20,000 to reserve; a final dividend of 3½ per cent. upon the cumulative preference shares, making 7 per cent. for the year, requires £14,000; a final dividend of 4 per cent. upon the ordinary shares, making 7 per cent. for the year, requires £16,000, leaving £15,160 to be carried forward. Meeting: July 14th.

Prospectus.—*The County of London Electric Supply Co., Ltd.*—The subscription list opened on July 2nd and closed on the same day in the issue of 2,000,000 six per cent. cumulative preference shares of £1 each at £1 0s. 6d. per share. The purpose of the issue was to provide funds for the repayment of the £1,500,000 five and a half per cent. one year bearer notes and for the general business of the company. Applications by debenture stockholders and preference and ordinary shareholders were to receive special consideration. The prospectus stated that the net profits for 1924, after providing for all fixed charges, were sufficient to cover the dividend on the preference shares then issued and on the present issue of 2,000,000 shares more than 3¼ times over.

Crompton & Co., Ltd.—The report for the year ended March 31st last, which was to be presented at yesterday's meeting, recorded a net profit of £20,317 and the addition of £1 458 brought forward made available £21,775. After the payment of the preference dividend a balance of £11,927 is carried forward. The last distribution upon the ordinary shares was 5 per cent. in respect of the year 1921-22.

W. & T. Avery, Ltd.—The balance at the credit of the revenue account for the past year is £121,502, and the disposable surplus £94,096. It is proposed to pay a final dividend of 10 per cent. on the ordinary shares (making 15 per cent. for the year), to transfer £10,000 to reserve, and to carry forward £43,572.

Stock Exchange Notices.—The undermentioned have been ordered to be officially quoted :—

Newcastle-upon-Tyne Electric Supply Co.—465,000 ordinary shares of £1 each, fully paid, Nos. 1,297,682 to 1,762,681.

Shropshire, Worcestershire and Staffordshire Electric Power Co.—150,000 6 per cent. cumulative preference shares of £1 each, fully paid, Nos. 450,001 to 600,000.

United River Plate Telephone Co.—112,000 ordinary shares of £5 each, fully paid, Nos. 648,001 to 760,000.

Victoria Falls and Transvaal Power Co., Ltd.—A final dividend of 1 per cent., making 10 per cent. for 1924, has been declared on the preference shares, and one of 3 per cent. for the first half of 1925 is also to be paid. The final dividend on the ordinary shares for 1924 is 9½ per cent., making 12½ per cent. for the year.

Companies Struck Off the Register.—The names of the undermentioned companies have been struck off the Register, and they are thereby dissolved :—

Central Electrical Engineering Co., Ltd.
Northern Electrical Manufacturing Co., Ltd.

New Indian Company.—A new company has lately been formed at Barsi Bombay, with a capital of 1,500,000 rupees and the title the Shri Bhawami Marathal Mills and Electricity Supply Co. to carry on a cotton mill and to also act as suppliers of electricity.

Tilling-Stevens Motors, Ltd.—On June 30th, Mr. Justice Eve confirmed the reduction of the company's capital by £204,000 by the writing down of the value of the £1 ordinary shares to 8s. The preference shares are not to be reduced in value, but certain arrears of dividend are to be given up.

Notting Hill Electric Lighting Co., Ltd.—An interim dividend of 4s. per share, free of tax, has been declared on the deferred shares.

Traction and Power Securities Co., Ltd.—Interim dividends of 2½ per cent. on the preference stock and 4 per cent., less tax, on the ordinary stock have been declared

Telegraph Construction and Maintenance Co., Ltd.—An interim dividend of 6s. per share, free of tax, is announced.

Stocks and Shares.

MONDAY EVENING.

FEW of the markets in the Stock Exchange can claim anything approaching activity. It would almost appear as though the advent of summer weather had already made its seasonal effect felt upon business enterprise. In addition, however, there are various elements at home and abroad that arouse caution in the minds not only of the speculator but of the investor. Industrial conditions certainly do not make for hopefulness as regards the immediate future. As is generally the case when home business is quiet and foreign politics are disturbed, money turns to gilt-edged securities in order to seek, at least, temporary employment. Latterly the outpouring of new stocks has been so fast as to bring about a state of financial indigestion that requires time for its tranquilising, and prices therefore are inclined to hug the dull side. Good stock, nevertheless, is being steadily absorbed.

The only market in which real animation prevails is that for rubber shares, where the strength of the price of the raw material continues to act as a magnet for the attraction of money in large as well as in small amounts. The first batch of Home Railway dividends in respect of the half-year just ended is that of the Underground group, and it must be confessed that the results are not up to expectations. Home Railways as a whole are flat. Material falls occurred to-day, Monday, upon a comparatively slight pressure to sell.

The London Electric and City & South London are both paying reduced dividends as compared with a year ago, the ordinary stock of the former receiving 1¾ per cent. and of the latter 1½ per cent., against 2 per cent. in both cases in July, 1924. No changes are recorded in the cases of the District's 1½ per cent., the Central London 2 per cent., London General Omnibus 3 per cent., and Underground Electric Railways 3 per cent. on the income bonds, the last two being free of tax. The announcements had no particular effect upon the market, though Districts gave way 1 to 47¼. At the present rate, it will be noticed that Districts pay seven guineas per cent., and Metropolitan a little over 7 per cent. on the money. Underground Electric income bonds yield 6¼ per cent. free of tax, which is equivalent to 7½ per cent. taking tax at 4s. in the £. The electrification of the Southern Railway proceeds apace; this week, Guildford is celebrating the advent of an augmented service of trains now that the electrified portion has extended to its town.

The home electricity market received a good advertisement from the success achieved by the County of London company's offer of two million 6 per new preference shares at 20s. 6d. The subscription lists were open for only a few hours. This is a somewhat remarkable achievement, in that gilt-edged stocks are as a rule heavy and there has been a good deal of under-subscription during the past few weeks in the cases of the best-class securities. The County Company is fortunate in having won the confidence of investors to such an extent that, had the directors wished it, they could have secured, several times over, subscription to the new shares. The allotment letters will be out this week, and it is probable that the price will start at a small premium. Meanwhile, the existing preference remain at 22s. 6d., and the ordinary suffered another small loss at 2⅝, on sales by a few people who have been able to take substantial profits and have converted these into cash with the idea of taking up the new preferences. The St. James's & Pall Mall Electric has declared an interim dividend of 5s. per share on the ordinary, payable on the 1st of next month. This is the same rate as that distributed a year ago. Midland Counties eased off to 23s. 3d. North Metropolitan shed sixpence.

Whitehall Electric pref. drooped to 19s. 6d. on the slight contraction of profits shown by the last report. The debentures, however, are well maintained at 97½, at which price they would appear to be a sound investment with an element of speculation attached. The yield is £6 3s. per cent. on the money, and interest is payable in April and October.

There is a moderate amount of Tokyo Electric 6 per cent. on offer at 86, giving a return of practically 7 per cent. on the money; or, allowing for redemption by 1948, 7¼ per cent. The price is ex the June interest, and according to the last available figures, the interest on this issue was covered ten times over. It is scarcely necessary to refer to the factor of speculation which attaches to anything Japanese by reason of the natural convulsions to which Japan is subject. Barcelona Traction 6½ per cent. prior-lien bonds can be bought at 88, paying 7⅜ per cent., and amongst other foreign speculative investments it may be mentioned that Anglo-Argentine Tramways 5 per cent. debenture stock is obtainable at 74, offering 6¾ per cent. on the money at that price. A small amount of Metropolitan-Vickers Electric 4 per cent. mortgage debenture stock can be bought at 74½ ex the interest due this month, the yield being £5 7s. 6d. per cent. The interest service is amply covered, and the stock, although redeemable at any time, cannot be paid off under 110.

La Plata Tramways 5 per cent. debenture stock is 6 points up at 67½; otherwise, this section is disposed to dulness. Brazilian Tractions have fallen back to 56½. London United Tramways debenture at 42½ is 3 down. Calcutta Electric Supply debentures have declined to 104½.

Cromptons did better in the year which the new report covers, the net profit of £20,000 being £18,600 up. The ordinary are not to have a dividend yet: the last paid on these shares was in July, 1922. Shareholders can reasonably hope for something next year. Edmundson's profits show a substantial increase over those of the previous year, and the repetition of 7 per cent. dividend on the ordinary is upon the increased capital of the company.

No recovery has occurred in cable stocks and shares. Western Telegraphs are again lower, at 16; Eastern Extensions at 17¼ are ⅛ easier. Marconis, on their fall, attracted a little buying, and the price rallied to 28s. 9d. Radios are 11⅝ for the common and 10¼ for the preferred. Automatic Telephones reacted to 2 1/16. Chili Telephones are unchanged at 5 7/16. The company's report refers to the offer in Chile of £62,000 of the new capital created last January, but no applications were received. It is rather surprising that the natives of Chile should have failed to take advantage of a new issue of shares that was eagerly taken up in this country. At the Kalgoorlie Electric Power & Lighting meeting last week, the chairman referred to the progress which the company is making, but the price of the 10s. ordinary shares remains at 3s. 6d., while the 6 per cent. income debenture stock is quoted at 50 middle. It is probable that no large amount of either class could be secured in the market at these prices.

British Aluminium have lost 1s. 9d. at 28s. 3d. and Metropolitan-Vickers ordinary shed a florin, going back to 21s. 3d. General Electrics are maintained at 25s., and Johnson & Phillips keep their price at 41s. 3d. India-Rubber shares are scarcely so firm as the nominal quotation of £1 might indicate, there being shares obtainable at about 19s. 6d. The engineering group is quiet: coal mining and railway troubles do not make for public support to this section.

The Shannon Power Scheme.—The Shannon Electricity Bill has now finally passed the Irish Free State Senate, and will receive the Governor-General's assent forthwith. In the closing stage a final protest against the measure was made by Sir John Keane, who argued that the scheme was not economically sound. He was alone in his opposition.

An Electricity Supply (Special Powers) Bill has been introduced in the Free State Parliament to confer special powers for a limited period on certain supply undertakings and owners of generating stations with a view to the more economical supply of electricity pending the availability of electricity supplied by the State under the Shannon scheme.

The Irish Free State Parliamentary Committee on the River Liffey Electricity Bills rejected the East Leinster Syndicate's Bill in favour of the Dublin Electricity Bill promoted by Sir John P. Griffith and others, and the examination of the clauses of the latter Bill will proceed without further questions. The Dublin Corporation's Special Bill was withdrawn, at the request of the Government, after the preamble had been proved.

A Name for 2π-times-the-frequency.—In *Science* of June 5th a letter is published in which Mr. A. T. Jones, of South College, U.S.A., refers to the need for a name for the quantity p which represents 2π times the frequency of a simple harmonic motion, and which appears in the equation $v = V \sin(pt - a)$. Various terms have been suggested by famous physicists, but none of them has been generally adopted. The writer now proposes to call this quantity the "π-frequency." This expression is easily spoken and printed, and suggests a close relationship with frequency.

The International Railway Congress.

A Review of some of the Electrical Features.

(*Continued from page* 11.)

High-speed Electric Locomotives.

The whole of June 26th and the morning of June 29th were occupied by Section II by a discussion of high-speed electric locomotives; two reports were submitted, dealing with the practice and tendencies in America and other countries. Mr. J. T. Wallis (Chief of Motive Power, Pennsylvania Railroad System), reported on American practice, and Mons. M. Weiss (Engineer-in-chief, Swiss Federal Railways and President of Section II) reported upon the practice in other countries. The two reports were analysed in a special report submitted by Mons. Weiss, who put forward the following findings:—

There were relatively few electric high-speed locomotives (running at speeds above 75 km. (46.4 miles) per hour) in service, or at present being constructed; such locomotives ran on, or were intended for, the following railway systems:—

America: Chicago, Milwaukee and St. Paul; New York, New Haven and Hartford; New York Central; Chilean; Paulista; and Pennsylvania Railroads.
Germany: German State Railways.
Austria: Austrian Federal Railways.
England: Metropolitan Railway.
France: French Midi Railway; Paris, Lyons and Mediterranean Railway; and Paris-Orleans Railway (the two last named were in process of electrification).
Italy: Italian State Railways.
Sweden: Swedish State Railways.
Switzerland: Swiss Federal Railways.

Information had only been obtained of high-speed locomotives without carrying axles operating on the Metropolitan Railway, the Paris Orleans, and the New York Central; the two latter administrations had also locomotives with carrying axles and bogies. The transmission of the tractive effort from the motors to the driving wheels was effected by very varying methods—by the direct drive, by connecting-rods, and by driving through gearing and coupling rods. The locomotives with connecting-rod drives had the advantage, possessed also by steam locomotives, of having a higher centre of gravity than the other types of locomotives, which was of importance for securing good running. This arrangement, if well made and well maintained, provided that it was also fitted with spring driving gear, appeared to give good results. The rotating masses on electric locomotives could be accurately balanced, so that there was no production, as in steam locomotives, of additional load due to hammer blow; hence, it was possible to increase the axle load, which, in the case of a locomotive on the Pennsylvania Railroad was 35 tons, and on the Swiss Federal Railways 20 tons.

With the Westinghouse drive (with hollow shafts and driving through springs), spring breakages frequently occurred when the axle load was high, and when concentricity of the driving axle and of the hollow axle could not be accurately maintained in service, a fact that was particularly to be feared on locomotives having more than three driving axles on one frame.

In locomotives with a relatively low centre of gravity, with consequently greater stresses on the superstructure (due to lateral shock), it was advisable to reduce the axle load as much as possible. On locomotives on the Paris Orleans Railway the load was 12.4 tons, and on the New York Central from 15 to 17 tons. In order to obtain good stability in running for high-speed locomotives, a long wheel-base should be provided. The leading wheels with lateral play (radial axle boxes) and leading bogies were generally fitted with restoring gear (springs or inclined surfaces). The restoring force varied greatly from 0 to 14,800 lb., according to the various types of locomotive.

The methods adopted for collecting current were generally of the two following types:—(*a*) Overhead collectors of the pantograph or bow forms, which were in general use on lines using single-phase current, and also often used on d.c. lines. In all cases the collector was raised by compressed air, with the exception of the Midi Railway, on which it was lowered by this means. The contact pressure of the collectors on the wire varied from 22 to 33 lb. for d.c. and from 6.6 to 11 lb. for alternating and three-phase current. (*b*) Collector shoes, only used on d.c. lines.

The main switch was either constructed with a magnetic blow-out, with or without high-speed break (the latter method was coming more and more into use) for d.c., or with a multiple-break oil-break for a.c. The main switch was controlled differently on different administrations, either by hand, by compressed air, or electro-pneumatic, electro-magnetic, or electric control. The control gear appeared to be settling down into the two following main forms:—(*a*) For d.c. and to some extent for single-phase current, a controller with contactors; (*b*) for a.c., either controllers with contactors, or in the form of cylindrical contacts or appliances consisting of contacts arranged near together with special contacts for breaking the spark. It would appear that the electro-pneumatic control was in most general use up to the present.

The transformers required on single-phase locomotives, and to some extent also on three-phase locomotives, were of the oil-immersed, or air-cooled types; it might be said that the oil-immersed type appeared to be more favoured than the other. The cooling of the transformer was generally effected by means of fans.

The external form and dimensions of traction motors varied with each type of locomotive; between the lowest-powered locomotives (of from 185 to 275 h.p.), of the Metropolitan Railway and the Midi Railway, and the highest powers (3,000 h.p.) of the German State Railways, all intermediate powers might be found. The mean value was from 550 to 600 h.p. The cooling of the motors was, with few exceptions, effected by special fans. Where d.c. was used, insulation generally presented some difficulty; with a.c., on the other hand, the weak point was the commutator; experience showed, however, that the cost of maintenance under some conditions could be considerably reduced, and the mileage run after turning up until this was again required might be high (94,000 miles on the Swedish State Railways).

The auxiliary electrical equipment of the locomotives did not vary appreciably for different types of locomotive. The question of train heating had not yet been definitely settled, but it appeared likely to be generally effected, in Europe at any rate, by means of resistances on the trains.

Direct comparison of the power of these locomotives was rather difficult, owing to the fact that at present there were no existing international standards that defined the maximum permissible heating of the motors and the methods by which the tests should be carried out.

It was pointed out by Mr. Weiss that present experience was not sufficient to enable them to judge which types of locomotive were best suited to through-train service. Further experience was necessary before it would be possible to make certain which type, using a particular type of current, and under actual conditions of working, would be the most suitable for this purpose. In particular, it would only be after further experience that they would be able to ascertain which method of driving was best suited to these locomotives—through connecting rods and coupling rods, or the direct drive.

Mr. WALLIS, in his analysis of American practice, said that there was a tendency towards greater application of the principles followed in steam locomotive design, and towards greater co-operation between electrical and mechanical engineers, a very hopeful indication.

Discussion.

Mr. BACHELLERY (of the Midi Railway, France) referred to the working on that railway of electric locomotives of the two-truck type with ordinary tram-geared motors. They behaved quite well on the track at a speed of 55 miles an hour, which they normally attained. There had been a little trouble with the collector brushes, which had had to be modified. With regard to the mechanical side, he said that, in order to attain high speeds, it was necessary to couple the trucks together as tightly as possible. He had found it necessary to supplement the drawbars between the trucks with lateral buffers, which did not allow lateral movement, and that gave good results.

Mr. LEBOUCHER (Midi Railway) said he had had considerable trouble with brushes, owing to inertia effect, but by dividing the brushes, and thereby reducing the inertia, the locomotives could be run at speeds of 100 kilometres (about 62 miles) an hour without flashing or other difficulties.

Mons. G. BIANCHI (Italian State Railways) said that in Italy they used double-bogie locomotives with a spherical coupling, and had no difficulty with them when running up to 110 km. (70 miles) per hour. He considered that the difficulties with brushes were due to high-voltage, and that possibly the higher "tension" in France as compared with Italy would lead to more trouble in the former country. In reply to a question, Mons. Bianchi said that the motor was spring-borne on the locomotive he had referred to.

Mr. WEISS, discussing connections between bogies, said that on the Swiss railways they had suffered from excessive tire wear on express passenger engines. This led to the introduction of a special coupling, by means of which the leading bogie guided the trailing bogie and prevented the leading wheel of the trailing bogie pressing too heavily on the rail. By this means tire wear had been reduced.

Mr. BIANCHI said that in Italy they had 535 electric locomotives with the rigid rod drive, and there were no means of adjusting the centres of the rods. The maximum play allowed was 0.2 mm.

Mr. WALLIS said that in the United States it was the general feeling that all engines should have springs between the rods and motor shafts. Some locomotives were running without them, and there was a tendency to do away with them in the lower-speed locomotives. Most people who were

considering high-speed locomotives in America, however, wanted to use springs to take care of the shaft between the motor and the rods. There was very little difficulty with regard to the maintenance of the rods of high-speed locomotives so far. There were about 33 rod-driven locomotives on the Pennsylvania railroad with no spring arrangement, but there was a slip arrangement by which the crank slipped on the motor shaft, and pressure was exerted on a disk that was supposed to take care of the inertia of the motor, but experience showed that it was very rarely necessary for this arrangement to come into action.

Mr. WEISS, dealing with gearing and lubrication, said that on the Swiss railways different types of gear were used, none of which had given any difficulty, although it was rather early yet to make any definite statement. It was essential that the gears should be very carefully made. Oil was used entirely for lubrication and, although there had been trouble at first through leakage of oil through the boxes, that had been overcome.

Mr. BACHELLERY discussed some of the peculiarities of the gears used on the Midi Railway. There had been a lot of trouble with a gear which was fixed on the axle, because the axle was liable to break between the gear and the wheel. To do away with that difficulty a new type of gear was designed, with simply a gear rim fixed to part of the wheel centre, so that the effort was transmitted, not to the axle, but to the wheel itself. Very good results had been obtained with that. Moreover, on the locomotives developing high tractive effort there was generally a double gear, one at each end of the axle, so that the effort was perfectly balanced. Grease only was used for lubrication; that gave very good results, and the gears wore very well.

Mr. WALLIS said that on the latest locomotives on the Pennsylvania railroad that method of attaching the gear to the shaft had been utilised. The bearing was on the hub of the wheel, and the shaft went through that, so that in America they accepted the same practice as had been described by Mons. Bachellery with regard to the connection of the gear on heavy locomotives.

Mr. LEBOUCHER said that on the Midi Railway they used a pump for the continuous lubrication of high-speed locomotives with vertical motors, and transmission of the power by right-angled pinions. The result had been satisfactory.

Mr. WALLIS referred to a locomotive used in America of which all the bearings in the motor assembly were oiled by means of a circulating pump. The gears were lubricated with grease. The circulating pump was mounted on the shaft of the gear.

The question then arose as to the use of directing axles on electric locomotives, and the weight on axles.

Mr. BIANCHI said that the Italian railways had locomotives with a speed up to 100 kilometres (62 miles) per hour, with no directing axle at all.

Mr. BACHELLERY said that on the Midi Railway there was no difference in axle weight as between steam and electric locomotives, and it was considered that, for a particular axle weight, the electric locomotive was safer than the steam locomotive, because with the former there was no alternating effort on the track. Thus, in electric locomotives they had a weight up to 18 tons for the driving axle, and on the two-truck electric locomotive, which attained a speed of 55 miles per hour, there was an 18-ton axle without any directing truck. For locomotives attaining a speed of 65 miles per hour, it was considered advisable to use directing trucks.

Mr. H. PARODI (Paris-Orleans Railway) raised the question of the disposition of axles as between electric and steam locomotives, pointing out that a steam locomotive was usually turned round at the end of its journey and, therefore, always pulled in one direction, but that an electric locomotive was not usually reversed, and it was necessary, therefore, to design it so that it would pull at high speed in both directions.

Mr. WALLIS said that on the Pennsylvania railroad an electric locomotive had been built having a single truck at each end. When tested and compared with a steam locomotive, there was no difference between the two from the point of view of pressure on the track. The two ends of the electric locomotive were alike, except that the truck at one end was connected to one pair of drivers, and that at the other end to three pairs of drivers.

Mr. BACHELLERY said that the high-speed electric locomotives of the Midi Railway, attaining a speed of 130 kilometres (80 miles) per hour, had a symmetrical disposition of axles, and had not given any trouble from the point of view of stability on the road. He was glad to hear Mr. Wallis say that the same conclusion had been reached on the Pennsylvania railroad, because about 20 years ago they had concluded that the symmetrical arrangement was a source of trouble at high speed.

Mr. WALLIS said that the original conclusion was based on an improper arrangement of the springs, and that, had the springs been modified, the subsequent conclusion would have been reached in the first place.

Mr. BIANCHI, comparing steam and electric locomotives from the point of view of mileage covered without repair, said that in Italy electric locomotives had covered a mileage of 75,000, as against about half that amount by steam locomotives. The mileage of the electric locomotives had since been reduced, for service reasons.

Mr. PARODI considered that the mileage of electric locomotives was about twice that of steam, under the same operating conditions.

Mr. WEISS said that the difference between the two in Switzerland was not so great. His figures were 50,000 miles for steam, and 60,000 for electric engines.

Mr. LACOIN (Paris-Orleans Railway) pointed out the difference between the distances run in Switzerland and Italy, and said that this question was one which had to be considered, not only from the electrical and mechanical points of view, but also in relation to service and the general organisation of trains.

Sir HENRY FOWLER (L.M. & S. Railway) said that the figures given by Mr. Bianchi were low as compared with the English standard, and needed to be multiplied by three or four.

Mr. WALLIS said that the first three electric locomotives built by the Pennsylvania railroad, in 1910, compared favourably, from the point of view of repairs, with steam locomotives. There was regular repair of the running gear, boxes, wheels, tires, &c., in both types. The electrical repairs amounted to practically nothing, and, since 1910, only in the case of four or five of the electric locomotives had re-winding been necessary. He had not the exact figures of mileage, but it was at least 100,000 miles between repairs of wheels and tires; between repairs of motors it was much greater.

The next question discussed was whether it had been found that the presence of the oil necessary for the circuit breakers used with alternating current or with the transformers gave rise to any danger in working.

Mr. BIANCHI said that in Italy they had had experience of interruptors working in oil, but they had given trouble owing to the breaking of the containers. This only applied to locomotives working on the industrial frequency.

Mr. F. STEINER (Swiss Federal Railways) said that undoubtedly there was danger if oil were used in transformers, both as regarded explosion and fire. The danger could be reduced by paying particular attention to weak points of construction of the apparatus. The remedy was also to be looked for in the direction of the use of air insulation rather than the use of oil.

Mr. WALLIS did not think the subject was nearer settlement in America than in Switzerland. They had not enough engines running to produce sufficient experience to enable a final design to be arrived at. Nobody had objected so far to the oil transformer.

On the question of what type of remote control had given the best results, Mr. BIANCHI said that in Italy electro-pneumatic control had given the best results.

Mr. WALLIS said that both electric and electro-pneumatic control were used in America, and he believed experience there was the same as in Italy.

Mr. LEBOUCHER said that on the Midi Railway cam control had been adopted. It appeared attractive at first sight, but had certain disadvantages, particularly when it was desired to cut off the current, the principal trouble being with the pneumatic blowers, which were of different patterns. In the end they were obliged to cut the current off by the main switch, which caused a rise in voltage on the locomotive and an unfortunate effect on the line. Consequently they were adopting electro-pneumatic control for the latest machines.

Mr. PARODI said that the Paris-Orleans Railway made tests 20 years ago with the purely electric and electro-pneumatic systems, and had chosen the latter.

(To be concluded.)

The 27th Anti-Aircraft Battalion, R.E., T.A.—All suitable candidates for enlistment in the 27th Anti-aircraft Battalion R.E. (London Electrical Engineers), of the Territorial Army, are cordially invited to call at the battalion headquarters, 46, Regency Street, to receive any information desired concerning the unit's activities. This unit was founded originally by the late Dr. John Hopkinson in 1898, and served during the South African War, and it still carries on the old traditions of good work and fellowship. Technical knowledge is not an essential qualification for recruits, and any who show keenness and intelligence will be welcomed and helped to become efficient members of this progressive and well equipped force. The primary rôle of this unit lies in the defence of London against enemy aircraft, and it has an up-to-date plant, including searchlights, stationary 40-h.p. generating sets, lorries, sound locators, and all the minor accessories. The terms of enlistment are, initially, four years' service, with an optional minimum of one year, and the age limits are 17 to 50. Each member is required to attend 40 drills of one hour each, a one-day's musketry course and a summer camp of 15 days, usually at a seaside place, during the first year; and 20 drills, and the other obligations of the first year, during the subsequent years. The camp pay for N.C.O.'s and men ranges from 2s. 9d. to 14s. 0d. per day, according to qualifications and rank; and everything is found, uniform, kit and equipment being provided. Marriage allowance is paid to married men over 26 years of age. The training is of a most interesting character and affords the opportunity to learn the groundwork at least of certain branches of electrical and mechanical engineering. Displays, such as those at tattoos, and the Royal Tournament at Olympia, which are frequently operated by the unit, add to the interest of the duties. A billiard table, canteen and miniature rifle range are among the provisions made at the headquarters for the social entertainment of members.

The Incorporated Municipal Electrical Association.

Annual Convention at Brighton.

(*Continued from page* 34.)

ıre Supply Authorities doing their utmost to develop the Demand for Electricity?

By W. H. THICKETT (Chairman, Grimsby Corporation Electricity Committee). (*Abstract.*)

The annual output of electricity by statutory undertakings as increased during the last 20 years from about 500 million Wh to some 5,000 million kWh. In 1918 the municipal out-ut was 2,367 million and in 1924 3,821 million. This output, may point out, is nearly double the corresponding output by ompanies. Yet in spite of this progress the output of elec-ricity per head of the population in Great Britain remains ar below that of many other countries.

The number of "authorised undertakings" in Great Britain n March 31st, 1924, amounted to no fewer than 560. An nalysis of the total number of generating stations shows that, f 541 stations submitting returns 224, or 41 per cent., gene-ated less than one million units each, while 398, or 73 per cent. f the stations, generated less than ten million units each. It s apparent that there is great scope for re-organisation on lines vhich will lead to the more economical production of elec-ricity, by concentrating the generation in fewer well-placed nter-connected stations and thus leading to the supersession f many of the small and uneconomical stations, both public nd private, as cheaper and reliable supplies become available rom such centralised systems. Since the establishment of the ommissioners, local generation at 37 small stations has been ntirely superseded by bulk supplies, and in upwards of ten urther cases similar stations have been relegated to the posi-ion of stand-by sources of supply only. This desirable pro-ess needs to be accelerated.

The present consumption of electricity in Great Britain is bout 130 units a year per head of the population. Yet the verage consumer in the best organised, lowest priced dis-ricts, has been proved capable of using some 2,000 to 3,000 nits a year instead of the 200 to 300 required for lighting lone. Recent experience in those districts has shown that the verage consumption throughout the country might easily be rought up from 130 units per head to somewhere between 00 and 750 units.

How are we to effect this? We must first realise the ob-tacles; these—excluding, of course, obstacles at present in-erent in the national organisation of the industry—may per-aps be classed in the following order:—Cost of appliances, nstallation, &c.; lack of knowledge by the people; and cost of lectricity in certain districts.

It is a well-known fact that a large number of the most ractically useful and far-reaching scientific discoveries have een made by men whose aim was simply the discovery of ruth. This always must be the governing aim of the true earchers after knowledge, and I will suggest to you very trongly that research can only be conducted and encouraged n these broad lines. We must do all we can, working both hrough such an organised body as the British Electrical and llied Industries Research Association, and through every pri-ate channel we can devise, to see that a constant all-round ffort of research into every kind of electrical problem is kept p and generously provided for. If we do this, we shall not ind the practical and profitable results wanting; but if we efuse to take this broad view, and refuse to encourage any esearch of which we cannot at once foresee the practical and rofitable issue, we shall be wasting the money that we do pend.

Closely related to research, and of extreme importance in lealing with the problem of domestic supply, is the question f standardisation. The term "Standardisation," is no doubt nappropriate. It seems at once to convey the idea of crystal-isation and the setting up of an unalterable standard. Too nuch stress cannot be laid on the fact that industrial stan-lardisation need involve no such dangers. Specifications pre-ared by the B.E.S.A. are rather in the nature of handy tools o be used in contracts for the purchase of materials and ap-aratus on the most economical lines.

The British Standard Specifications are arrived at by unify-ng the needs of industry and recommending what is best n present practice and what can be adopted by industry with he least possible disturbance. In its broadest sense this olicy means national simplification, the reduction of the num-er of types and patterns used for one and the same article. Proper safeguards are needed, of course, principally a thorough eriodical review and revision of the specifications.

I suggested to you that the first obstacle to the growth of he electric home might be regarded as the cost of the appli-nces and installation; and it is to research and standardisation hat we must look to remove this basic disadvantage. One ears eminent and able men in charge both of municipal and f company undertakings who say that the great domestic levelopment must pay its way from the first, and can only e carried out where there are profits to be obtained from such speculative enterprise, and so on. Why? These same men n the past progressed by steady steps, with courage rather han with caution, and the reward and stability of the domestic business is apparently likely to be higher than anything we have enjoyed in the past.

We have in this country been making electric cookers which would cook, for possibly 30 years. During the past ten a really practical appliance has begun to emerge, and in the last four or five years we have had put at our disposal some very sound stuff, any minor defects in which are disappearing rapidly. Yet the full electric cooking range for domestic use is apparently now being turned out by no more than a bare dozen manufacturers. They are producing something like 15,000 or 20,000 ranges a year, and the curve of output is rising rapidly. There are probably not less than 50 undertakings offering electricity at rates which make it easily competitive with gas and coal for cooking. If we assume, on a normal basis of calculation, that such areas include a quarter of a million houses, or about one-fifth of the total number of houses connected with electricity supply, to provide those people with cookery appliances on our present production basis looks like a ten-year job. These facts suggest a further question. How far can we expect at present to compete with coal and gas purely in the matter of price, and how far should pure consideration of price affect our attitude towards efforts at domestic development?

Equally essential, I believe, is uniformity of price. Not only do the present wide discrepancies between different areas render impossible any uniform national policy of publicity and development, but they undoubtedly convey to the consumer an impression of uncertainty and unstability which disinclines him to "go all out" on electricity even if he lives in one of the best and cheapest areas. He feels that he may, if he moves, find himself in an area where he will not be able to afford to use electricity for any but a few purposes. Hence he hesitates to equip his house with a full range of electrical devices, and accustom his family to use them. He is inevitably led to look on electricity rather as an occasional luxury than as a universal necessity.

There is ample scope for greater foresight and enterprise in paving the way for domestic electrification by the extension of wiring facilities rather in anticipation of, than in response to, specific demands. The extension of mains and cable networks is a perfectly sound investment which should be carried out progressively on generous, far-seeing lines. Ample cable work is relatively much cheaper than restricted cable work. Some undertakings are already laying down from 100 to 400 miles of cable a year.

There are at least 100,000 houses in Glasgow suitable for electrification. Most of these are occupied by tenants on a yearly rental basis. Hence the difficulties of arranging for electrification must obviously be greater than if the houses were occupied by their owners, who would stand to gain directly through the increased value of their properties once electricity had been introduced. After various ineffectual efforts to deal with the problem Mr. R. B. Mitchell, engineer and manager of the electricity department, devised a plan for wiring houses on the easy payment system, with a view to making a studied inroad on the large number of unwired houses in the Glasgow area. In September, 1924, the Glasgow Corporation approved the scheme and it was put into operation. The cost worked out at £4 10s. for a five-roomed house, to include eight lighting points and three plugs, and in spite of various obstacles 640 houses were wired in the first six months and no bad debts were incurred.

In one of the residential districts of Brighton Mr. Charles Blaker and his architect, Mr. E. Weir, have been building labour-saving houses comprising two floors, four bedrooms, two reception rooms, with bathroom and usual offices, which they are able to offer to the public at a price of £1,000 or a little over. Each house has one coal fireplace in the dining room and one central water-heating stove of the "Glow-worm" type in the kitchen. Only two flues are necessary, but in construction a six-flue chimney has been employed, the spare ducts being used to ventilate the rooms, which they do very effectively. Other artificial heating for the different rooms including the dining room in all but the coldest weather, is provided by electric fires. The omission of the usual complement of fireplaces, chimney breasts and flues is of great importance. The saving effected by this radical change in design is far more than sufficient to cover the whole cost of a full range of electrical equipment.

It is impossible to speak of the problem without a word on tariffs, but I do not wish to enter into the technical details of the various possible tariff systems. My own views are in agreement with those expressed at the Institution meeting by my friend and colleague, Lieut.-Col. W. A. Vignoles, D.S.O. I take this summary of part of his remarks from the ELECTRICAL REVIEW:—

"They must have a one-meter tariff. The only practical tariff was the plain two-part one, with a fixed charge per year, plus 1d. per kWh. That had proved to be successful, and he was certain that they would all adopt it sooner or later. It was difficult for a Government department to make anything compulsory, but the Commissioners' Committee which proposed to fix the first charge would, if it tackled the matter

properly, solve their difficulty. He maintained that the tariff problem was settled, and that now they must get down to the business of selling electricity by the same means as were used for selling other commodities."

To selling electricity—yes, that is our business too often neglected in the past. But I should like to emphasise to you that it is useless to sell electricity by itself as an impersonal commodity. Every sale of electricity must be accompanied by a generous giving of service. Our aim must be to sell to the consumer not lamps, stoves, and motors, but light, heat and help.

Let me draw your attention to one field in which Great Britain is at present most certainly not "making the most of electricity." I refer to agriculture. In this connection I would commend to your notice the pamphlet entitled "Electricity on the Farm," written by Mr. R. Borlase Matthews. There is plenty of work for electricity on the farm, and the need for it there should, I suggest, be earnestly and increasingly considered by all undertakings whose power lines are within convenient reach of agricultural areas.

Electricity and publicity—our business as electrical suppliers requires the closest, the most constant union between the two. I think it may safely be said that in the past our publicity work has been far and away the weakest point in the whole organisation of the electrical industry, and that this weakness has been more fully responsible than any other single cause for the inadequate use made of electricity throughout the country. We must realise that the electrical industry, on account of its high overhead charges, is very particularly dependent on a larger and constantly increasing demand for its product. The only way of creating this demand is through educational publicity. There are two broad kinds of publicity—the one personal and local, the other co-operative and national.

The E.D.A. is just now asking for modestly adequate funds to continue the work which it has been doing for the past five years. Its present demand is for really less than sixpence per year per consumer, and the contributions from each undertaking are very small indeed compared with the total volume of its business and its expenses. When this small contribution is sent forward into the central exchange, the whole value of the work which it makes possible comes back to the contributor. The E.D.A. classes its publicity work under three broad heads :—

Educating the consumer in the various uses and applications of electricity supply.

Assisting him to obtain appliances and material.

Securing the sympathetic interest of all in the electrical industry, and enthusiasm for the electric method in home, business and industrial life.

Just as publicity must be of two kinds, national and local, so its appeal must, broadly speaking, be of two corresponding kinds—general and personal. We have first to create a general atmosphere favourable to electrical development. We need for this a wide diffusion of knowledge as to the advantages and capabilities of electricity. We must see that every man and woman in the country, whether a user of electricity or not, has a firmly impressed notion of what electricity can do for social progress and domestic efficiency. We must cultivate the idea of an "Electrical Age" as, from the point of view of social organisation, a golden age, a noiseless soot-less age, swift and clean, ever-ready and trouble-free. We can do this both by making clear what electricity has already achieved in those countries and districts where it is most used, and by explaining in detail what more it might do if the public would only give free scope to its services by asking for them. A general broadcasting of electrical propaganda is necessary and valuable, but it is not enough. From the central power house of our publicity we must carry our lines of propaganda into every individual household and there light the lamps of electrical knowledge.

Discussion.

The PRESIDENT said that although the paper was addressed principally to Committee members, it also provided a stimulus for engineers and managers to impress upon their Committees and Councils the importance of supporting the three Associations relating to research, standardisation and publicity referred to in the paper.

Mr. LL. B. ATKINSON said that his main object was to bring the importance of research and the need for supporting it financially, to the notice of members of Electricity Committees. The whole electrical industry was founded upon research, and its continued prosperity depended upon research being continued on a very large scale. There were two classes of research; *viz.*, that carried out by individual firms for their own special benefit—a very legitimate class of research—and that carried out for no one's special benefit, dealing with the fundamentals of the industry and therefore only to be carried out effectively co-operatively. As far as the first type of research was concerned, it was estimated that a sum of £250,000 per annum was being spent in that manner. As to co-operative research, with which he was more particularly concerned and which dealt with materials and substances and methods, and promised no particular benefit to anyone and yet was of primary importance to the proper development of the industry as a whole, the sum of only £20,000 a year was being spent on this, partly provided by the State and partly by a group of manufacturers, and this in an industry which must be reckoned not in thousands but in millions of pounds sterling. Dealing specifically with the electricity supply industry, he said that the placing of this largely in the hands of municipalities was a great social experiment. Public control of great industries involved very considerable responsibilities and, so far as research was concerned, he could not but say that they had failed lamentably in taking their share of those responsibilities. That was due to the fact that they had not understood what research could do. The engineers had understood it, but the Committees and Councils had not, and therefore he wished this paper to be a starting point for Chairmen and members of Committees. He believed that when they fully understood the importance of the point he was stressing they would come forward and assist in the work of the Electrical Research Association to a much greater extent than in the past.

The HON. SECRETARY then read a letter from the Electricity Commissioners in which attention was called to the position of the Electrical Research Association. It was pointed out that at present the Association was mainly financed by the B.E.A.M.A., and an equal contribution from the Department of Scientific and Industrial Research. The Commissioners had been informed that there was a possibility that the financial grant from the Department might cease after this year or might be given on a descending scale for a limited period. In these circumstances it was evident that unless some additional source of revenue could be secured, the work of the Association, which had already proved of considerable value to the electricity supply industry might have to be curtailed or discontinued altogether, and the Commissioners were confident that on the position being made known, the necessary support for the continuance of the work would be forthcoming from authorised undertakers and others directly and indirectly concerned in the activities of the Association. The Commissioners expressed their sympathy with the endeavour of the I.M.E.A. to secure support from its members, and stated that they were prepared to sanction the payment of reasonable subscriptions in this connection under Section 30 of the Act of 1919.

Mr. C. LE MAISTRE (Secretary of the British Engineering Standards Association), in asking for additional support for that body, spoke of the manner in which the work was restricted through lack of funds. At present something like 300 standard specifications were in hand, but it had been possible to issue only 45 of them for this reason, and the work of the Association was being starved through inadequacy of office accommodation and staff. The endeavour was being made to secure that its work should be effective throughout the world, and he impressed upon the meeting the great saving and convenience which would result all round if British standard specifications, with the imprimatur of a body like the B.E.S.A., were generally adopted and were translated into foreign languages. The general aims of the Association were being copied by the Americans, who had put a large scheme in hand in an endeavour to secure as much as possible of the trade in South America, and they were spending money very freely on standardisation in America. Last year the subscriptions to the B.E.S.A. from private sources amounted to £12,000 and the sum received from the Government was only 10 guineas. He hoped that that would be remedied and in order to increase the private subscriptions, a scheme had been put into operation whereby professional business and other men connected with the industry, including firms and municipalities, could become members on a two-guinea subscription which would carry with it certain privileges. He expressed the hope that municipal electricity supply authorities would support this work both in the interests of the development of the industry here and also in assisting us more effectively to meet foreign competition.

Mr. J. W. BEAUCHAMP (Director of the Electrical Development Association) spoke of the work of that body and the new scheme of subscriptions sanctioned at the annual meeting a short time ago on the basis of the payment of a subscription amounting to one-tenth of one per cent. of the revenue of supply undertakings, the manufacturers having promised to contribute to an increased extent. The details of that, he said, and arguments in favour of the scheme, had been set out in a booklet which was being distributed to all municipal and other supply authorities. Hitherto the Association had been working on a subscription of about £5,000 a year, but the amount of money required to carry out a more intensive propaganda was four times that amount. Since the booklet to which he had referred had been distributed three weeks ago he thought he could see half the extra sum in sight and his visit to the Convention had been extraordinarily successful in obtaining promises of support. He concluded by saying that he had got to have this money and that whatever might be the result of the appeals on behalf of research and standardisation, he knew the industry would provide him with what he wanted.

Ald. JAMIESON (Glasgow) said he would recommend his Council to support the Associations mentioned in the paper. The Belfast Gas Department contributed £900 a year to the various Associations.

Councillor W. HAMMER (Hackney) said that what was wanted was to take every possible step to secure full wiring powers for the municipal electric supply authorities, because 90 per cent. of the people of this country lived in small houses and had very small incomes, so that unless some system could be adopted for wiring these places through municipalities, these people would never get the advantages of electricity.

Councillor HIGGINS (Glasgow) said that the average man or woman did not need to be convinced of the benefits and advantages of electricity supply; what they wanted was to be able to secure it at a price within their means, and he wondered how

many municipal electric supply authorities were endeavouring to find a solution of that problem. In Glasgow an endeavour was being made to deal with it by means of an assisted wiring scheme, and further efforts in that direction were necessary.

Councillor CONOLLY (Salford) alleged that councillors and would-be councillors had more to do with retarding the growth of electricity than anybody else. There was no doubt that more research work was necessary if electricity was to be developed on the right lines and yet as soon as funds for this purpose were suggested, there was opposition in councils and committees. The development in Salford had been very much held back because of this class of opposition.

Councillor TUMMON (Sheffield) said that although many interesting things had been said with regard to the importance of research, standardisation and publicity, he would like to get down to something of practical interest at the moment, viz., what was actually being done to bring electricity within the reach of the people. The Sheffield Electricity Committee had supported the E.D.A. to the tune of £500 to start with, and he would have great pleasure in bringing the appeals that had been made to the notice of his Committee.

Alderman SENNINGTON (Bristol) said that the important thing to concentrate upon was the cheapness of electricity supply, because there had been cases in Bristol where people had gone back to gas on this account. In looking at figures of cost throughout the country, it was impossible not to be struck by the extraordinary variation both of costs and charges, and attention should be given to this.

Alderman (Mrs.) HAMMER (Hackney) asked the members to give all the support they could to the newly-formed Women's Electrical Association, because it was only by educating the women that the greatest development in the use of electricity could be looked for in the home. What was required was a central place where women could go for information and the Women's Electrical Association hoped to provide these facilities with the support of the industry.

Councillor THICKETT, in the course of a short reply, said he had not written the paper from any pessimistic point of view. The question was whether they had done all that could be done. Nobody could be satisfied with the position of the supply industry as it was to-day, because things could be very much better than they were, and the object of the paper was to stir up interest from that point of view.

(To be continued.)

Finnish Trade and Conditions.

The Development of Natural Resources.

ALTHOUGH Finland, on account of its small population, cannot be looked upon as a potential large consumer of British electrical goods, it possesses a certain significance from its proximity to Russia. It is probably in the light of this that a recent report by Mr. C. H. Mackie, the British Consul at Helsingfors,* should be read. This report reviews the economic, financial and industrial conditions of Finland. In some prefatory notes the population of the country is given as 3,400,000, of which 65 per cent. is engaged in agriculture, and only 15 per cent. in industry and manual labour.

Foreign Trade.

Great Britain is by far Finland's most important customer having taken 40.3 per cent. of her exports in 1924, Germany being second with 9.1 per cent. The positions are reversed in the case of imports; in 1924 Germany supplied 29.9 per cent., and Great Britain 18.8 per cent. The imports and exports for 1924 are fully analysed in an appendix to the report, and it is seen that electrical machinery weighing 1,141,936 kg. was imported during the year, the value being given as 21,729,650 Finnish marks (about £114,370). Insulated wires and cables are shown at 972 987 kg., valued at M 11,074,881 (£58,300); incandescent lamps at 82,455 kg., valued at M 13,583,442 (£71,500); steam machinery and turbines at 98,848 kg., valued at M 2,473,281 (£13,000); and water turbines at 364 kg., valued at M 6,800 (£36).

Copper Production.

A number of the older copper deposits in Finland are said to be extinct, but in 1909 a new important deposit of ore was discovered at Outokumpu, in East Finland, within easy reach of the sea. This deposit has a width of from 7 to 28 ft., and a length of about a mile, and it has been penetrated to a depth of 600 ft. It is estimated that about eight millions tons of ore (containing from 4 to 5 per cent. copper and 1.5 per cent. zinc) is available, but there is reason to believe that the deposit extends much deeper in which case the quantity may be much greater. The actual production of copper is at present estimated at 300,000 tons, worth about £20 millions at present prices, but double or treble that quantity may possibly be obtained. The State has acquired the Outokumpu Copper Works and provided working capital of M 3,458,000 for 1925. In the appendix referred to above, the exports of "Copper, unworked and scrap," are given as 195,611 kg., valued at M 1,637,985 (£8,620).

* Stationery Office. 2s. net.

Lead and zinc ores exist along the coast of the Arctic Ocean and in the southern part of Finland, but their economic value appears at present to be uncertain.

Hydro-Electric Development.

A scheme of reclamation of flooded land involving the regulation of the Vuoksi River, has been put in hand, and in this connection an important hydro-electric scheme is being carried out. This is the Imatra Rapids scheme, to which we have made reference from time to time. This scheme comprises a water area of about 60,500 sq. km., and embraces the large number of rivers and lakes that, pouring their waters into the great Saima Lake, issue forth as the Vuoksi River. The rapids on the first 27 km. of its course have a total fall of 64.24 metres, making the river very suitable for hydro-electric power production. A dam is in course of construction above the rapids in order to raise the water level there and attain a net head of 23 metres in the power plant, ultimately to be raised to 24 metres. The work of excavating the canal 500 metres long which will lead the water from above the dam to the power house, and the tail race of similar length linking up with the lower river is nearing completion. The site for the power house has been cleared and the building is in course of erection. It will accommodate three turbo-generators with an aggregate capacity of 80,000 h.p. A Swedish firm has secured the contract for the generators, while the turbines will be installed by a Finnish company. Tenders have been invited for sluice machinery and sub-station equipment. It is hoped to complete the first stage of the scheme by 1928.

General.

Finnish industry, in common with that of most other European countries, met many difficulties during 1924, the chief being stringent credit conditions and money shortage. The metallurgical industry appears to have suffered from the depressed state of the market, and electrical engineering works complained of keen foreign competition which compelled them to confine their attentions to the smaller classes of goods.

Mr. Mackie says that a ready sale can generally be found for all classes of British goods provided their prices are on a level with those of other countries' products. The British manufacturer is now more or less inclined to give as favourable payment terms as his competitors, but there is a general complaint that his prices are too high. The quality of British goods is never disputed, but their cost often appears to be beyond the means of the Finnish buyer. It is also stated that foreign suppliers have much better representation in the market than the British manufacturer.

Electrical Trade in Brazil.

The Scope for Domestic Appliances.

MR. P. W. COOK, Trade Commissioner of the Canadian Government at Rio de Janeiro, has recently reported on the Brazilian market for domestic electrical appliances. He considers that the country's position with regard to actual and potential hydro-electric development is most satisfactory, the comparatively small seasonal climatic change being favourable to steady output. Mr. Cook apparently regards the recent difficulties due to water shortage in Sao Paulo as exceptional and unlikely to recur.

There is no doubt that hydro-electric development has been undertaken on a large scale and at a cost comparing favourably with all other South American countries. Yet owing to lack of social development the use of electrical domestic appliances is comparatively small at present. At the same time the national manufacture of electrical appliances has not as yet progressed far and consequently the market remains largely supplied by importation which in Mr. Cook's opinion, represents but a fraction of the potential market.

For the guidance of exporters the Trade Commissioner gives the voltages, &c., in the various cities. In Rio de Janeiro, Pernambuco, and Sao Paulo, a.c. at 50, 50, and 60 cycles respectively, at voltages of 120 and 220, is employed. Porto Alegre and Ceará have a 220/230 V, d.c. supply; while at Bello Horizonte and Juiz de Fora, 60-cycle a.c. at 220 V is in use.

The Trade Commissioner proceeds to describe the selling possibilities of a variety of electrical appliances. He says that electric irons have a steady market in all the larger cities. A 3-lb. iron sold c.i.f. at 8s. or 9s. would stand a fair chance. Toasters are used to an increasing extent, not only for domestic purposes but also by a number of the more important hotels.

There is a fairly good demand for grills, and it is apparently increasing. The price to the trade of a grill weighing 3 lb. is about 8s. or 9s. There is practically no market for electric stoves, nor are cooking ranges used to any appreciable extent.

For curling tongs there is a fairly steady demand, undoubtedly growing from year to year. The prospects for washing machines are poor, but cheap and efficient electric refrigerators would sell well.

As regards electric lighting sets, there is some demand in South and Central Brazil, *i.e.*, the States of Rio Grande do Sul, Santa Catharina, Parana, and in the interior of Sao Paulo and Minas Geraes.

The Electrical Imports of Australia.

(Britain's Preponderating Share).

THE following figures showing the values of the imports of electrical goods into Australia in the fiscal year 1923-24 have been taken from the recently-issued official trade returns. The corresponding figures for the previous twelve months have been added for purposes of comparison and notes of increases or decreases given. We refer briefly to the electrical exports at the end of this article.

	1922-23. £	1923-24. £	Inc. or dec. £

New Electrical Devices, Fittings, and Plant.

(Readers are invited to submit particulars of new or improved devices and apparatus.)

Extra-High-Pressure Potential Transformer.

In the accompanying illustration, fig. 1, is seen an e.h.p. potential transformer on test recently at the Rugby works of the BRITISH THOMSON-HOUSTON CO., LTD. It is designed for use on a 110,000-volt circuit, and occupies a floor area of 5 ft. 6 in. by 4 ft. 3 in. It measures 7 ft. 2 in. from the floor to the top of the tank, the overall height to the top of

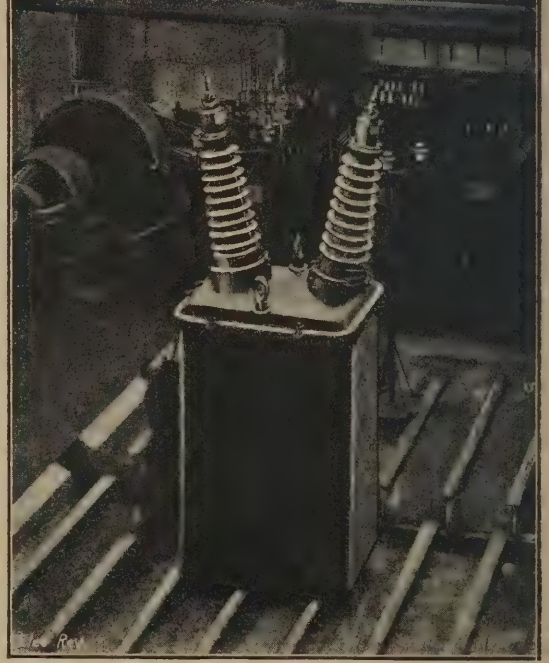

Fig. 1.—A 110,000-V Potential Transformer.

the bushings being 11 ft. 8 in. The transformer holds 600 gallons of oil, and when empty weighs 4,200 lb. It is interesting to note that four transformers, similar in design but for use on a 25-cycle, 74,000-volt circuit, are now in course of manufacture at the Rugby works, and will shortly be put on test. These transformers, as well as the 110,000-V unit illustrated, it is claimed, meet the requirements of B.S.S.81.

A Quick-acting Circuit Breaker.

According to *Electric Traction*, a new G.E. MR circuit breaker for railway service has been developed, having better circuit rupturing characteristics than previous designs, due to a powerful magnetic blow-out and the use of arc suppressor plates as used in drum controllers. The rupture is complete in a case of short circuit in approximately .03 second, about half the time required by the previous breakers.

The breakers are used for both protection against overloads and short circuits, and as hand-operated main switches. They

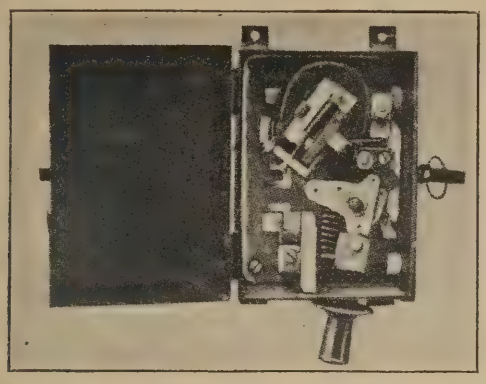

Fig. 2.—Quick-acting Circuit Breaker.

are light in weight and are enclosed in asbestos-lined sheet steel boxes.

A heavy compound base, held in the box by three cap screws, supports all the operating mechanism. Examination of the contact tips may be easily made by the removal of the arc chute, which is held in place by a single latch attached to the box in such a way that it can be moved only when the cover is open. All parts of the breaker are readily accessible for repairs or inspection. A view of the breaker is shown in fig. 2.

A New Tinning and Soldering Compound.

A patent compound called "Soldo," which automatically cleans as well as tins any metal except aluminium, has been brought to our notice by the SOLDO CO., of Sicilian House, Southampton Row, London, W.C.1. It is a greyish-white powder consisting of particles of pure tin mingled with a crystallised salt, slightly hygroscopic and is put up in moisture-proof tin boxes. We have tried this compound on a rusty iron wire and a No. 24 s.w.g. galvanised iron wire, without cleaning them in any way; heated in a gas flame, dipped in the compound (of which a small quantity adhered to them) and again heated and placed in contact, they were soldered together so effectively that when stretched the wire broke outside the joint. The makers claim that the compound is free from acid, and the tinning is permanent; moreover, interpenetration of the metals occurs to a greater extent than in the case of ordinary solder. In support of these claims they

Fig. 3.—Rusty Steel and Manganese Bronze Sections.

have had tests made at the National Physical Laboratory, whose report states that phosphor-bronze, "Ohmal" strip, manganese-bronze, steel, and cast-iron were all tinned with one application of "Soldo." Rusty steel and rusty cast-iron were also tinned with two or three applications of the compound, assisted by rubbing with a soldering iron. Comparative tests with workshop methods of tinning were made by microscopic examination of sections to ascertain the degree of interpenetration, which was found to be, in the case of phosphor-bronze, about twice as great with "Soldo" as with the ordinary method. "Ohmal" is usually hard-soldered on account of the difficulty of tinning it with soft solder, but was successfully tinned with the compound. In the case of manganese bronze the interpenetration was four or five times as great, and the sections of very rusty steel and cast-iron showed that the rust had been effectively removed wherever "Soldo" was applied, and interpenetration had been obtained, "illustrating in a marked manner the cleansing properties of the compound." Fig. 3 shows a section of rusty steel (×200) tinned with "Soldo" at *a*, rusty and untinned at *b*; and sections of manganese bronze (×350) at *c* and *e*, tinned in the ordinary way at *d*, and with "Soldo" at *f*, the greater depth of the copper-tin alloy being apparent in the latter case. For tinning the soldering bit we have found "Soldo" most effective, and with the bit so tinned a small joint can be soldered without further application of soldering flux.

An Electric Melting Pot.

Some particulars are given in *The Electrical News, Toronto*, of an electric melting pot which has recently been developed by HAROLD E. TRENT. The heating element is of nickel-chromium wire embedded in heat conducting electrically insulating refractory which, it is stated, is assembled under hydraulic pressure and secured to the bottom of the retort. It is claimed that this construction permits a temperature of 1,200 deg. F. to be reached. The heat insulation is a special cement for which high efficiency is claimed. A three-heat switch at the end of four feet of flat armoured cable protects the leads and facilitates installation.

The capacity of the pot is 30 to 35 lb. It is 10 in. in diameter and 8 in. high, and it weighs 36 lb. It is stated that 1,000 deg. F. may be obtained in 65 min., and 500 deg. F. in 35 min. The current rating is 1,200 W normal. It is especially adapted for melting tin, lead, zinc, babbit, solder, and type and needle metal.

Fig. 4.—The "Touchtone" Horn.

A New Electric Horn.

Fig. 4 illustrates the Tangent "Touchtone" electric horn, an industrial hooter which is being marketed by MESSRS. GENT AND CO., LTD., Faraday Works, Leicester. The horn can be supplied to operate on either a.c. or d.c. systems at any pressure up to 250 V, or on 6 V or 12 V batteries. The mechanism is encased in a hermetically sealed cast-metal case and is claimed to be flameproof, fireproof and water-tight. The electrical parts are well insulated and leading-in glands are provided for sealing the cable openings after insertion of the cables. No delicate or micrometer adjustments are necessary and it is claimed that permanent adjustment can be effected with an ordinary screwdriver.

An Electric-Light Bath.

THE HIGHBURY ELECTRICAL APPLIANCE CO., 57, Compton Road, Highbury, N.1, is about to put the portable radiant apparatus which we illustrate herewith, on the market. When open the appliance takes the form of a three-sided appliance which is intended to be inverted over the limb or part of the body requiring treatment. It is claimed to be perfectly rigid when

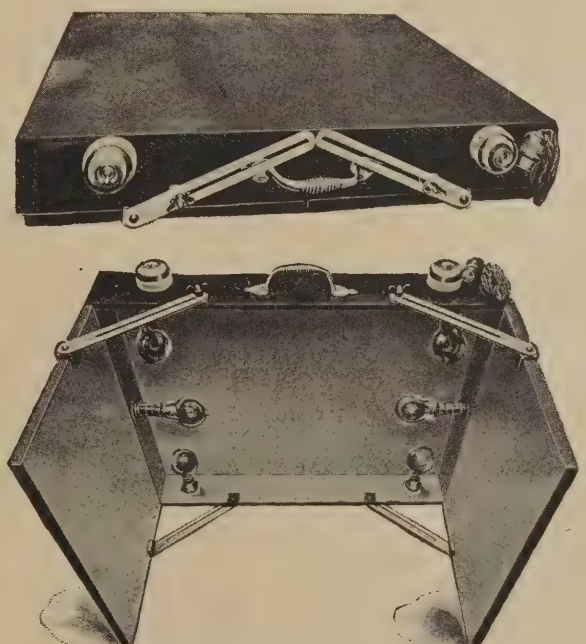

Fig. 5.—Electric-Light Bath, Folded, and Ready for Use.

in use, but is rendered portable when folded in a small compass similar in form to an ordinary suit-case. The apparatus is lined with sheet tin and is wired for six lamps with a consumption of about 800 W. The device is made in two styles, one with a mahogany case and the other of a lighter make in plywood for the use of the visiting practitioner.

Correspondence.

Correspondents should forward their communications **at the earliest possible moment.** *No letter can be published unless we have the writer's name and address in our possession.*

Power Factor.

As a reader of some years' standing of your paper, I think the article by "Stan Dard" in your issue of June 19th on "This Puzzling Power Factor" does not make for electrical progress. Why did "Stan Dard," if he desired his article to be a progressive one, not finish his subject with some of the simpler methods of ascertaining the power factor in electrical circuits? As one of your non-technical readers I should have enjoyed "Stan Dard's" article much better if it had been finished in that manner.

James L. Shiels.

Lenzie, *June 29th*, 1925.

[The article referred to dealt with the lighter aspect of the subject, and did not profess to discuss it from the technical point of view, for which we may refer our correspondent to the little book on "Power Factor Correction," by Mr. A. E. Clayton (Pitman's, price 2s. 6d. net).—Eds. Elec. Rev.]

Artificial Crop Drying.

In your issue of the 26th ultimo Mr. Borlase Matthews offers some remarks on an article published by you on the 12th ultimo on "Electricity in Agriculture." Referring to the hot-air process for drying crops, he observes that this has not proved itself in practice for ricks of over 25 tons. It may not yet have done so, but the maximum dried has been eighteen tons of finished material. But the implication that all practical farmers incline to stacks of this size is scarcely justifiable. Stacks vary in size in different parts of the country. Stacks of 10 to 14 tons (finished material) are quite as common in some parts as the larger stacks in others. It is also suggested that the hot-air process bases all its claims on one of two 8-ton stacks dried last year. Those two were experimental stacks—they were not demonstrations. Much was learnt from them and put into practice last year with the greatest success—some 250 tons of wet corn being dried in an average time of under an hour per ton. The method is being proved in a practical way by numerous demonstrations conducted by the Ministry of Agriculture, and practical farmers express no doubt as to the excellent quality of the hay produced. It is certainly better than that produced in the experiments conducted with cold air in 1923 by the Ministry of Agriculture, and it is more than doubtful whether the hot-air process is dearer, as Mr. Matthews seems to assume. It is certainly not so tedious, nor does it require the same care and attention as the cold-air method. It is quite true, as Mr. Matthews states, that no comparative feeding trials of the two artificial systems—hot air and cold air—have been made. Nor are they likely to be. Nor have there yet been any conclusive detailed feeding trials of either in comparison with ordinary hay. So far, however, as tests have gone, there is no doubt that in palatability the hot-air hay surpasses the best natural hay, and trials on milk yield show that milk production is considerably increased by replacing ordinary with hot-air hay, weight for weight. Chemical analysis has shown that fermented hay produced by the cold-air process is inferior in every respect to ordinarily weathered hay.

B. J. Owen, M.A., D.Sc.,
Director of the Institute of Agricultural Eng.
Consulting Engineer of the Ministry of Agriculture and Fisheries.

Oxford, *June 29th*, 1925.

Is there an Age Limit?

I have been engaged in electrical engineering for thirty-three years, for twenty-five of which I have acted as assistant and chief engineer of contracting and maintenance departments for municipal and engineering firms. Owing to the closing of a similar department with my last employers, I have been out of a definite berth for eighteen months, during six of which I have advertised, and made persistent applications with negative results.

I should be glad to learn if there is an age limit in this era for obtaining employment; perhaps some readers of a pioneering journal such as yours can give their experience or opinions on the matter.

L. P. Ives (Non-Union).

London, *June 30th*, 1925.

Cooking by Electricity the Ideal Method.

Herewith is an extract from a letter received from a prospective consumer:—

"Your surveyor can confirm that there is absolutely no provision in this house for cooking except with a gas cooker . . . the lack of cooking facilities is simply intolerable."

This seems to be a great tribute to electric cooking, that gas is simply intolerable.

K. A. T.

July 4th, 1925.

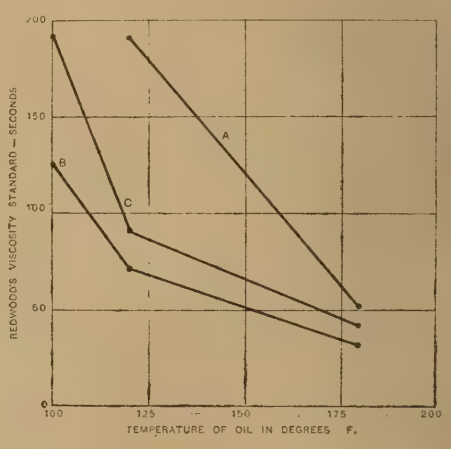
Installation Practice.

Your correspondent "Essex" is up against the old trouble of "Mr. Plumber" carrying out electrical installations, and while I am in full sympathy with your correspondent, I am afraid there is no redress. Some time ago the Electrical Review published a report from the *Melbourne Age*, wherein a plumber was fined for interfering with matters electrical. This, of course, happened in Australia, but in Britain it seems that anybody can do an electrician's work with impunity.

"Essex" states that a decorator and plumber (a strange combination) is carrying out electrical work and is being assisted in it by the burgh electrical engineer. If that is the case, the engineer must be a strange sort of individual, or perhaps the plumber-decorator is a relation of the former. I would suggest to "Essex," first, to ascertain definitely if the engineer in question is aware that the work is being carried out by someone other than a *bona-fide* electrical contractor. On making sure of his ground "Essex" could then report the electrical engineer to the proper quarters. If "Essex's" statement is correct it will be the first time I have heard of a burgh electrical engineer giving technical advice to a plumber. Most of the gentlemen that I have met are above that sort of thing.

A word of consolation to "Essex": the client who has employed the plumber to carry out his work will probably have to pay "through the nose," and also he will be obliged to call in a *bona-fide* contractor at the finish to do the work over again.

Contractor No. 2.



June 27th, 1925.

Lubricating Oil for Turbines.

The question of the best class of lubricating oil for steam turbines is most often left to the decision of the turbine makers; this is the wisdom of safety, at the same time acknowledging the lack of sufficient knowledge to specify what oil is suitable, and the physical conditions of the tests that should be conformed to.

Most turbines are provided with rotary displacement oil pumps; therefore, each revolution implies the same cubic capacity of oil being circulated; an ideal pump would be one that increased the amount of oil per revolution, depending upon its temperature. But as this is not at present attainable it behoves the operating engineers to obtain an oil having as flat a viscosity grade to temperature rise as possible.

Usually makers specify the viscosity in seconds at one temperature, generally 100 deg. F. This tells the operating engineer nothing. At least three readings should be required, corresponding to different temperatures; the flattest curves will usually indicate the best class of oil for the purpose.

I enclose the readings recently taken by myself for three oils, all guaranteed to be high-class turbine oils. I am not drawing the connecting lines as curves, which, of course, should be done but the straight lines show up the incongruity of the makers' statements.

The matter is of such importance to power station staffs that you will no doubt publish this letter, and it will, I hope, be the means of helping all round.

J. E. Stewart.

Swansea, *July 2nd*, 1925.

A British Institute of Radio Engineers.

I was very pleased to see Mr. Stanley's letter on this subject in your "Correspondence" columns of this week's issue.

In the first place, I would like to make quite clear the sense in which I have used the term "advanced *amateurs*." An "*amateur*" is one who does not engage in a pastime for personal gain, whereas a "professional" is one who relies upon his work wholly or partly as a means of livelihood. It will be seen that an amateur may be more skilled and even better trained technically than his professional brother. I cannot agree with Mr. Stanley's statement that the Wireless Section of the I.E.E. covers all the ground necessary; I only wish it were so.

If one will peruse a summary of all the papers read and discussed at the I.E.E. headquarters *and* local centres it will be seen that wireless forms a very small proportion of the subject matter.

My whole contention is that for the radio man this position should be exactly reversed, *i.e.*, he requires, say, 90 per cent. of the papers, &c., to be on radio matters and the balance on kindred electrical subjects. I think Mr. Stanley will appreciate this point if he will realise that radio matters are quickly becoming so important that they cannot simply be attached as a side line to general electrical engineering. These are not only my views, but are amply borne out in the correspondence Mr. Evans and myself are receiving daily.

If I may, I would like to amplify one statement in my original letter. I have actually discussed the matter with advanced amateurs *and professionals*.

If any further argument is necessary as to the usefulness of the above Society, I would ask why so many British radio engineers have joined the American Institute of Radio Engineers; surely if all these members had felt that the I.E.E. covered the ground they wanted, they would not have joined a society which, although it publishes excellent proceedings, does not hold any meetings or discussions in this country.

I am afraid also that the amateur societies in this country do not fill the bill; a technical society must not in any way be political or be concerned with such matters as broadcast programmes, &c. Please do not let there be any misunderstanding—the amateur societies have done and will do in the future good work, and it is not intended that this new society should encroach on their province. Also it would be an ideal condition if it were possible for the I.E.E. to take into its Wireless Section a number of workers at present barred. It would be well to bear in mind that a number of eminent scientists have, during their career, passed through what I have already called the advanced amateur stage. Please do let us avoid any "dog in the manger" policy; surely if the Americans can run a successful Institue of Radio Engineers as well as the American Institute of Electrical Engineers, we Britishers can do the same. It is a great pity that we were not the pioneers in the matter.

In conclusion, I would say that I have been in correspondence with a prominent member of the I.E.E. in London on this subject, and have also called at headquarters, it being our wish to act with the approval of the Council of this body. However, at the moment the matter in this direction must be considered *sub rosâ*.

J. Nelson.

Prescot, *July 4th*, 1925.

A Neglected Instrument of Precision.

I read with much interest the article entitled as above, which you published in your last issue. It is somewhat out of the usual run, and so, being different, attracts attention. The subject is one to which I have often given consideration and frequently tried to put into practice. It is, however, difficult amidst the pressure of ordinary work to find time to make some record of that work in writing—though I agree that it should be done, even if it means the burning of midnight oil. I have found that the very fact that records are put in writing facilitates one's work, for friends read it and discuss it, with the result that ideas are developed that facilitate further work and progress. Again, writing about a subject compels one to make sure that all the salient points are noted. To inspect a new machine and then to go away is one thing, but it is a very different thing if a description has to be prepared, for in the latter case the observation necessarily has to be more careful—thus one learns more as the result of writing. I have done a fair amount of writing, but still find it a difficult task to express matters clearly and logically in an interesting manner, though I feel that I am gradually improving. I always endeavour to get others to record their experiences for their own benefit and that of others.

As your contributor, Mr. Monaghan, says: "An engineering problem is not completely solved until the solution is available for the world at large." To-day that must be largely done through the written word.

R. Borlase Matthews.

East Grinstead, *July 4th*, 1925.

The Training of Power Supply Engineers.

I was very interested in the article of Mr. Bromley which appeared in your issue of June 12th but holidays have prevented me from commenting upon it earlier.

With some of the things he has said I am quite in agreement, but he has not succeeded in convincing me, nor do I think he will have succeeded with other engineers, that a two years' course in a manufacturing workshop is unnecessary. If there was one feature more than another in the E.P.E.A. Report on the Training of Engineers, which met with the most general approval amongst engineers throughout the country, it was the proposal that the trainee should spend at least two years in a manufacturing works before entering an electricity undertaking, as the latter was not the best place in which to acquire a good mechanical training.

Everyone will agree, of course, that a power-station engineer need not be an expert fitter, but he ought to know the best way in which to go about a job. Mr. Bromley admits this, but he is mistaken if he supposes that an engineer will possess this ability after having had only about twelve months on repair and construction work in a power station.

In the first place, the experience gained during this short period will be much too limited, and may even be confined to the carrying-out of minor repairs, whereas a longer period in a manufacturing works will enable the trainee to know something of the actual construction of an engine, turbine, or other piece of machinery, from start to finish. Also his attitude towards the carrying-out of an engineering job is likely to be much better if he acquires his mechanical experience in a works rather than in a station. In the latter a repair job must necessarily, in nine cases out of ten, be carried out as speedily as possible and those circumstances are not such as are calculated to develop thoroughness and accuracy.

Furthermore, if my own experience is anything to go by, I should say that many power stations are not equipped with the most up-to-date workshop machinery as are manufacturing works, so the trainee cannot hope to get the same acquaintance with modern methods in the former as he can in the latter. Expert mechanics are not always available in power stations, and even if they are, every experienced engineer knows that occasions frequently arise when he himself has to decide on the best way of carrying out a difficult repair job, and it is then that a good mechanical experience stands him in good stead.

With regard to his criticism that the training outlined by the E.P.E.A. is too protracted, I am unable to see that there is much in it. Under the scheme which he has outlined it is expected that the student shall have had a technical college training and preferably shall have taken a degree. This will mean a period of three years, and together with the time spent in an electricity undertaking will amount to a total of six years. Under the draft scheme of the National Joint Board the total may be six or seven years, according to circumstances.

With his remarks relative to the pecuniary disadvantages under which the engineering student labours as compared with the young medical or dental student, I am in entire agreement. The only remedy for this, however, is for electricity undertakings to shoulder some of the responsibility and thus provide sufficient inducement to youths entering upon the course marked out.

J. W. Thomas.

Manchester, *June 29th*, 1925.

Celluloid in Accumulators.

May I, through you, ask your anonymous correspondent whether he has made a great discovery, or whether he has only just heard of the material, commonly called "non-inflammable celluloid" which, as is very well known, has been on the market for many years?

If the latter is the case, your correspondent may like to know that as soon as this material was available, attempts were naturally made to use it for manufacturing cell cases.

It was, however, very quickly discovered that the material simply shrivelled up under the action of sulphuric acid, and was, therefore, quite useless for cell cases. It so happens that some years ago I demonstrated this fact to the Mines Department, and I still have the cell case—or rather the remains of it—with which I demonstrated.

I am more particularly interested in the cells of miners' lamps, and for some years I have developed and used ebonite cell cases as an alternative to celluloid—the choice being entirely with the purchaser.

It must be admitted, and has been admitted, that whilst the ebonite case has the advantage of being non-inflammable and easily handled it will not stand the same amount of ill-usage as celluloid, and is opaque.

I am sure that a number of your readers, including myself, will be most anxious to know whether your correspondent has now discovered a "non-inflammable celluloid," which will withstand the action of sulphuric acid.

Theodore Stretton.

Cardiff, *June 30th*, 1925.

The Electrocution of Rats.

As you have not published any reply to the letter on the above subject in your issue of June 19th, perhaps what I have attempted in this connection may be of interest.

I constructed a trap consisting of a baseboard of wood carrying on its face an annular metal ring 3 in. in width and about 9 in. in diameter on the centre line, with a concentric hole in the centre cut through the base board about 3 in. in diameter. Below this was fixed a metal dish containing the bait, consisting of pieces of cheese, apple rind, and drops of oil all floating in water. The leads from a 220-V single-phase alternating circuit were soldered to the ring and the dish. I calculated that the hind legs of the rat would be on the ring and his front paws, holding to the edge of the hole in the wood, insulated, so that he would get a current through the mouth right through the brain and body to the hind legs.

From the subsequent appearance of the straw I put down to camouflage the trap, I fancy the rat got the surprise of his life, but that was all, and I stopped up his hole whilst I proceeded to investigate the more remunerative business of the extermination of "rates" suggested by your printers' "devil" in the letter referred to.

June 29th, 1925.

Street Lighting in Bradford.

I desire to correct a misstatement in the report of my remarks in the discussion on street lighting at the Brighton I.M.E.A. Convention.

I am reported as saying that in Bradford we had appointed a lighting expert to advise a new Committee selected from the Watch and Finance Committees. What I said was :—

"The Chairman of the Electricity Committee and myself had suggested a scheme for complete lighting, and as it was too large an undertaking to do at once, it was suggested to take part in hand, taking the most important part one year, and afterwards to work from a centre until all was completed."

The misquotation I desire mainly to draw attention to is that the Committee is being advised by an independent expert.

As the matter at present stands, we in Bradford are awaiting reports from both the Gas and the Electricity Departments before the scheme is considered, so that it will be quite clear that I could not make the statement attributed to me, but what I did say was :—

"In my opinion the proper Committee to deal with street lighting was a Committee selected from the Watch and Finance Committees, so that the cost would be watched and also the Watch Committee as controlling the Police Force would be in the position through having their men in all streets of being at all times able to report as to the efficiency of the street lighting."

I was also very careful to state at the conclusion of my remarks my own personal opinion :—

"I feel very strongly that the time has come when there should be appointed in all towns of any reasonable size and which will warrant it a lighting superintendent, who shall be responsible and shall be in a neutral position between gas and electricity and who shall advise the Committee responsible for lighting as to the methods to be adopted. I am quite satisfied that not only would this make for better results from the lighting side, but also for economy, and it would remove any feeling between the two departments."

I must apologise for the length of this letter, but feel that under the conditions at present obtaining in Bradford as to the lighting of streets the correction should be made.

J. W. Longley.

Bradford, *June 30th*, 1925.

The London County Council Tramways.

Report for 1924-25.

At the meeting of the London County Council on July 7th, the Highways Committee presented its report on the working of the tramways for the year ended March 31st last.

This shows that the total income for the year was £4,229,837, as compared with £4,374,057 in 1923-24, while the working expenses rose from £3,518,362 to £3,754,140. There was accordingly a surplus of £475,697 (£855,695), but against this the cost of renewals amounting to £282,382 (£310,241) was charged, reducing it to £193,315, as compared with £545,454 in the preceding year. Owing to the temporary suspension of certain sinking fund payments the capital charges were considerably reduced, the amount charged against the surplus being £471,756, as against £705,676. In spite of this, however, the net deficit for the year was £278,441, as compared with £160,220 in 1923-24. This deficiency has been met to the extent of £40,604 out of the balance of the reserve fund formed from the surplus of £200,827 which accrued in 1922-23; the remainder has to be met by a special county rate.

The total net capital expenditure upon the undertaking amounted at March 31st last to £16,692,535, of which £436,721 represented expenditure during the past year. The amount of debt incurred up to March 31st was £17,025,583; the net debt outstanding, after allowing for repayments, sinking fund balances, &c., was £9,099,538. It is worthy of note that the amount of capital expenditure which had become obsolete owing to the electrification of horse tramways was £2,024,688, but this had been reduced to £751,215 by March 31st last.

The sum paid to metropolitan borough councils and the City Corporation for rates on the permanent way amounted last year to £59,933, in addition to £77,609 paid in respect of offices, car sheds, sub-stations, &c. The saving to the road authorities in consequence of the obligation of the Council to maintain the paving along the tramway routes was estimated at the end of the year under review to be about £240,000 a year on the present mileage. Debt charges in respect of street widenings amounted to £30,906. These three items, *i.e.*, rates on track, road maintenance, and street improvement charges, together amounted to £330,839, and various local rates were therefore relieved to this extent.

The traffic figures show that the inclusive length of track was 164.14 miles; the car-miles run during the past year totalled 68,068,216, as against 64,118,565; the number of passengers carried fell from 689,015,086 to 682,595,733; the average receipts per car-mile declined from 16.04d. to 14.63d.; and the average working expenses per car-mile rose from 13.17d. to 13.24d.

Published Specifications.

Compiled expressly for this journal by Patent Agents.
The name of the applicant's patent agent, if any, will be found on the printed specification.
The numbers in parentheses are those under which the specifications will be printed and abridged, and all subsequent proceedings will be taken.

Electricity Supply, 1920—1923.

IT is not often that a reviewer comes across a book containing 580 pages of tables out of a total of 628 pages, inclusive of the index, which he can honestly say is interesting. That such a book is imposing goes without saying, that it is valuable may be assumed, but that it is a book difficult to lay down when once one has dipped into it is a statement which may require justification. Yet this may truthfully be said of the "Return of Engineering and Financial Statistics of the Electricity Commission."* Upon any one connected with the electrical industry, and particularly with the central-station side of it, this volume exercises the same kind of fascination as does "Who's Who" or "Debrett" upon those whose titles to fame have been recently recorded. From the performances of his own undertaking, which he knows by heart already, the engineer will turn to those of the Newcastle-upon-Tyne E. S. Co. or of the Mynyddislwyn Urban District Council, whichever makes the most appropriate comparison, to see how they have been doing. It will then occur to him to look up the records of Little Puddlington-on-the-Marsh to see whether his old friend, John Dogsbody, really is running on 2 lb. of coal per kWh, as he said he was. Name after name will catch his eye, for the records of every authorised undertaking in Great Britain are given with "nothing extenuate nor aught set down in malice," and there will always be just one more undertaking whose records he wants to look at before he lays the volume aside.

At the risk of being tedious, it will be well to state as briefly as possible what the book contains. It covers the three years ending December 31st, 1922, or March 31st, 1923; one could have wished that it brought things down a little nearer to the present, but as the Commissioners are to issue a further Return as soon as possible, and hope to make the publication an up-to-date annual, criticism on this score is unjustified, particularly in view of the immense amount of labour involved in getting the work going at all. Concerning the subject-matter, it may be said that the return includes in all 543 separate authorised undertakings, of which 326 are local authorities and 217 are companies, though not all of these had started supply at the dates mentioned. What may be called the main tables occupy 549 pages of the volume. There are four main tables, the first two relating to engineering matters of local authorities and companies respectively, and the second pair to financial matters. The undertakings are arranged alphabetically for England, Scotland, and Wales, and each has an index number to facilitate cross reference.

* H.M. Stationery Office. Price 15s. net.

The engineering statistics comprise: (1) Nature and frequency of current; (2) voltage at generators and at consumers' terminals; (3) evaporative capacity of boiler plant; (4) type, capacity, and number of main generators; (5) maximum load on station during the year; (6) connected load at end of the year; (7) load factor of undertaking. This information is given on two facing pages. The next pair of pages contains: (8) lb. of fuel (coal or oil) per kWh generated; (9) units generated, purchased, and total; (10) units used in works; (11) units lost and unaccounted for; (12) units sold for (*a*) lighting and domestic purposes, (*b*) public lighting, (*c*) traction, (*d*) power, (*e*) bulk supplies, and (*f*) total. Next comes (13) population of supply area; and (14) units per head of population.

Still at the risk of tediousness, but out of fairness to the Commissioners, the contents of the financial tables must be mentioned. In these tables as many as six pages are required to accommodate the line of figures belonging to each local authority or company. As there are no fewer than 69 different columns of financial statistics, it is necessary to summarise them. Under the heading of "Expenditure Charged to Capital Account" we have 15 columns of details. The next pair of pages are devoted to revenue. We have the quantities of energy sold under the six headings of domestic purposes, public lighting, traction, power, bulk, and total, with, in each case, the revenue obtained and the price per unit. This accounts for eighteen columns, and the remainder on the page deal with revenue from maintenance of public lamps, rental of apparatus, sale of fittings, &c. The final pair of pages deal with expenditure on revenue account and appropriation of gross surplus. Generating costs are only subdivided into "cost of fuel" and "other costs." These, together with "current purchased," make up "total cost of energy," which is given in lump and per unit sold. Adding the figures for "distribution" and "management," we get columns for total working costs, both lump and per unit sold. Other columns give the expenditure on lamp maintenance, rent, rates and taxes, &c. Finally, there is a column for the gross surplus, followed by five more showing how it is disposed of.

One could really hardly ask for more in a work of this description. In the engineering tables it will be noted that there is no mention of the calorific value of the fuel nor of the thermal efficiency of the plant. In omitting data on these points the Commissioners are certainly wise. Nobody believes either the calorific value or the thermal efficiency declared by any station other than his own. The quantity of coal consumed per kWh is, however, an easily ascertainable figure, and as coal has to be paid for, the quantity burnt has to be known accurately. If the consumption of any particular station is high because a low-grade coal is used, the merit of the performance can be appraised by reference to the cost of coal per kWh generated, or sold, which, after all, is the real test.

The tables which form the bulk of the book have been referred to first, because they are of special interest to those concerned with the performance of individual undertakings. There is, however, a broader aspect of electricity supply which appeals strongly to those who, whether connected with the industry or not, are nevertheless interested in the progress being made in its development. Such readers will find their greatest pleasure in the thirty-two "summary tables" which come in the early part of the volume. These are extraordinarily good. Whoever laid down the lines of the book knew exactly what kind of information the general student of the electricity situation would like, and he has saved such students the trouble of digging out the data from a mass of irrelevant figures by doing it all for them.

The first of these summary tables classifies the whole of the 468 generating stations in Great Britain into 22 groups according to size, and gives the number falling into each group. It may be mentioned with regret that the largest group of 53 stations contains plant of between 1,000 and 2,000 kW capacity only, and that 328 stations, or over 70 per cent. of the total, are of less than 5,000 kW capacity. We then come to tables showing the number of steam turbines, reciprocating steam engines, gas engines, oil engines, and water-power plants installed. Another table gives the number of generating sets of various sizes; then we have particulars of the various voltages, frequencies, &c., in the country, and of the units generated, purchased and sold for three consecutive years. Other tables tell us how much of the total was generated by steam, gas, oil, or water. Undertakings are then classified in 13 groups according to annual output, and again in 15 groups according to units sold per head in their respective areas. Further tables show the number of undertakings with various maximum loads and various load factors. We are also told by tables how many plants there are in various groups, classified according to their fuel consumptions, and a dozen or more financial tables deal with expenditure and revenue. Among these, one, giving the number of undertakings selling electricity at various average prices, is particularly interesting. There is indeed hardly a table in the book a discussion of which would not form a subject for a long article. Such articles may be written later. The present object is merely to call attention to the existence of the book and to indicate the nature of its contents. It is a production which is a credit to the Commissioners in every way, and the enormous labour which its compilation must have cost is abundantly justified. Taking it in conjunction with the Return of Administrative Particulars issued in January last, we have to thank the Commissioners for placing at the disposal of the electrical industry the most exhaustive information with regard to the statutory electricity supply undertakings of Great Britain that could possibly be obtained.

Prosperity and Problems.

In his annual speech to shareholders of the General Electric Co., Ltd., which is reported elsewhere in this issue, Sir Hugo Hirst, the chairman, mentioned with justifiable satisfaction that the profit for the year had reached a record, standing for the first time at over a million sterling. The company has resisted the temptation to make a large distribution on the ordinary shares, preferring rather to hold liquid resources at command in readiness for taking advantage of the opportunities which a progressive industry presents for re-investment. The speaker hinted at some scheme or other which may be introduced at a not too distant date for lightening the heavy burden of debenture charges. He also once more expressed the view that is held by all the best-informed minds that, "electrically speaking, we are only at the beginning of things." If that description of the situation be correct when the company operates profitably with a capital of £9,000,000, it is impossible to suggest to what figure the capital of this and other such concerns may ultimately reach as the vast anticipated electrical progress reaches it full development. We cannot, however, look only to the future, for present problems press heavily and demand attention. Sir Hugo Hirst and his colleague, Mr. Railing, have been investigating Continental industrial working conditions, and some of the conclusions arrived at are stated in our report. But most noteworthy of all the subjects touched upon in the speech was that of international electrical co-operation to which we have referred on several occasions in these pages. It is considered that whether we succeed in solving our present difficulties or not, the fact must not be ignored that the absorbing power of the world at the moment is insufficient when compared with the power of production which under war-needs each country increased to double its normal requirements. Sir Hugo advocated international collaboration in facing this situation. What he termed "industrial steadiness" can be gradually recovered and steady recovery of the world be helped, only by the big industries of the principal countries putting their heads

together to discuss standardisation, working conditions, and the sharing of markets. He referred to the difficulties, political and industrial, that might be anticipated if "wild competition" between countries were to be allowed to go on unchecked and in the spirit of the "survival of the fittest."

Argentina—An Important Market.

THE statistics relating to Argentina's imports, which are given in this issue, show that there was a large and fairly general increase during 1923 as compared with 1922. Upon the whole, however, the share of the United Kingdom was not of such satisfactory dimensions as in 1922; both Germany and the United States appear to have increased their proportions at a much greater rate. In some cases we lost ground during the year, notably with regard to accumulators. In this case our exports to Argentina were about halved, while the United States' share was doubled, although we remained the principal suppliers. As regards electrical accessories, in 1923 we ceded the first place to Germany, who increased her contribution by over 60 per cent., while our increase amounted to only about 20 per cent. The United States passed us in the telephone apparatus section, although both our own and Germany's contributions showed a considerable increase. Our supplies of porcelain insulators were almost on a par with Germany's in 1922, but in 1923 our competitors left us far behind. On the other hand, we made a satisfactory advance in respect of the largest item—wires and cables. Although in actual figures Germany's increase was greater, proportionally the position was much more satisfactory as the United Kingdom's share was more than doubled. This country again headed the list in the item "Materials for cells or storage batteries," and a larger advance than those of our principal competitors was recorded. Under the heading "Insulating tubes" we increased our exports by 72,000 pesos, thus ousting Germany from the first place; and the United States fell behind the United Kingdom in the case of switchboards, we having exported six times the 1922 value. We remained behind Germany, Italy, and the United States in our exports of dynamos and motors, the outstanding feature of this section being a very large increase in the German share. We managed to supply more incandescent lamps during 1923, but our figures are small compared with those of Germany and Holland. In another large item, unspecified electrical material, we kept pace with Germany and the United States. The method of classification adopted appears to lead to overlapping or redundancy in some cases, but it must be remembered that it is the official Argentine system.

Electro-Farming at the Chester Royal Show.

IT is a noteworthy sign of the times that so much attention has been paid to the applications of electricity at the farmers' premier show—that of the Royal Agricultural Society of England—at Chester this year. For the first time in the history of this important event a complete public service of electricity was available, and more than 50 stands were using electric current in one way or another. (Of course, there was no demand for lighting in a midsummer show that closed at 8 p.m.) Of the enormous crowd that attended the show, hardly any noticed the overhead distribution lines, which blended well with the low stands, and relieved any feeling of flatness. Incidentally, the Chester Corporation supplies a large rural area, and already has 30 farmers connected to its system. This enterprise is due to Mr. S. E. Britton, city electrical engineer of Chester and ex-president of the I.M.E.A. As Sir Hugo Hirst is on the Committee for next year's Royal Show—which is to be held at Reading—we may rest assured that electricity will be well represented there also.

Another landmark associated with this show was the holding of the first British Electro-Farming Conference in the main conference tent of the Society. The meeting was organised by E.D.A. The chair was taken by the Right Hon. Lord Bledisloe (Secretary in the House of Lords to the Minister of Agriculture). Mr. S. E. Britton opened on behalf of the electricity supply industry, and Sir John Russell (head of the Rothamstead Agricultural Experimental Institute) put the case from the point of view of the agriculturist. Mr. R. Borlase Matthews followed with some notes based upon the actual practical use of electricity in farming work, incidentally announcing a new commercial discovery in connection with the use of electric light for stimulating plant growth. Mr. J. W. Beauchamp then explained the underlying basis of the Conference. Most countries now have special electro-farming conferences, and it is pleasing that this country is not neglecting the matter. There are rumours of an International Electro-Farming and Rural Electrification Conference being held, and it is hoped that it will take place here, now that a start has been made with a home meeting.

In the current issue of the *Journal* of the Royal Agricultural Society of England, a report made by Mr. C. Dampier Whetham appears, as the result of an inquiry made by the Research Committee of the Society. This is another straw which shows which way the wind is blowing. It is a very painstaking and impartial summary of the position of electro-farming in England, though it goes a little astray when questions of electricity supply are considered.

In the columns of the ELECTRICAL REVIEW the case for electro-farming has always been supported. There have been many doubters, and there is still a long row to hoe; however, this Chester Show has focused attention on the subject, and should give great encouragement to the pioneers in this important work. Moreover, the electrical industry generally has been given a very broad hint as to the huge field of work that is opening out for it.

The Southern Railway Electrification.

THE inauguration of the new electric train services on three sections of the Southern Railway on Sunday last was a notable event, opening a new era for one of our oldest railway systems—that known as the South-Eastern and Chatham Railway before it was absorbed in the amalgamation scheme. The South-Eastern suburban system for many years stood in need of conversion to electrical operation, but suffered from lack of capital and credit which prevented the directors from embarking on so costly an enterprise. Latterly its rolling stock depreciated to a marked extent—not only the locomotives but also the passenger coaches, many of which were of antiquated design and construction, and were most uncomfortable; much of the decay was due to the very heavy traffic which these railways had to cope with during the war. Consequently the introduction of brand-new easy-running coaches is almost as gratifying to the passengers as the adoption of electric haulage and the accompanying improvement in speed and in the scheduled service. In passing, we may say that whilst the old S.E.R. bore a bad reputation for time-keeping, it was far from justified, and the frequent jocular references to its leisurely ways were based upon conditions that long ago ceased to exist; we can vouch for its generally high standard of punctuality.

The operation record of the first week-day was unfortunately marred by a number of hitches, none of which was of importance, but which gave rise to a good deal of inconvenience and delay; the trouble was partly due to the simultaneous introduction of a new time-table, which added to the difficulties of the railway staff. There were nine failures of apparatus in 450 journeys, and most of these were attributed to the binding of the brake mechanism, with the result that the trains could not be restarted, and in some cases the main fuses in the motor compartment were blown owing to the attempt to get away overloading the motors. In the course of a week or two the equipment will be in better running order, and we anticipate that the electrification will prove as successful as that of the other Metropolitan services. It is satisfactory to record that there was no failure of the power supply, which is derived from the Deptford generating station of the London Electric Supply Corporation.

D

The Science Exhibits at Wembley.

The Royal Society's Display in the Government Pavilion.

THE Science Exhibition at Wembley forms part of the British Government's participation in the British Empire Exhibition, having been organised, with funds provided through the Department of Overseas Trade, by a committee appointed by the Royal Society under the chairmanship (1925) of Mr. F. E. Smith, C.B.E., F.R.S. In many cases the exhibits, the majority of which are working demonstrations, are shown by the gentlemen actually engaged in the work and are supplemented by apparatus loaned by some of the leading scientific instrument makers.

The arrangement of the principal section of the physical exhibits is based on the extended spectrum of electro-magnetic oscillations and radiations, the experiments illustrating the phenomena met with in the different regions of the spectrum. As a key a large chart shows, in a manner which appeals to the eye, the whole range of radiations now known to be electro-magnetic. According to classical theory, all the types of radiation mentioned on the chart are propagated as strains in the ether of space with a constant velocity which is approximately equal to 30,000,000,000 centimetres per second. There is every reason to believe that the radiations shown on the chart, from the shortest gamma-ray having a wave-length of only 0.000,000,000,2 centimetre up to "wireless" waves having a wave-length of 500,000 centimetres, travel in space with this fixed velocity and that, although their effects are very diverse, the only fundamental difference between the many types of radiation studied lies in the wave-length. The whole range of radiations is divided for convenience into groups; within any group the radiations are similar in their characteristic effects and properties, and the same methods may be employed to detect and produce a wave of any length within a group.

Since a chart in which the lengths of the lines are made proportional to the wave-length would circle the earth very many times, a scale of octaves has been chosen, an octave implying that the numerical value of the wave-length has been doubled. The chart shows about 60 such octaves, and there is an unbroken series of radiations increasing in wave-length from gamma- to X-rays, through the ultra-violet and the visible rays to the infra-red, so to the Hertzian and "wireless" waves, finally ending with the very long waves corresponding to relatively slow electrical oscillations. The wave-lengths are given in centimetres and in Angström units. One Angström unit is equal to 0.000,000,01 centimetre. It is only recently that radiations have been discovered corresponding to all the wave-lengths shown on the chart.

"Wireless" Waves.

Prof. R. Whiddington, F.R.S., demonstrates standing electric waves on a pair of taut wires by association with a closed circuit excited by a spark gap and transformer, *i.e.*, Lecher's system, making use of continuous oscillations sustained by valves. The length of the wires has been chosen for resonance (wave-length, 1 metre), and the standing waves are detected by bridging the wires with a flash lamp. In the usual case of a radio aerial, only part of one wave is formed.

Amongst the numerous exhibits of the National Physical Laboratory is apparatus for determining frequency and wave form (Mr. D. W. Dye). A steadily vibrating tuning-fork, having a frequency of 1,000 vibrations per second, produces, with the aid of a valve amplifier, a circularly-rotating ray in a cathode ray tube which forms the time base. The source of "wireless" frequency oscillations is caused to operate on the ray so that, in the absence of the large circular movement, a small circular movement of the ray is produced at the "wireless" frequency; by carefully adjusting the latter, the light spot in performing its looped journey round the time circle can be caused to arrive at exactly the point from which it started. When this occurs the light spot continually retraces the same path, forming a stationary looped figure. If the two circular motions of the light spot are in the same direction, the ratio of the frequencies is equal to the number of loops minus one. The setting of the "wireless" frequency to a known value consists, therefore, in producing a stationary looped pattern, counting the number of loops, and adding one. By suitable means the time trace can be made a long ellipse. If the "wireless" displacement is adjusted to be a straight line perpendicular to the long axis of the ellipse, the wave form can be examined. Other apparatus (Dr. R. L. Smith-Rose) illustrates the principle of a rotating closed-coil direction finder, while Dr. R. L. Smith-Rose demonstrates the heating effect of the currents induced in a coil by a "wireless" wave by the inclusion of a small glow lamp in the circuit of a receiving coil; the magnitude of the current is approximately indicated by the temperature of the filament.

Other N.P.L. exhibits are a wave-meter showing resonance, rectification by crystals, and the delineation of damped radio waves, while interference is shown between two wave forms from two independent valve oscillators, which are simultaneously projected upon the screen of an oscillograph. If the two frequencies are adjusted so that each is an integral multiple of the tuning-fork frequency, they will interfere with a difference frequency, which is also an integral multiple of the fork frequency. The pattern produced will therefore be stationary and hence visible. By making the amplitudes of the two waves equal, the combined wave will swell up to a maximum and then die down to zero as the waves first reinforce and then oppose one another. If the two waves are unequal, there is a swelling-up and dying-down of the wave of a kind very similar to that produced by modulation at the frequency equal to the difference between the two radio frequencies.

The research laboratories of the General Electric Co., Ltd., shows the bombardment of the anodes of two-electrode valves by electrons and also the change in temperature distribution along an emitting filament. A long thin filament is surrounded by an anode of grid form, and is heated by d.c., being normally of uniform temperature; when a d.c. voltage is applied between filament and anode, and an emission current is taken from the filament, the temperature at the negative end increases visibly and decreases at the positive end. This effect may have serious consequences on the life of a filament. A rectifier is shown rectifying alternating current, and the filament is heated from the same source, but the phase of the filament current can be changed by means of a phase-shifting transformer. When the filament current is in phase with the anode voltage, one end of the filament is always negative when emission current is flowing, and consequently is overheated. When the phase is shifted 90 deg., overheating disappears, for now each end of the filament is equally negative and positive when the emission current is flowing. On shifting the phase another 90 deg., the other end of the filament becomes overheated. A modern development of the original Wehnelt cathode is shown in the form of a cylinder of nickel, coated with mixed oxides of the alkaline earths, heated to a dull red by radiation from an enclosed tungsten filament.

Dr. J. A. Fleming, F.R.S., has a show-case containing specimens of his original rectifying valves, together with examples of modern valves of various types and sizes, contributed by the Mullard, Edison Swan,

B.T.-H., and M.O. Valve Companies. An interesting specimen is the M.O. dull-emitter type DET2 transmitter, which is capable of dissipating 40 watts continuously; its filament voltage is 6 V and current 1.9 A, with an anode voltage of 1,000, a voltage amplification factor of 8.5, and an anode impedance of 5,000 ohms. As a contrast, mention may be made of the Philips-Mullard metal-glass, water-cooled, type Z82 valve that has a maximum output of 50 kW; its filament voltage is 17 V and current 80 A, the anode voltage being from 5,000 to 15,000 V.

Prof. R. Whiddington, F.R.S., exhibits an electrical ultra-micrometer that was devised in 1919-20, which represents one of the many possible applications of the thermionic valve to physical measurement. The principle involved is extremely simple; when the distance between the plates of a parallel-plate condenser is slightly altered, its capacity changes in a way readily calculable, the capacity change being the greater the closer the plates. This change in the present case is observed by noting the change in the high-frequency oscillations maintained by a three-electrode valve in an inductive circuit containing the condenser. The condenser is linked to a spherical ball bearing, so that variations of the diameter of the ball in different directions may be observed. A null method is employed, and by the restoration of the original frequency of oscillation the diameter variation may be computed. The manner in which the restoration is effected is to apply a small bending moment to the stiff bar carrying the movable condenser plate by depressing one end of another much lighter bar through an observed amount. From the observed depression required to restore the original frequency the diameter change can be calculated. While the instrument shown is intended only to indicate changes of about one-tenth millionth of an inch, it has been found possible under favourable conditions, with apparatus of different design, to detect changes of so little as 1/200 millionth of an inch.

(To be concluded.)

An All-Electric Housing Scheme.

The Gateshead Corporation Enterprise.

CONSIDERABLE enterprise has been shown by the Corporation of Gateshead in providing all-electric labour-saving dwellings at inclusive rentals covering the whole of the electrical equipment. Provision has been made for the erection of 200 such houses, 38 of which have already been completed and are occupied. We learn also that at a recent meeting of the Gateshead Corporation it was decided to equip a further 138 houses on "all-electric" lines.

Different sized dwellings, comprising three-, four-, and five-apartment houses, constitute the general scheme. The average cost of building the houses is approximately £530, and they are let at rentals, inclusive of rates and electrical apparatus, of from 10s. 6d. to 15s. 6d. per week according to size. Each house is equipped with eight to ten lighting pendants (according to size); a 15-A combined switch plug for heating in each room, and one 2-kW radiator for heating; an electric cooker suitable for the requirements of a family of six persons; an electric domestic wash boiler; and a 25-gallon hot-water storage tank, this being fed from a boiler behind the semi-parlour-type of coal-fired range installed in the kitchen, and equipped with a 3-heat control auxiliary electric water heater. Both the wash boiler and the water heater are controlled by main and regulating switches, mounted on the same board as the cooker main switch, in the scullery. An "Osglim" lamp is arranged in circuit to indicate when the wash boiler and the water heater are in circuit.

Portion of Kitchen, Showing the Heating and Water-Heating Apparatus.

The whole of the installations were carried out by direct labour, and have been fitted in accordance with the very latest practice, only the best of materials and workmanship being employed. Energy is supplied at 250 V a.c., and a special sub-station, fed at 6,000 V, has been erected near the centre of the area occupied by the housing scheme. A separate transformer, together with an automatic time switch for its control, is part of the sub-station equipment to provide a street-lighting network at 110 V.

The scheme was prepared by the County of Durham Electrical Power Distribution Co., Ltd., and its successful conclusion may be attributed in a very large measure to the foresight of the Gateshead Corporation Housing Committee, of which Alderman H. Kegie is chairman. Credit is also due to the borough surveyor, Mr. M. P. Pattinson, and his assistants responsible for the actual building operations and electrical installations.

A portion of a kitchen, showing the semi-parlour type coal range, electric fire, and the electric circulating-water heater installed in the cupboard, is seen in the accompanying illustration.

The following are figures of the tariffs extended to the tenants and the estimated consumptions and costs which can be taken as fairly reliable for average conditions. These expenditures are compensated for by the saving effected by the elimination of fireplaces, chimney breasts, flues, and alternative equipment.

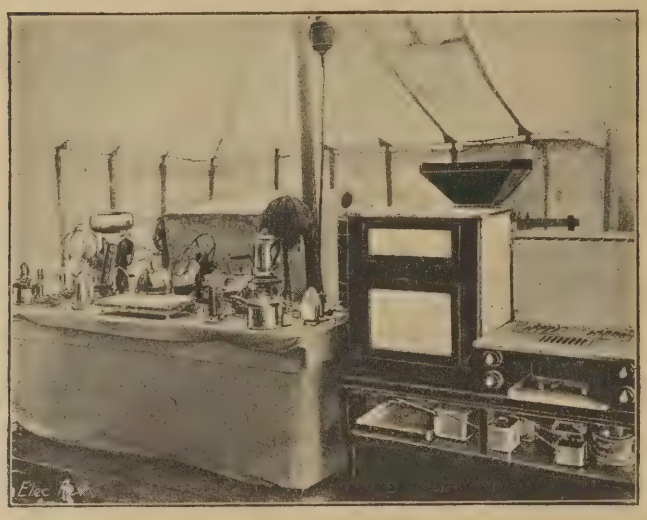
TARIFFS.

	Fixed monthly charge.	1—2,040 kWh.	kWh beyond 2,040.
5-roomed house ...	4s. 6d.	1d.	¾d.
4-roomed house ...	4s. 0d.	1d.	¾d.
3-roomed house ...	3s. 6d.	1d.	¾d.

ESTIMATED CONSUMPTIONS AND COSTS.

	Ltg. kWh	Ckg. kWh	Boiler. kWh	Elec. iron. kWh	Total kWh	Cost per week.
5-roomed house	133	1,830	250	26	2,239	4s. 10d.
4-roomed house	112	1,650	250	26	2,038	4s. 2d.
3-roomed house	98	1,500	250	26	1,874	3s. 10d.

Whilst heating and water heating are not included in the estimated costs, it is important to note that these may come within the lower charge of ¾d. per unit.



The actual costs of the complete electrical equipment, including wiring, &c., for the different types of dwellings are:—

5-apartment house	£47 12s. 6d.
4-apartment house	£45 0s. 0d.
3-apartment house	£42 7s. 6d.

Electricity at the Royal Agricultural Show.

Practical Demonstrations of Electrical Methods of Farming.

THIS year's Royal Show, held at Chester last week, has established direct contact between the electrical engineering and the agricultural industry, from which, it is hoped, far-reaching results will accrue. There was a profusion of electrical exhibits and working machines, and on the morning of Wednesday, July 8th, an important Conference on Electro-Farming was held on the Show Ground under the chairmanship of Lord Bledisloe. At this Conference several points of view converged: those of the electrical engineer, as expressed by Mr. R. Borlase Matthews; the agricultural scientific experimenter, Sir John Russell; and the agriculturist, Lord Bledisloe. The Conference was attended by several agriculturists interested in the possibilities of the application of electricity to the farm. Viewing the discussions in perspective, one is compelled to take

Part of the Exhibit of the Chester Corporation Electricity Department.

cognisance of the gap that exists between the points of view of the electrical engineer and the farmer, and it seems that only in proportion to the narrowing of this gap is progress in farm installations likely to be registered. Interviews with people attending the Conference confirmed this impression, and although varied opinions were expressed as to the probable outcome of the Conference, upon one point there was noteworthy unanimity, namely, that electrical engineers will have to tackle their problems with the fact in mind that the average farm worker is unversed in even simple mechanics. The engineer's problem is to evolve appliances which are simple, reliable, foolproof, cheap, and almost proof against rough usage. Another important point is flexibility. The horse, it was explained, is so adaptable to farm service that it has become the unit by which are judged the relative merits of the various forms of power, and if electricity can be proved to be quite as elastic and cheaper, there is no gainsaying that there is an enormous scope for it.

This year's Royal Show was epoch-making from another standpoint: it was the first show at which electricity was supplied for driving machinery. The Chester Corporation, on the recommendation of the City electrical engineer, Mr. S. E. Britton, supplied energy free of charge, and close on two miles of overhead lines were erected. Agriculturists had the opportunity of comparing the electrically driven unit with that driven by oil engines, tractors, &c. One suggestion might here be usefully made, namely, that at subsequent shows manufacturers of electrical appliances should arrange among themselves for a compact exhibit showing under one roof what can be done by electric power. Why not a model dairy, electrically equipped? In view of the stimulus that is being applied to the dairying industry to provide Grade A milk, the employment of electrically driven plant would be almost continuous, and not subject to those factors of irregularity frequently unavoidable with other farming processes.

The up-to-date farmer uses machinery for practically every purpose of the field, dairy, and shippon, and although horse power has not yet been superseded, apparently there is a great divergence of opinion amongst farmers as to which is the most suitable form of motive power—gas, oil, or electricity. In the development of farm machinery the Royal Show has always had a great influence, and at this year's Show there were no fewer than 30 entries of entirely new patents. The implement stands attracted great attention, and those that were equipped with electricity for driving exhibits formed quite a pleasant contrast to those distinguishable by the noisy thud-thud of oil engines. Exhibitors of machinery with the electrical drive had abundant opportunity of giving demonstrations to farmers of the positive advantages of electricity on the farmstead, and if for no other than propaganda purposes, the sources of information which were thus opened should yield, if not immediate, then certainly ultimate, positive results. Motors for practically every purpose were on view, and although the electrical exhibits lacked compactness through being so scattered, the start which has been made to show the usefulness of the electric drive for every farm purpose will no doubt lead to improvement at subsequent shows.

The Chester Corporation did its share of the pioneering work with a spirit of generosity. Not only did it run up transmission lines the whole length of the showground, but it also supplied motors and numerous accessories, together with energy free of charge to exhibitors. The Corporation's own stand was visited by thousands of persons each day. This tent was surrounded by a practical demonstration of the construction of 6,600-volt overhead transmission lines, the pressure being transformed down to 400 volts, and the current afterwards distributed by low-pressure lines equipped with the necessary switchgear. If anything, the Corporation's exhibit, at which were given demonstrations in the use of cookers, washing machines, vacuum cleaners, ironers, &c., was rather too small for the crowds that visited it. Not only was an appeal made to the interest of the housewife, but also to the farmer, amongst the machinery on view being a chaff cutter, root cutter, churns, milk separator and refrigerator belt-driven from electrically driven shafting.

Although space will not permit in this issue of giving a detailed description of the numerous stands, one of them, that of Messrs. Young, Osmond & Young was outstanding. It was almost completely electrical, there being close on two dozen electrical exhibits, chief amongst which was a 15-h.p. motor running at 420 V d.c., and an alternator supplying current for operating (1) a 3-h.p. squirrel-cage motor for driving a combined grinding and crushing machine; (2) a 5-h.p. squirrel-cage motor driving barn machinery.

From this source of power there were numerous other applications, such as a shearing machine, electrically heated incubator, a kibbler, electrically heated hay-drying equipment, a pump, a butter churn, fans, irons, kettles, refrigerators, milking machines, &c. An electric tractor with caterpillar tracks was also shown; a length of cable was employed, paid out or wound up according to the position of the tractor. This machine is to undergo practical field trials after the Royal Show. Another interesting exhibit was that of Messrs. Ransomes, Sims & Jefferies. They showed a 15-h.p. motor driving a thrashing and finishing machine.

(To be continued.)

The Use of Gas Coke for Raising Steam.

The Results obtainable on a Commercial Basis.

By E. W. DICKINSON, M.I.E.E.

THE closer accord during the past few months between the prices of gas coke and steam coal is once more arousing interest as to the possibility of using coke for raising steam. Since this relationship is likely to be maintained as a result of steadier Continental conditions, an even greater interest is to be expected in industrial circles generally and amongst power-station engineers especially.

A few notes, therefore, on the properties of gas coke and some information as to the conditions needed for efficient combustion as found in actual practice on chain-grate or travelling-grate stokers of the class now used in most power stations will not be out of place, and may form a guide to those engineers contemplating its introduction as a steam raiser.

It is perhaps asking a little too much of a responsible engineer in the present-day stress of close competition from all quarters to approach the question of burning coke solely from a "national fuel conservation" point of view when this view does not coincide with some immediate or not too remote advantage to the undertaking over which he has charge. Nevertheless, he can always have the national point of view in mind, so that, whenever national and individual interests synchronise, he will be prepared to grasp the opportunity as it arises. It must be admitted that national economies in our fuel reserves can only be made by national action, and this action requires both healthy public opinion and purse as a preliminary to effective legislation.

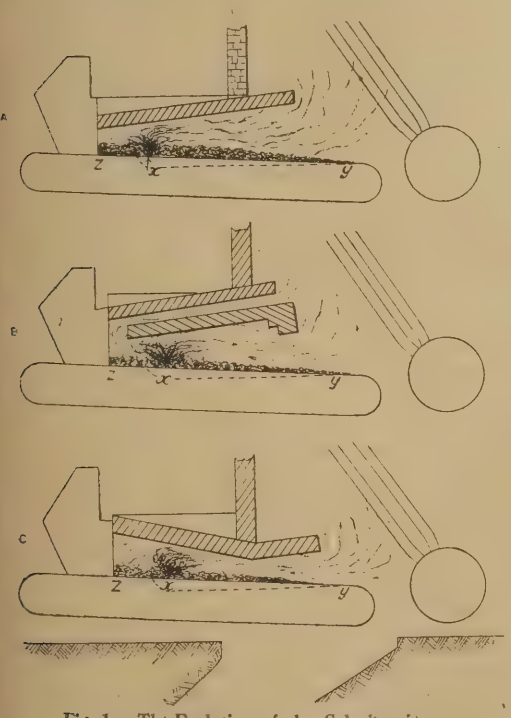


Fig. 1.—The Evolution of the Coke-burning Furnace (Coke alone).

Any extension of the uses of coke is to be welcomed not only as an outlet for an occasional, but inevitable, surplus production, but also as a means of reducing the cost of steam raising for manufacturing purposes, and at the same time conserving the nation's fuel resources.

Gas coke is an important product of gas manufacture, containing over 50 per cent. of the thermal value of the coal carbonised and in itself having a calorific value of 12,500 British thermal units per lb. when dry. The physical form and characteristics of coke as it leaves the gas retort are well known, and need not here be stated at any length. It is, after quenching (with regrettable loss of sensible heat), a hard and gritty substance, the fragments being usually of considerable size and requiring to be broken or cut to approximately the size of a walnut before being suitable for burning on chain- or travelling-grate stokers. Coke of this size requires about 75 cu. ft. per ton storage accommodation, and has an angle of rest of about 40 deg. with the horizontal. It requires approximately an ignition temperature of 1,200 deg. F. A typical analysis of gas coke made from Durham coal and arrived at from determinations taken over a considerable period is as follows:—

	Per cent.
Moisture	8.50
Volatile matter	1.85
Fixed carbon	77.80
Ash	11.85
	100.00

Calorific value, dry, 12,550 B.th.u. per lb.
Calorific value, as received, 11,480 B.th.u. per lb.
Calorific value, net, 11,370 B.th.u. per lb.

The point arresting attention is the low volatile content of this fuel, for whereas steam-raising coal as a rule is found to contain about 30 per cent. of volatile matter, that of gas coke ranges from 1.5 to 2½ per cent. This is at the same time both a disadvantage and an advantage. It is a disadvantage, when considering the adoption of coke alone, because volatile matter distilled from green coal and properly burnt forms a quick and easy means of keeping the furnace brickwork at the required temperature level for igniting the constantly incoming fuel, as it is drawn into the furnace by the stoker mechanism. On the other hand, provided that ignition difficulties are overcome, the absence of hydrocarbons eliminates one of the chief difficulties of fuel combustion. It is one of the ever-present problems of the combustion engineer so to regulate the air supply to coal distillates as to obtain intimate contact throughout between the oxygen of the air and the hydrocarbons. He must not, however, overdo it and bring down with excess air both his CO_2 and his furnace temperature. This difficulty, when coke is burnt alone, being surmounted, very high CO_2 readings are obtainable with resultant good evaporation.

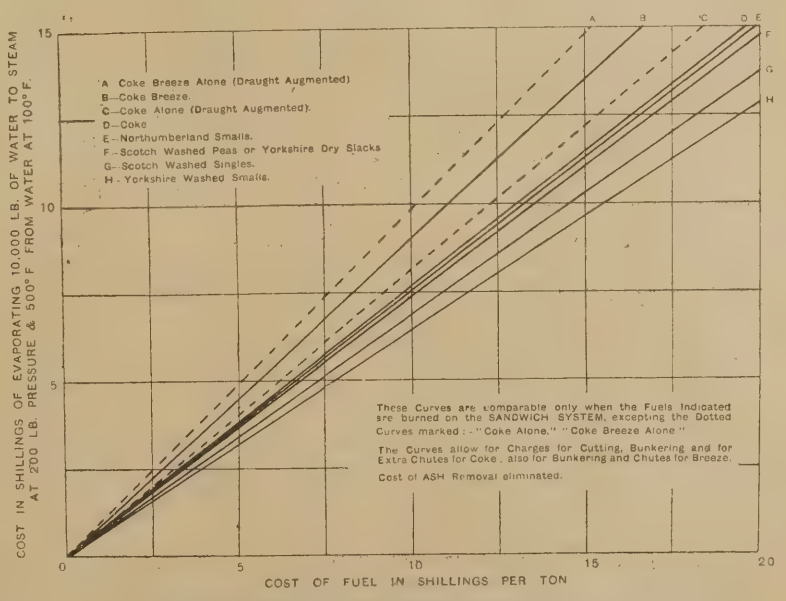

Fig. 2.—The Evaporative Value of Coke compared with that of other Fuels, burnt on travelling grates, with natural draught.

The problem of burning coke alone was approached by the writer in 1916 when in control of a London power station. In 1917 four 5-drum Stirling boilers, each having a heating surface, including superheater, of 3,650 sq. ft. and running at a steam pressure of 200 lb. per sq. in., were equipped with two Underfeed class "A" travelling-grate stokers, each stoker having a grate area of 50 sq. ft. The furnace brickwork setting, being an attempt to design a furnace to burn other fuels as well as coke, was first arranged as per sketch "A," fig. 1, being a simple arch 9 ft. long, rising from a height above grate-level of 10 in. at the hopper end to 30 in. at the boiler tube end; the forced-draught air supply of $1\frac{1}{8}$ to $1\frac{1}{4}$ inches of water was at a maximum at the portion of the grate marked *x*, tailing off to zero at the point *y*, as indicated by the dotted line, and standing at zero between *x* and the hopper end *z*. After preliminary heating of the brickwork by means of a coal fire to ensure a satisfactory start, the brickwork nearest the hopper, unfortunately, gradually cooled down owing to more heat being extracted from the brickwork by the fresh fuel entering than was returned by the reflected heat from incandescent fuel at the rear end of the grate. This resulted in the fire going out after a few hours' run.

Difficulty in maintaining preliminary ignition of the coke as it entered the furnace led to the use of a contra-flow design (arrangement B, fig. 1), by means of which the hot gases of combustion were led to impinge on the incoming fuel, with greatly improved results in so far as it was possible with care to maintain ignition. Finally, by the more simple means of a reverse inclined arch (arrangement C, fig. 1), which reflected the heat from the more intensely incandescent portion of the fire bed at *x* to point *z*, the difficulty was entirely overcome. There remained then only a minor problem, but one that had been manifest during the trials, *viz.*, that of the more complete combustion of the unburned carbon in the ash. This problem was well on the way to solution when in March, 1918, the experiments in burning coke alone were abandoned in favour of the more fruitful method of burning coke on the now well-known "sandwich system," in which a layer of coal is superimposed on the bed of coke. It should be noted, however, in passing that the complete practicability of burning gas coke alone on travelling-grate or chain-grate stokers with forced and chimney draught had been satisfactorily established.

The use of the sandwich system cleared the air of any trace of ignition difficulty, and minimised the loss of unburnt carbon in the ash. It introduced, however, the need for double chutes to each boiler hopper, with consequent capital expenditure. Thus the problem was brought to the commercial issue of an offer for coke at such a price as would cover the cost of breaking, bunkering, and any extra repairs and maintenance due to abrasion that might take place, and justifying any capital expenditure on further chutes. In the case under review this expense was estimated to be covered by an addition of from $7\frac{1}{2}$ to 10 per cent. to the then market price of coke. Orders were placed and resulted in definite economies.

It is satisfactory to record that the use of the sandwich system has introduced a new line of thought in fuel combustion, since not only coal and coke, but coals of varying thermal values and physical properties may be blended, to the advantage of both the commercial and national interests. By trial some advantageous mixture, having regard to market prices, stocks, and other factors, is soon determined, bringing into relief the elasticity of such a system when backed by a suitably divided bunker, chutes, and hoppers.

As a preliminary to gauging the position held by coke as a steam raiser relative to 2 or 3 of our well-known steam-raising coals, it is essential to ascertain as closely as possible the cost of evaporating 10,000 lb. of water by means of these various fuels burnt under the conditions obtaining in the factory. A normal set of conditions is here taken, being those usually present in a steam-driven power station, *viz.*, water-tube boiler, and chain- or travelling-grate stokers, with natural draught. The fuels selected are set out in Table I, with (*a*) their calorific value (*i.e.*, deductions being made for moisture weight and moisture evaporation), (*b*) their evaporative power from and at 212 deg. F, and (*c*) the "actual" year-in year-out boiler-house efficiency. The boiler-house efficiency here given is the ratio of the net calorific value of the fuel burnt, in thermal units, to the thermal units delivered to the water between hotwell temperature, and the resulting steam ready at the turbine stop valves. This efficiency is in many stations, it may be remarked, in close accord with the average "boiler and superheater" performance under test conditions.

Class of fuel.	Per lb. fuel calorific value. Typical analyses. Dry.	Net.	Boiler house efficiency. Fuel burnt on Sandwich System.	Evaporation per lb. of fuel from and at 212° F.	Evaporation per lb. fuel from water at 100° F. to steam at 200 lbs. pressure and 500° F. temperature.
				Lb. of water.	Lb. of water.
Scotch washed peas	12,480	10,060	72	7·46	6·03
Northumberland smalls ...	12,150	10,770	68·5	7·38	5·96
Coke	12,550	11,370	68	7·97	6·44
Coke breeze ...	11,030	9,320	67	6·44	5·20
Yorkshire washed smalls	13,620	11,540	72	8·57	6·92

These figures, having been carefully prepared and checked with due regard to all known factors, should now be set out in some convenient form for reference, as in fig. 2, for the more rapid determination of values with varying costs per ton of fuel delivered into boiler-house bunkers.

The point of intersection of any horizontal line with the curves of the various fuels will show equal evaporating value at varying costs per ton, depending on the fuel used. For instance, it will cost just as much (10s.) to evaporate 1,000 gals. of water by means of coke breeze bought at 11s. 3d. per ton as it will by means of washed slack bought at 15s. 6d. a ton. The point of intersection of any vertical line with the fuel curves gives a varying evaporative value with a given cost of fuel per ton, and it is seen that coke breeze at 10s. per ton will evaporate 1,000 gals. of water at a cost of 8.9s., whereas Yorkshire washed slack at the same price would do the same work at a cost of only 6.4s. The diagram reveals many points of interest. It is apparent on the basis assumed that with coal prices ranging between 11s. 6d. and 14s. a ton, it would pay to adopt breeze as a fuel if it were obtainable at slightly under 2s. a ton less than Scotch washed peas, and at slightly under 4s. 6d. per ton less than Yorkshire washed slack. With coal prices ranging as above, large coke should be obtainable at 2 or 3 pence less than Scotch washed peas, 3s. 6d. less than Yorkshire washed slack, and at about the same price or a little less than Northumberland slack.

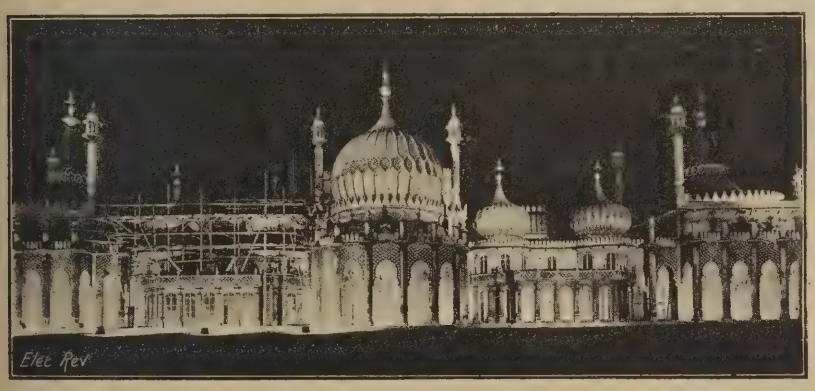
As will be noted also an advantage is gained by using *coke on the sandwich system* as against *coke alone* of about 1s. per ton with coal prices ranging as above, the figure in the case of coke breeze being 1s. 6d.

The saving to be expected by using a combination of *coal* and *coke* on the sandwich system may be gauged by taking an example. The grates we will assume are run on natural draught. An offer of coke delivered free is obtainable at 17s. 6d. a ton. This would evaporate 1,000 gallons of water at a cost of 13.4s. Northumberland smalls, let us say, are being burnt at 22s. a ton, giving a like cost of 16.7s. Assuming an evaporation of 500 gallons for each fuel, the cost will be $13.4/2 + 16.7/2 = 15.05$s. Compared with the figure of 16.7, this shows a saving of over 6 per cent. not obtainable without the use of this system. Even if forced draught stokers were available and coke could thereby be burnt alone, the saving would not be so great.

In conclusion, it may safely be stated that by a wise selection of fuel from a field thus extended by the introduction of another class in the form of coke and coke

breeze, and the expenditure of quite a reasonable sum for chutes, &c., many undertakings would derive benefit through lowered cost of power production, which in time would be passed on to the consumer. This would have a beneficial effect ultimately on other industries whose costs of production would thereby be lowered. Having established that such fuel can be burnt as a commercial success under large-capacity steam boilers by mechanical means, the economical utilisation of the nation's fuel resources is at once placed in a more favourable position than heretofore, as under a comprehensive scheme of fuel and power supply to a large community, bituminous coal could be carbonised at existing gas works situated in or near large industrial centres, the gas and valuable by-products recovered and distributed, and the residual coke burnt directly as fuel to produce electricity for power and lighting purposes either in near or more distant areas.

The Incorporated Municipal Electrical Association.



Annual Convention at Brighton.

(*Concluded from p. 75.*)

The Exhibition of Apparatus.

The exhibition of cooking and heating apparatus, which was held in the Corn Exchange, was the most complete and attractive that has yet been held in connection with the Convention; this feature is yearly increasing in value and importance, and we were pleased to see that the manufacturers had made full use of the excellent opportunity afforded them to bring their latest devices before the eyes of supply authorities and of the local public—in some cases new designs were shown which had not yet reached the stage of production in quantity.

The most picturesque display was undoubtedly a striking demonstration of up-to-date shop window lighting, arranged by the Electric Lamp Manufacturers' Association. A draper's window, dressed with dainty fabrics, flowers, and models, was illuminated from the sides and from the top by independent circuits with light of constantly changing colours, the possible combinations of tints being infinite in number and the gradual melting of one into another producing exquisite effects. A telling little pamphlet, showing how shop windows are lighted at present, and how they ought to be lighted, was specially prepared for the Convention, and should prove very fruitful in educating not only the public, but also electrical men, in this new and important art.

The Royal Pavilion Illuminated.

The lighting of the reception rooms of the Royal Pavilion, and the flood-lighting of its eastern front (here illustrated), were also efficiently organised by E.L.M.A.

Messrs. Bastian & Allen showed their water heaters, fitted with "Quartzalite" elements, and working on the thermal storage principle, maintaining a constant supply of water at scalding temperature. An outside terminal box is used, and the water connections have been improved so that no leakage under the wood lagging is possible. A "boosting" heater of the same wattage as the constant heater is provided, for use when extra demands for hot water occur. We understand that 300 of these geysers are installed in Wimbledon. Other interesting exhibits were the Rex "Little Wonder" grill-oven, taking 1,500 W, and capable of boiling, baking, grilling, or keeping food warm, the capacity being 15 by 9½ by 10 in. high; the Rex "Imperator" radiator, taking 1,000 W; and the Bastian furnace.

Messrs. Benham & Sons, Ltd., showed their "electro-vapour" radiators, in various types and sizes; a 10-kW boiler for tea and coffee, and smaller electric urns; a 3-kW geyser, and a variety of cooking apparatus.

Messrs. Belling & Co., Ltd., in addition to their well-known fires and cookers, and immersion heaters, had an entirely new feature on view—their No. 6 cooker, fitted with the "Honeycomb" boiling plate. This plate differs from any other in that it is built up of rectangular-section bars of fireclay, through each of which the nickel-chrome heating element is threaded. The bars are packed close together, and form a flat plate in direct contact with the cooking utensil; the spirals are of thicker wire than usual, and are protected by the fireclay bars from moving air, and from spilt liquids and solids, so that their life ought to be very long, whilst the sectional construction of the plate allows of free expansion and contraction. Moreover, it is impossible to short-circuit or get a shock from the wholly-enclosed spirals, and the plate can be scrubbed with impunity. A plate loaded at 2.5 kW is said to boil two pints of water from cold in six minutes, and a further two pints in three minutes.

Other improvements have been introduced in the new oven, which is fitted with top and bottom heat, the latter element doing all the general cooking, whilst the top heat speeds up the initial heating and gives the finishing touch. The top heater is also suitable for grilling. Each element is of 1 kW loading, with three heats, on separate switches. The corners of the oven are rounded, and the whole of the elements, grids, and runners can be completely removed for cleaning the inside. All the elements on the cooker are of the plug-in type, with standard "M K" spring sockets, entirely outside the heat zones. The switches are of the "Tok," English make.

The British Electric Transformer Co., Ltd., had two groups of exhibits: the "Sunray" radiators, and the "Tricity" cookers. The former were shown in a little suite of furnished rooms, the æsthetic qualities of the system being an important feature. The "Sunray" is a tubular glow-lamp of special design, housed in a copper reflector, in a variety of patterns, some of the radiators containing as many as five lamps, mounted in a horizontal position. Pedestal, wall-bracket, and four-legged types, as well as mahogany stands nearly six feet high, with silk surrounds, were shown. The loading is 200 W per lamp, and the effect of the warm glow is very pleasing, combining light and heat in a manner likened to that of sunshine.

On the company's stand were shown three types of "Tricity" cooker for hiring out, as well as a new small cooker for three persons; this consists of an oven of about one cubic foot capacity, with top and bottom heat, and two 7 by 6 in. rectangular boiling plates mounted close together, so that they can be used as one large plate. One of these plates has single-heat control, with a two-way switch which connects either the plate or the grill, but not both at once. The plates are of the protected open type, loaded to 1,200 watts, and the elements are interchangeable. Cookers for 6 and 10 persons and other appliances were also exhibited.

Carron Company had a good show of cookers, of various sizes and types, and a new wash-boiler in rustless cast iron; this was fitted with very substantial immersion heaters, and the whole made a very sound job.

On the stand of the Credenda Conduits Co., Ltd., in addition to the "Kaybee" and "Creda" electric boilers, fires, and various cookers, a special feature was the "Protector" kettle; this is fitted with a device which, in the event of the kettle being allowed to boil dry, cuts off the current before damage is done. The operation is effected by the melting of a small fuse, which releases a quick-break switch contained in the base of the kettle. A signal at a small window notifies the fact, and a new fuse can be inserted with ease. The device is quite new, and is being protected.

On the "Creda" cookers, plug-in elements are used; the boiling plates are open-topped, and may be provided with cast grids to deflect liquids, &c., from the spirals. The fuses are

enclosed, and the whole of the oven interior is removable. A notable feature of the oven is the facility with which either top and bottom or side heating can be provided, the bus bars being ready drilled for the elements to be attached.

The General Electric Co., Ltd., showed a number of "Magnet" electric cookers, of various sizes, some of which were specially designed for hiring-out. A new hob has been adopted, giving ample space for warming dishes. Other exhibits included a wash boiler, "Magnet" kettles, a variety of small domestic appliances, fires, &c.

Messrs. L. G. Hawkins & Co., Ltd., had a varied exhibit of their "Universal" appliances, including a new electric cooker of polished aluminium, of what we may call the "Prentice" type, and cookers of the range pattern with removable elements and removable interior. A new type of heating element was shown. Besides electric irons and an electric trouser press, there was an electric ironing machine for table use, taking 1,500 W; this was a very handy machine. A "Vio Ray" high-frequency outfit was also exhibited.

The Hotpoint Electric Appliance Co., Ltd., had a comprehensive exhibit of "Hotpoint-Falco" cookers, in which a number of recent improvements were incorporated. The "Standard" model, No. 5,280, designed for the modern electric home, has open boiling plates mounted in a hinged hob; A neat table model was shown, with the same loadings. Hundreds of these cookers have been supplied to the Liverpool Corporation for its 1,000-house scheme, as well as 2-kW immersion heaters which are fixed in the hot-water tanks. Glasgow Corporation is installing the No. 5,280 cooker and the 4-kW wash boiler in a similar 1,000-house scheme.

The Jackson Electric Stove Co., Ltd., showed a number of their cookers, fitted with standard boiling plates over which are grids of an alloy which, it is claimed, neither buckles nor scales. A large hot-cupboard space is provided, and liquids falling through the plates are caught on a reflector plate so that they do not fall into the hot-cupboard. At half heat, the hot portion of the boiling plate is concentrated so as to be suitable for heating a small pan. The Jackson wash boiler was also shown. We were informed that 3,000 cookers had been supplied to five supply undertakings.

On the stand of Metro-Vick Supplies, Ltd., two of the new "Cosmos" cookers were shown. These are fitted with totally-enclosed (B. & K.) or semi-enclosed boiling plates, which are interchangeable with ease, and have the feature that one coil is concentrated in the middle. The semi-enclosed plate has two spiral coils lying in grooves in a glazed porcelain block, slotted to allow liquids to fall through, with a protecting grid of a special metal covering the spirals. The oven is heated at top and bottom with coils on small porcelain bobbins attached to a metal reflector plate, and the grill element is of similar construction. A hinged top plate gives access to the wiring. A large hot cupboard, with a door is provided.

A new pattern of 2-kW Cosmos fire, with two bars, was shown; the spirals are arranged longitudinally, in parabolic grooves, and are not in continuous contact with the porcelain bars, so that they glow directly they are switched on. Other exhibits were the Cosmos Home iron, a table grill and toaster, and a 3¼-pint copper kettle in the construction of which a special hard solder is used which does not melt like soft solder directly the kettle boils dry, the Cadillac vacuum cleaner, a washing machine, &c.

Messrs. George Nobbs, Ltd., showed their "Genii" copper wash boilers, with immersion heaters, the "Vectis" water heater for continuous heating at light load (250 W, with a 1,500-W booster), a 10-gallon urn in nickel alloy, and their towel rails and hot-water radiators. The portable "Vectis" heater, of ¾-gallon capacity, can be run off a lighting circuit, and supplies 5 gallons of hot water per day. Geysers of 9-kW loading, and the "Genii National" calorifier, which is used for a closed system under pressure, and can be automatically controlled, were other features of the exhibit.

A series of "Xcel" cookers was shown by the Siemens and English Electric Lamp Co., Ltd. The cooker is an entirely new pattern, with plug-in boiling ring and grill elements, and easily replaceable oven elements; the grill serves also as a hot-plate and boiling ring. The heating element of the boiling rings is of a new design, consisting of a circular earthenware plate with holes through which the spiral is threaded; pans can stand on the plate itself, or if preferred a solid top can be used. The "Xcel" irons carry a perpetual guarantee.

Messrs. McClary, a Canadian firm, had an interesting exhibit of cookers as used for many years in Canada; these are fitted with "Tor-red" heating elements, in which the spiral is embedded directly in an earthenware plate which will stand running at red heat, the utensils being placed on the plate itself. A cylindrical oven is a popular Canadian type, with top and bottom heat, and dial temperature indicators are fixed in the oven doors. The table pattern has four boiling plates; the elements are of the plug-in type, and the oven interior is seamless, with rounded corners.

An interesting exhibit was an improved pattern of the "Tungar" rectifier of the British Thomson-Houston Co., Ltd. This is now of entirely British make, and we understand that the demand exceeds the supply; it has been adapted to charge high-pressure as well as low-pressure batteries for radio-telephony, giving 2 A at 7.5 V, 1 A at 15 V, 0.1 A at 75 V, and 0.06 A at 100 V. A mistake-proof plug is provided for the change-over.

Several demonstrations were also given in the town. At the "Electric Shop" of Messrs. Galliers, Ltd., North Street, the windows were dressed with G.E.C. "Magnet" irons, "Freezor" fans, washing machines, &c., and the "Gecoray" system of shop-window lighting was installed. Messrs. Hanningtons, Ltd., had an excellent shop-window lighting scheme in use near the Royal Pavilion, and Messrs. Page & Miles, Ltd., also used the "Gecoray" reflectors to advantage. The Hurley Machine Co. had a large exhibit of "Thor" electric washers and wringers, the "Thor" automatic ironing machine and vacuum cleaner, and a small ironing machine, which occupied a space of only 22 by 26 in. when turned up.

A feature of the exhibition was the "Magicoal" fire of Messrs. Berry's Electric, Ltd., of which two admirable examples were shown in operation, looking extremely realistic. Mr. H. H. Berry also welcomed visitors at his electric flat in King's Gardens, Hove, of which we gave a description in our issue of June 12th, p. 943; we found the equipment of the flat even more remarkable than was there indicated, and carefully planned so as to reduce the labour of housekeeping to the minimum.

A Visit to the Electric Farm.

DURING the Convention week an open invitation was extended by Mr. R. Borlase Matthews to all interested to view the farm near East Grinstead, where he puts into practice his well-known theories on the uses of electricity in agriculture. The visitors numbered nearly forty, among whom were included Dr. and Mrs. Ferranti. They were taken through the light and airy cowsheds, where they saw the certified herd and noted the equipment of electrical milking machines. Next, passing to the dairy, they were shown the bottle-sealing and washing machines and the butter-making machines, the power for all of which was electrical. They were particularly interested in the hay-curing equipment, by means of which it is possible to transform green grass into properly-cured hay without the aid of the sun. This has been proved to be very acceptable to cattle, at a lower cost per acre than ordinary hay—thus the farmer can both economise and dodge the "clerk of the weather."

In the poultry-houses the keenest attention was given to the mammoth incubator, capable of hatching 2,400 chicks at once, the success of which lies chiefly in the fact that the warmed air is distributed mechanically by means of electric fans; 3,400 little chicks were cheeping in the brooder or foster-mother house. In the poultry-houses themselves, by means of electric light, the hens are persuaded into thinking that the sun has not set, and thus under the rays of artificial sunlight they continue feeding (instead of having to starve through a long night). As a result, they reward their owner by laying 20 per cent. more eggs in the winter, when their efforts are most lucrative.

An electro-culture high-pressure apparatus for discharge over crops was also viewed, and an electric thrashing machine, an electric plough, and an electric clipping and shearing machine—in all, some 67 different applications of electricity.

In the repair shop of the farm the visitors examined a wireless set specially designed for the use of the farmer, the simplicity of which renders it capable of unskilled manipulation over a very wide range of conditions.

Special Libraries and Information Bureaux.—Following a highly successful conference held at Hoddesdon last year of those interested in special libraries and agencies for the collection, treatment and distribution of information, a representative standing committee was appointed to ensure continuity of the work, and to arrange for a second conference. This committee has been fortunate in obtaining assistance from the Carnegie United Kingdom Trustees, and the proceedings of the first conference have just been issued. The committee has decided to name the body thus called into being "The Association of Special Libraries and Information Bureaux."

The second conference of the Association will be held at Balliol College, Oxford, during the week-end, September 25th to 28th, 1925; full particulars can be obtained from the organising secretary at the offices of the Association, 38, Bloomsbury Square, London, W.C.1.

One of the main functions of A.S.L.I.B. will be to furnish a master-key to our storehouses of knowledge, whether libraries or otherwise. To this end it will aim at co-ordinating in the general interest, the various specialised libraries now in existence, promoting the formation of new libraries where this seems to be necessary; and, as a principle, effecting and aiding liaison between centres of information whatever their scope. It should, however, be noted that A.S.L.I.B. has no intention of building up a vast centralised institution forming a physical location for information, but an expert organisation designed to give the *bona fide* inquirer quick and accurate guidance as to the best and most reliable sources of information available. It will not directly furnish specific information (which would necessitate an enormous staff), but will function rather as a clearing house for sources of information, and as a medium of inter-communication for those engaged in the development and use of informational sources.

New Technical College at Middlesbrough.—The Middlesbrough Corporation has decided on a site for a new technical college, to be erected through the munificence of the Constantine family of shipowners at a cost of £80,000, close to the railway station. The design for the building is by Mr. Graham R. Dawbarn.

Business Notes.

Commercial and Industrial Developments, Business Changes, Trade Opportunities, New Publicity Literature, Liquidations and Failures.

The "Electrical Review" Index. — The Index for the last half-yearly volume of the ELECTRICAL REVIEW (January to June, 1925), is now being printed. Copies will be forwarded post free to those requiring them for binding or for reference purposes, if they will make application to the Publisher, ELECTRICAL REVIEW, 4, Ludgate Hill, E.C.4.

The Electricity Supply Commercial Association. — Mr. G. R. Smith, the general secretary of this Association, writes as follows:—"Quite recently an advertisement appeared in your columns inviting commercial and clerical workers who have had any experience of municipal or company electricity undertaking work to send particulars of their qualifications and experience for enrolment in the Association's Unemployment Register. I may say that the response has been very good and is a tribute to the advertising power of your publication. At the same time I should like to point out that a large number of the applicants possessed engineering qualifications only. Also several correspondents are under the impression that the advertisement also applied to the manufacturing industry. To those who have had clerical experience in the manufacturing industry, of course, employment on costing and accountancy would be very similar, but I should like to have received more replies from those who have been, or are, actually engaged in a municipal or company electricity supply undertaking. May I take this opportunity of thanking all those who responded to the advertisement and to assure them that not only will their names be recorded in the Association's Register, but that in the event of the Association being in a position to notify them of a post, they will receive full particulars as the occasion may arise? Will they also note that my address is now 'Beaulieu,' Bean Road, Bexleyheath?"

Bankruptcy Proceedings.—D. D. RAYNER, 6, Wilson Street, Derby, engineer.—With reference to the report of this public examination published in our issue of July 3rd (p. 12), Mr. Rayner informs us that the first business, *i.e.*, Rayner and Heald, Ltd., was not, as reported, started by him on "borrowed" money, but with money put up by Mr. Platts, who eventually became chairman of the company. From a number of newspaper reports that have been placed before us it appears that in 1919, shortly after the commencement of the company, Mr. Rayner borrowed from Mr. Platts £300 to enable him to acquire a house in Derby for his residence and a promissory note was given for that amount, it being arranged that debtor's share of commission on the profits of the business should be applied toward the liquidation of this debt. Judgment was given against debtor on the promissory note in respect of the £300 borrowed for the purchase of the house, and £200 costs had to be paid. At the public examination debtor said that an action by him against Rayner & Heald, Ltd., was pending. He filed his petition when execution was levied following the Leeds judgment.

S. C. RAPSON, C. L. BURRILL, and A. J. HEFFER (trading as the Suburban Electrical & Maintenance Company), electricians 2, Plough Yard, Shoreditch, E.—A joint statement of the debtors' affairs has now been filed, and it discloses ranking liabilities of £2,813 and established net assets of £677. The following are the chief creditors:—

	£		£
Berry's Electric, Ltd. ...	22	Metallic Seamless Tube Co., Ltd.	423
Day, Mrs. C. H.	109	Rapson, Miss E. L. ...	187
E.E.E. Carbon Co., Ltd.	24	Rapson, Miss E. M. ...	669
Falk, Stadelmann & Co., Ltd.	26	Rapson, E. J.	110
General Electric Co., Ltd.	437	Record, Oswald	34
Hackbridge Cable Co., Ltd.	40	Walsall Hardware Co., Ltd.	488
Leach, S. G., & Co., Ltd.	148	Bird, J.	20

C. B. MAURICE, cable supplier and importer of electrical goods, late of Windsor House, Victoria Street, Westminster, S.W.—The first meeting of creditors in this case was held on July 7th at the London Bankruptcy Court, when accounts were submitted showing liabilities of £745, against assets of 7s. 2d. The receiving order was made on the petition of the C. A. T. Cable Co., Ltd., creditors for £85. It appeared that in 1919 the debtor became director of a limited company carrying on business as merchants. Some five years later he began business on his own account in the same line with a capital of between £100 and £200. He imported electrical goods from Germany, and the business proved a success for six months, but he afterwards experienced difficulty in obtaining delivery of goods, with the result that he lost markets. He lost £500 on horse racing. He attributed his failure to lack of capital, loss of trade, to loss incurred as a bookmaker, and to a judgment given against him in an action brought by the petitioning creditors, and also his counterclaim against them. The estate was left in the hands of the Official Receiver.

S. T. HOSKEN, wireless accessories manufacturer and factor, 153, Fleet Street, E.C.4.—The public examination of this debtor was held on July 10th at the London Bankruptcy Court, the accounts showing liabilities of £953, against net assets valued at £33, after deducting £70 for the payment of preferential claims. Replying to the Official Receiver, debtor said he served with the Royal Air Force during the war, and from April, 1919, to March, 1923, he was in employment. In the latter month he commenced business at 19, Eagle Street, removing in the following November to Fleet Street, where he traded until the receiving order was made against him last May. He attributed his insolvency to bad trade and other causes. The examination was concluded.

A. JONES, electrical engineer, 2, Robert Street, Ynysybwl, Glamorgan.—Trustee, Mr. E. Owen, Official Receiver, 34, Park Place, Cardiff, released June 24th.

D. E. JONES (D. E. Jones & Co.), electrical contractor, 29, Carne Street, Pentre, Glam.—Trustee, Mr. E. Owen, Official Receiver, 34 Park Place, Cardiff, released June 23rd.

W. K. M. WILSON, electrician and wireless apparatus dealer, 1, Mount Street, Heanor, Derby.—Receiving order made July 3rd on debtor's own petition.

F. W. CASELEY (The Radiograph Co.), wireless engineer, 5, Hepworth Arcade, Kingston-upon-Hull.—First meeting, July 15th at the Official Receiver's office, 37, Scale Lane, Hull. Public examination, July 20th, at the Guildhall, Hull.

J. HUMPHREYS, plumber and electrical engineer, the yard behind the Plough Inn, Oldham Road, Rochdale.—First meeting, July 14th at the Official Receiver's offices, Byrom Street, Manchester. Public examination, July 24th, at the County Police Court, Rochdale.

R. S. MAGSON & Co., electrical engineer 10, Stoney Stanton Road, Coventry.—Trustee, Mr. C. J. Band, Official Receiver, 9-11, High Street, Coventry, released June 12th.

A. T. WILLIAMS and W. J. BEVAN (Electrical and General Engineering Co.), electrical engineers, 49, Commercial Street, Aberdare.—Trustee, Mr. E. Owen, Official Receiver, 34, Park Place, Cardiff, released June 25th, 1925.

S. L. BAPTY and N. MILES (The Wireless Instrument Manufacturing Co.), wireless instrument manufacturers, Avenue Works, Avenue Road, Willesden, N.W.—Second and final dividend of 2s. 10d. in the £, payable at Messrs. Poppleton, Appleby and Hawkins, 4, Charterhouse Square, E.C.1.

A. H. DUFFIN and G. KERSHAW (A. H. Duffin & Co.), electrical engineers and contractors, Provincial Buildings, Conway Road, Colwyn Bay.—Second and final dividend of 2s. 10d. in the £, payable July 29th at Mostyn Chambers, Colwyn Bay.

J. S. YEOMANS, 11, Hill View Terrace, Chapel Allerton, Leeds.—Receiving order made July 8th on debtor's own petition.

Private Arrangements.—CAPT. W. L. GRAY, 9, Victoria Parade, Muswell Hill, N., wireless and electrical dealer.—A meeting of the principal creditors in this matter was held on July 6th at the offices of the Marconiphone Co., Ltd., when the chair was occupied by the representative of that company, which was the largest trade creditor. A statement of affairs was presented which showed liabilities of £2,485, of which £2,455 was due to unsecured creditors, and there was a bank overdraft of £30. The assets were estimated to realise £2,950, or a surplus of assets over liabilities, subject to realisation, of £465. It was reported that the debtor came to England in 1922 after serving in the war, and commenced the present business in the December of that year. He had a gratuity of £750 and investments worth £550. Those investments had been realised some time ago at a slight loss. His wife also had £200 and the whole of the moneys were put into the business. After the first fifteen months' trading the debtor made a little under £700 profit from the business which, after drawing about £400 for his personal expenses, left a net profit of £300. The debtor then decided to go into the wholesale business; and that also was quite profitable. Owing to certain conditions of the National Association of Radio Manufacturers the debtor was undersold by at least 10 per cent. in different parts of the country and consequently lost a considerable amount of trade. The chief cause of the present position, however, was that a sum of £800 was owing from a certain gentleman who had promised to pay £200 in the course of a few days and to repay the balance by instalments. If the debtor continued in business he proposed to do away with the wholesale side altogether. On behalf of the debtor a solicitor made an offer of 10s. in the £, payable as to 3s. 4d. in November, 1925, 3s. 4d. in January, 1926, and 3s. 4d. in May, 1926. The largest creditors resolved to advise the acceptance of the offer. A committee of creditors was appointed, and it was agreed that the committee should be vested with the power to advise the debtor to do whatever it thought right. The following are creditors:—

	£		£
British Thomson-Houston Co., Ltd.	85	Igranic Electric Co., Ltd. ...	155
Brown, S. G., Ltd.	183	Marconiphone Co., Ltd.	415
Burndept, Ltd.	182	Metropolitan - Vickers Electrical Co., Ltd.	21
Chloride Electrical Storage Co., Ltd.	255	Non Aeril Manufacturing Co. ...	28
Dubilier Condenser Co., Ltd. ...	107	Radio Communication Co., Ltd.	36
Edison Swan Electric Co., Ltd.	52	Robinson, L., & Co.	134
Ever-Ready Co., Ltd.	126	Sterling Telephone Co., Ltd. ...	85
Fuller's United Electrical Works, Ltd.	29	Silverex, Ltd.	21
General Electric Co., Ltd. ...	116	Troupe, Curtis & Co.	47
Graham & Co.	91	Watmel Wireless Co., Ltd. ...	22
Greenslade & Brown	23	Watshams, Ltd.	73
		Thomas & Co.	20

Thomas Barton, electrical and radio engineer, Electric Works, Ainsworth Street, Blackburn.—The creditors interested herein were called together on July 7th, at Manchester, when a statement of affairs was submitted which showed ranking liabilities of £3,686, all due to unsecured creditors. In addition, there were first and second mortgages on the works to the extent of £3,200. The works were valued at £5,000, leaving a surplus of £1,800. The bank was shown as a creditor for £1,744 in respect of an overdraft, but as security it held a dwelling house of the value of £1,100, and two policies on the life of the debtor of the surrender value of £546, and for the purposes of the statement the bank was treated as being fully secured. The assets were estimated to realise £4,007, from which had to be deducted £50 for preferential claims, leaving net assets of £3,957, or a surplus of £270. Mr. Howarth, solicitor, who occupied the chair, reported that a deed of assignment was executed by the debtor on June 29th to Mr. G. Waterworth, C.A., of Blackburn. The chairman added that the debtor was aged 72, and was probably one of the oldest, as well as the most respected electrical engineers in Lancashire. There was a prospective purchaser for the works. The stock-in-trade was a somewhat difficult one to dispose of, but it was believed that it would realise £1,500. The creditors passed a resolution confirming the deed of assignment already executed to Mr. Waterworth, whilst a committee was also appointed consisting of the representatives of the Greengate & Irwell Rubber Co., Ltd., the General Electric Co., Ltd., and Cryselco, Ltd. The following are creditors:—

	£		£
Anderson, W. A.	137	Kirk & Co.	37
Barton, Miss E.	390	Lancashire Dynamo Co.	94
Beardsell & Co.	54	Lupton, H. E.	59
British Insulated & Helsby Cables, Ltd.	60	Metro-Vick Supplies, Ltd.	53
Beaton Metal Co.	28	Northern District Co.	44
Baxendale & Co.	23	Oldham & Son	36
Carter & Sons	34	Pope, E.	48
Cryselco, Ltd.	120	Regent Trust, Ltd.	110
Crabtree & Co.	47	Smith, F	30
Condor Lamps	21	Siemens Bros. & Co., Ltd.	69
Electrical Apparatus Co.	35	Standard Press	26
Eldridge & Morris	122	Smith & Ansell	22
Falk, Stadelmann & Co.	44	Sun Electrical Co., Ltd.	24
Graham & Co.	23	Samuel & Freedman	180
Greengate & Irwell Rubber Co.	109	James, S. & F. S.	200
General Electric Co., Ltd.	101	Toulmin & Co.	20
Gaskell, T.	58	Wandsworth Electric Co.	29
Harris Electric Co.	132	Waddie & Co.	43
Higginson Bros.	44	Whittle & Son	47

Company Liquidations.—Marine and Mechanical Electric Welding Co., Ltd.—Particulars of claims to the liquidator, Mr. L. C. F. Robson, 146, Bishopsgate, E.C.2, by August 15th.

H. Joseph & Co., Ltd.—Winding up voluntarily. Liquidator, Mr. N. Bell, 26-27, Bush Lane, E.C.; meeting of creditors, July 21st, at the Institute of Chartered Accountants, Moorgate Place, E.C. Particulars of claims to the liquidator by August 9th.

Gas and Electric Securities, Ltd.—A petition for the winding up of the above-named company has been presented to the High Court by the Northern Exploration Co., Ltd., of 62, London Wall, E.C., and will be heard in London on July 21st.

Dissolutions of Partnership.—Coleman & Warren, wholesale electrical suppliers, 66, Victoria Street, S.W.—Mr. H. E. Clerk and Mr. W. J. Warren have dissolved partnership.

Gilfillan Bros., radio manufacturers and dealers in radio apparatus, 63, High Holborn, W.C.1.—Mr. K. Gilfillan and Mr. H. W. Cook have dissolved partnership. Debts will be attended to by Mr. Cook, who will continue the business under the same style.

Oram & Lakin, The Showman's Stores, and The Scenic Electrical Co., dealers in showman's accessories, 67, Besley Street, Streatham, S.W.—Messrs. A. Oram and R. J. Lakin have dissolved partnership. Mr. Lakin will attend to debts and continue the business.

Main & Woodward, electrical engineers and contractors, 11, High Street, Barnet, and 11, Abingdon Road, Finchley.—Mr. A. W. Main and Mr. C. L. Woodward have dissolved partnership. Debts will be attended to by Messrs. Boyes & Son, solicitors, Barnet. Each partner will in future trade independently in his own name.

Local Exhibition.—Holmfirth.—As a prelude to the institution of a scheme for the hiring of domestic electrical appliances, the Urban District Council recently organised an electrical exhibition in the Council Chamber. The Jackson Electric Stove Co., Ltd., provided demonstrators for the cooking and other appliances which are being supplied by the company to the Council for its scheme. Alderman Mrs. Hammer (Hackney), chairman of the Electrical Association for Women, attended the opening ceremony and gave an address on the advantages of electricity in the home. The engineer and manager of the undertaking (Mr. J. W. Fawcett) informs us that one result of the exhibition was the placing of a number of definite orders for appliances, including 18 cookers.

Social Events.—The staff of the Willesden Council Electricity Department held its annual outing at Southend-on-Sea on July 4th. There was a record attendance and the party was accompanied by the chief of the Department, Mr. A. W. Blake.

On June 27th the staff of the Dagenite Works of Messrs. Pritchett & Gold and E.P.S. Co., Ltd., with which is incorporated the business of Peto & Radford, spent a very enjoyable day at Brighton. A party of between four and five hundred attended a lunch at the Corn Exchange. Short speeches were made by Sir Archibald Gold, and Messrs. Peto and Roberson.

On July 4th, the employés of the Wallasey Electricity Department held their annual picnic. The outing took the form of a drive through Mold and Loggerheads to Cerrig-y-Druiden, where luncheon was served. The party, numbering about 150, then proceeded, *via* the bank of the River Conway, to Colwyn Bay, where tea was taken, the return journey being made *via* Abergele, St. Asaph, Holywell, and Queensferry. The party included Councillor Hughes, chairman of the Electricity Committee, Mr. B. T. Hawkins, the borough electrical engineer, and his deputy, Mr. E. Cook.

The annual outing of the employés of Messrs. Cunningham, Ltd., Edgware Road, was held on July 12th, when the party went by charabanc to Abingdon.

A Submarine Cable Film.—On July 8th, a large gathering of Press representatives witnessed a film produced under the auspices of the Federation of British Industries with the co-operation of the Eastern Associated Telegraph Companies. The film is designed to impart a knowledge of the nature of cable communication and is divided into three parts. The first section shows the manufacture of a submarine cable in the factory of the Telegraph Construction & Maintenance Co., Ltd. The laying on of the gutta-percha, brass tape, jute, and iron armouring, are shown stage by stage and their functions are explained. The second part deals with the laying and repair of a submarine cable. The officers of a cable-repairing ship are pictured taking the necessary bearings to locate the cable and the repair of a break is carried out. The final section depicts the activities of the staff at Electra House, Moorgate, E.C., the headquarters of the companies. There the organisation for dealing with messages is shown operating at full speed. The film is likely to have a wide popular appeal but more could have been done if it were not for the fact that it is destined to form but a small part of a kinema programme, and is thus confined to a certain length.

Cricket Match.—The Birmingham Electrical Contractors' Association recently challenged the outside representatives of the Birmingham branch of the General Electric Co., Ltd., to a cricket match. The match was played on the ground of the Magnet Club, Witton Works, Mr. A. Berkeley acting as umpire for the contractors. The G.E.C. team compiled a score of 97, and the contractors had amassed 113 for the loss of five wickets when the game was brought to an end by failing light. A social evening at the Magnet Club followed the match.

The Position of the Iron and Steel Industry.—Speaking at Dudley recently, the Home Secretary (Sir Wm. Joynson-Hicks) made mention of the fact that whereas before the war this country imported only a seventh of its wrought-iron requirements, now a third of the requirements was obtained from abroad. He also referred to the position of other branches of the iron and steel industry, and said that if we were to continue to import foreign products made under worse conditions than obtained in this country, we could not expect to be able to compete. Apart from the imposition of import duties, there were only two ways of saving the situation—by inducing French and Belgian trade unions to insist on better wages or conditions, or by the reduction of wages in this country to the level of those of our competitors, which was not desirable.

Trade Announcements.—Messrs. Philips Lamps, Ltd., have opened a branch office at 21, Stoney Street, Nottingham, with Mr. Howard V. Crisp as manager.

Messrs. W. E. Burnand & Co. have completed the removal to the Duo Works, 66-106, Shoreham Street, Sheffield. The new works are more centrally situated than the old, and four times the area is available.

Messrs. James Scott & Co., electrical and radio engineers, have opened new showrooms at Queen Anne Street, Dunfermline, and are showing a selection of the latest electrical fittings, shades, radiators, &c.

The telephone numbers of the Birmingham (Moor Street) branch of the General Electric Co., Ltd., have been altered to "Central 7944/51" (eight lines).

Messrs. George Green & Co. have removed from George Street to larger premises at 40, Aybrook Street, Manchester Square, London, W.1.

Messrs. Creed & Co., Ltd., inform us that they have purchased Mr. Donald Murray's telegraph business, including the Murray telegraph patents, and they will in future manufacture and supply the Murray Multiplex and other Murray apparatus. Mr. Murray will for a time give them the benefit of his valuable experience in the telegraph field.

The Budleigh Salterton Electric Light & Power Co., Ltd., has opened a showroom and office at Fore Street, Budleigh Salterton, and is desirous of receiving catalogues of wiring materials, fittings, and accessories.

The business of Mr. S. Levett, of Gravesend, has been reformed under the style of the Gravesend Welding and Electrical Engineering Works, and new premises have been taken in Crete Hall Road.

Engineering Developments, Ltd., has removed from Victoria Street to 13, Page Street, Grosvenor Road, S.W.1.

The Monomarking of Goods.—British Monomarks, Ltd., is the name of a company which has been formed, with offices at 19, Abingdon Street, London, S.W.1, to secure the wide-

spread adoption of Monomarks—an idea that originated with and has been developed by Mr. William Morris and which has the approval of a large number of well-known business men, including representatives of big associations. It is believed that by the adoption of a Monomark—a symbol of four characters—which will be duly registered at Monomark House (to cover two acres in London), manufacturers, traders, and private individuals will be able to have an exclusive mark of their own with which to mark their products, their private belongings—if they will, even themselves. We have not space to elaborate the possible applications of the idea, for the more one thinks of them the more numerous they become, but we may indicate one for the information of business people. A firm of British manufacturers making switches or other electrical articles supplies them to a factor, an exporter, or an overseas agent. They may find their way into the hands of somebody in some remote corner of the globe who knows nobody who can replace them or sell further articles of the kind. The article, however, bears the registered Monomark of the maker, say B.M./K.N.4S., and the customer sends a letter addressed to that mark, c/o London. By arrangement it will be delivered by the Post Office authorities here to Monomark House, where the name and address will be recorded and the letter forwarded to the right place, thus placing the user in direct touch with the maker or the supplier, whichever has adopted the said mark. It is considered that such a system, if widely adopted, for a registration fee of 5s. per annum, will materially facilitate the flow of trade. Readers frequently ask us for the name of the maker of goods bearing a certain trade mark. Our task in this connection would be greatly simplified if there were some universal system of Monomarking. Those who are interested in the matter—and it unquestionably is very interesting and seems to have great possibilities if it is taken up on a sufficiently large scale—should apply to Mr. Morris at the above address for the literature that is available.

Catalogues and Lists.—THE BENJAMIN ELECTRIC, LTD., Brantwood Works, Tariff Road, Tottenham, N.17.—"The Benjamin Reflector," containing illustrations and notes on lighting service, &c.

ELECTRICITY SERVICES, LTD., 27, Martin Lane, Cannon Street, E.C.4.—An illustrated folder dealing with efficient shop-window lighting.

THE EFFICIENCY LAMP SHADE CO., 3 Took's Court, Furnival Street, Holborn Circus E.C.4.—Two illustrated pamphlets advertising the firm's lamp shades with removable glass panels.

THE BRUSH ELECTRICAL ENGINEERING CO., LTD., Falcon Works, Loughborough.—Catalogue 608, illustrating and describing in detail the company's salient pole alternators for engine or water-wheel drive.

THE D.P. BATTERY CO., LTD., Bakewell, Derbyshire.—An illustrated pamphlet dealing with "Kathanode" batteries for electric battery locomotives.

THE CHLORIDE ELECTRICAL STORAGE CO., LTD., Clifton Junction, near Manchester.—An illustrated pamphlet describing the battery installation at a country house.

MR. HARRY MOSS, 82, Leeds Road, Bradford.—An illustrated pamphlet dealing with shop window lighting and a postcard advertising the "Whitecap" electric washing machine.

THE IRON & NICKEL BATTERY CO., LTD., 301, Abbey House, Victoria Street, S.W.1.—A leaflet illustrating the "Ionic" nickel-iron accumulator for omnibus lighting.

Book Notices.—"Scientific Papers of the U.S.A. Bureau of Standards."—No. 504, "A Method of Studying Electrode Potentials and Polarization" (15 cents). No. 505, "Critical Potentials Associated with Excitation of Alkali Spark Spectra" (10 cents).

"Publications of the Massachusetts Institute of Technology."—Contribution from the Electrical Engineering Research Division, Serial No. 44, October, 1924 "Regulator Settings for Long Lines—Automatic Voltage Regulator can be used to arrive at desired operating characteristics.—Theory of Performance, Example of Application, and Analysis of Requirements."

"Combustion and Atmosphere and Their Relation to Disease," by Dr. W. Vernon Sinclair. Pp. 47. London: J. Bale, Sons & Danielsson, Ltd. Price, 2s. net.

"Costruzioni Elettromeccaniche," Vol. II, Sec. 2.—"Transformatori-Motori-Commutatrici Gruppi Varii" by E. Morelli. Turin: Unione Tipografico-editrice Torinese. Price 100 lire.

"Transactions of the Institution of Engineers, Australia." Vol. III, 1922.—Sydney, N.S.W.: The Institution.

"Phases of Modern Science," published in connection with the Science Exhibit arranged by a committee of the Royal Society in the Pavilion of H.M. Government at the British Empire Exhibition, 1925. London: A. & F. Denny, Ltd. Price 3s. 6d.

"The British Engine, Boiler and Electrical Insurance Co. Technical Report for 1924." xxxvii + 161; figs. 127.—Contains many interesting illustrations of defective plant, &c. Published by the Company. Price 7s. 6d. net.

"Approved Wireless Service."—We are informed that the Radio Association, of Sentinel House, Southampton Row, W.C., is issuing a sign to approved wireless dealers able to satisfy the Association's Technical Committee of their standing. It is intended that the sign shall be a guarantee to the public that the firm displaying it can render an authenticated technical service. The sign is an enamelled reproduction of the Association badge.

Australian Municipal Electrical Engineers' Salaries.—The Municipal Officers' Association of Australia has prepared and circulated a new list of salaries, to apply to its members throughout Australia. The salaries claimed for electrical engineers of municipal supply undertakings are as follows:—Supervising electrical engineer, £900; electrical engineer £750; assistant electrical engineer, £600. Under the present award the salaries of these officials vary according to the revenue of the supply undertaking to which they are attached. With revenue varying between £1,500 and £50,000 per annum, the award for a supervising electrical engineer-in-charge varies from £364 to £676; with revenue varying between £1,500 and £30,000, the salaries of an electrical engineer-in-charge and of an assistant electrical engineer respectively vary from £312 to £468 and from £250 to £360. When the list comes up for discussion a sliding scale, somewhat on the lines of the one at present in force, will doubtless be adopted.—*Electrical Engineer of Australia and New Zealand.*

Proposed New Electricity Offices and Showrooms.—The Cardiff Electricity Committee has decided to make an offer of £12,500 for the purchase of premises in Castle Street for the purpose of offices and showrooms for the department.

British Trade Mark Applications. — The following are among the recent applications for British Trade marks. Objections against any of the proposed marks may be lodged within one month from July 8th. In the case of foreign applications, the names and addresses of the British representatives are also given:—

Harmonola. No. 458,687. Class 8. Philosophical and scientific instruments and apparatus for useful purposes.—E. A. Graham, trading as Alfred Graham and Co.

C. & E. S. (lettering and design). No. 457,596. All goods in Class 8, but not including electric accumulators or goods of a like kind.—A. B. W. Bergl, trading as the Cable and Electrical Supplies, 234, Pentonville Road, N.1.

Governor. No. 449,313. Class 18. Electric fires, electric hot plates, &c.—John Shaw & Sons (Wolverhampton), Ltd.

Design only. No. 457,868. Class 8. Electric cables.—Naamlooze Venootschap Hackethal Kabel en Thermophoon Maatschappij, 25, Javastraat, The Hague, Holland (A. A. Thornton, Quality Court, Chancery Lane, W.C.2).

Octopus (lettering and design). No. 458,314. Class 8. Fixed electrical condensers, not being parts of machines.—B. Haine, trading as Radio Stocks (B. Haine), 89, Newman Street, W.1.

Magnaton Aerial Encircles The World (lettering and design). No. 458,557. Class 8.—Aerials Sparklets, Ltd., Angel Road, Upper Edmonton, N.18.

Sunray. No. 458,889. Class 8. Bright and dull emitter valves for radio-telephony.—D. Newton, 9, North Park Road, Roundhay, Leeds.

Tanic (lettering and design). No. 459,184. Class 13. Electric relay cables.—La Société Télémécanique, 5, Rue St. Remy, Liége, Belgium (Feeny and Feeny, 73a, Queen Victoria Street, E.C.4).

Our Foreign Trade.—JUNE FIGURES.—The following were the values of imports and exports of electrical goods and machinery during June, 1925:—

	June, 1925. £	Inc. or dec. £	6 months 1925.
Imports.—			
Electrical goods and apparatus ...	290,734	+ 83,657	+ 658,226
Machinery	933,135	+ 84,544	+ 841,471
(Electrical machinery)	80,273	− 15,353	+ 8,742
Exports.—			
Electrical goods and apparatus ...	845,222	+185,960	+1,382,353
Machinery	3,879,708	+343,419	+3,066,835
(Electrical machinery)	439,951	+ 73,674	+ 535,423
Re-exports.—			
Electrical goods and apparatus ...	14,668	+ 1,425	+ 51,982
Machinery	116,112	+ 30 521	+ 111,546
(Electrical machinery)	4,820	− 3,422	− 16,493

Dutch Interests in Belgium.—The directors of the Lampe Belge propose to increase the capital from 5,000,000 fr. to 10,000,000 fr. by the issue of 10,000 new preference shares and 5,000 ordinary shares. Of the former 8,000 are to be allotted to the N. V. Philips' Gloeilampen Fabrieken, of Eindhoven, in return for the supply of machines and the grant of a licence to utilise patents.

British Manufacturers and Australian Tariffs. — An *Exchange Telegraph* message says that representatives of British manufacturers have urged the Minister of Customs to extend the protection given under the new clause, and pointed out that over 50 anti-dumping orders have been made under section 9. With reference to unfair foreign competition, they suggested that the protective machinery of the Industries' Preservation Act except where it was designed to protect Australian goods against unfair competition from whatever source, should be extended to British interests, thus conferring tariff preference at a time when British public opinion was increasingly favouring Imperial Preference. The Minister replied that the Government fully realised the desirability of fostering British trade with Australia. The position created by the changed currency conditions in Germany was under review, and the Government would shortly introduce into Parliament proposals meeting the deputation's wishes.

The Sydney Council and Tenders for Plant.—In connection with the purchase of plant and machinery for the new power house which the Sydney (N.S.W.) Council proposes to erect, Mr. Forbes Mackay, the city electrical engineer recently recommended that it should be incumbent upon tendering firms to prove that they had had experience in the manufacture of generating sets of 20,000-kW capacity. The Council has decided, however, that as this would exclude Australian firms, none of which has built a machine of this size, it cannot impose any restriction of the nature suggested.

Works Visit.—On July 4th, members of the Derby Railway Institute Radio Society and their friends paid a visit to the works of the D.P. Battery Co., Ltd., Bakewell. The visitors saw in course of production large Post Office batteries and "Kathanode" submarine batteries to a total weight of about 300 tons. Interest was aroused by the water wheels which generate most of the electricity used in the forming and charging processes.

A Change-over of Supply.—A dinner was held at Preston, on July 9th, to mark the official "change-over" from the generating plant at the Dick, Kerr works of the English Electric Co., to the Corporation supply from the Ribble power station. The works plant was only installed two years ago. Henceforth the works will take 1,100 kW from the Corporation; they are the town's first large customer. The existing generating station will be converted into a receiving substation. Among those present at the dinner were Councillor Heaney, Sir Arnold Gridley (general works manager of the English Electric Co., Ltd.), Mr. Livingstone (manager of the Dick, Kerr works), Mr. J. Simpson, the borough electrical engineer, and several textile employers.

For Sale.—By order of the Trustee in Bankruptcy, Mr. E. H. Hawkins, Messrs. Trubshaw & Taylor will sell by auction at 9, Weardale Road, Lee, on July 28th, the stock-in-trade of Moir & Watts, electrical and wireless engineers. By order of the Chief Ordnance Officer, Messrs. Horne & Co. will sell by auction on July 29th, at the Central Ordnance Depôt, Chilwell, Notts, engineering and laundry machinery, wireless stores, &c. By order of the receiver for the debenture holder, *re* Messrs. W. S. Jeal & Ebury Engineering Co., Ltd., of Union Wharf, Redhill Street, N.W.1, Messrs. H. Butcher and Co. will sell by auction at the Victoria Hotel, Mornington Road, on July 22nd, the electric accumulator manufacturing plant and stock, &c. (See our advertisement pages to-day.)

Copper, Lead, and Rubber Prices.—Messrs. F. Smith and Co. report, July 14th:—Copper (electrolytic) bars, £65 15s., 10s. inc.; ditto, ditto sheets, no change; ditto, ditto wire rods, £75 15s., 10s. inc.; ditto, ditto h.c. wire, 9½d., 3/16d. inc.

Messrs. James & Shakespeare report, July 14th:—No change in the price of copper bars (best selected), sheet and rod; English pig lead, £35 15s. 10s. inc.

Messrs. E. Till & Co. report, July 14th:—India rubber, Para, fine, 3s. 9d., 8d. inc.

The Swiss Glow Lamp Industry.—The Licht A.G., of Goldau, which has absorbed all the Swiss glow lamp makers under the leading of the Osram Company, of Berlin, and the Dutch firm of Philips, has changed its title to the Licht A.G. Ver. Gluhlampen Fabriken, and increased its share capital from 1,400,000 fr. to 2,800,000 fr.

Russian Orders for England.—It was reported last week that M. Rakovsky, the Russian *chargé d'affaires* in Great Britain, had returned from Russia with orders for English firms to the aggregate value of £15,000,000. Specific mention was made of electrical, agricultural, and textile machinery.

Metal Workers and Longer Working Hours.—At the annual meeting of the British Section of the International Metal Workers' Federation, at York on July 11th, a resolution was passed viewing "with much concern" the proposals of the Engineering and Allied Employers' Federation for the extension of the working week. The resolution further called upon the British and other Governments to give effect to the Washington Convention on working hours. Another resolution called attention to the probable effect upon the British metal industries of the attempt by Belgian employers to further decrease the wages of workers in that country's metal trades.

Great Britain and Latin-American Trade.—In addressing a meeting of representatives of the British and Latin-American Chamber of Commerce and visitors from South America at Wembley on July 11th, Sir Douglas Newton, M.P., said, according to a *Financial News* report, that we seemed to be losing from preventable causes some of the trade which we ought to be doing with Latin-American countries. In 1913 the export trade to Latin-America represented something like 9½ per cent. of our export trade, and in 1922 that trade had very considerably dwindled. He hoped that an influx in the Latin-American countries of British capital would be encouraged. Already we had some £1,500,000,000 invested in those countries, and that capital must receive fair treatment because trade could only develop with that.

A French Electrical Syndicate.—The Syndicat Professionnel des Industries Electriques has decided to convert this organisation into the "Syndicat Général de la Construction Electrique." The object of the new association is to group together all the syndicates in the various branches of electrical construction. The combinations already constituted and belonging to the new body are the *chambre syndicale* of makers of heavy machines and the syndicates of makers of other machines, apparatus, and lamps. Other combinations are expected to join. The representatives of the four syndicates mentioned have established a provisional office for the general syndicate, with M. Charles Laurent as the president.

Large German Cable Order.—The *Financial Times* reports that the Felten & Guillaume Co. has received the order for a submarine cable from Emden to the Azores. This will occupy the Nordhammer works of the company for about a year.

Lighting and Power Notes.

Accrington.—Electricity in Bulk.—The Corporation has been asked for the terms upon which it would be prepared to furnish a bulk supply of electricity to Burnley. The matter has been referred to a special committee for consideration.

Algeria.—Biskra.—The Société d'Electricité de Biskra is in negotiation with the municipal authorities of that town with regard to the extension of the concession for a further 40 years.

Basingstoke.—Year's Working.—The accounts for the past year's working of the undertaking (engineer: Mr. F. Swarbrick) show a total revenue of £15,040, as compared with £13,945 for 1923-4. The working costs were £7,705, against £5,885, leaving a gross surplus of £7,334 (£8,060). After deducting the capital charges, a net profit of £2,387 is shown, excluding £500 placed to the reserve and renewal fund, against £3,606 for the preceding year. The capital expenses for the year were £4,180, including £2,533 for mains, making a total capital expenditure of £65,683. The energy sales for the year amounted to 1,027,155 kWh, and the maximum demand on the station was 637 kW.

Brighton.—Loan Sanctioned.—The Electricity Committee has obtained sanction to borrow £22,400 in connection with the supply of electricity to Rottingdean and the Portobello districts.

Birmingham.—Loan Sanctioned.—The Electricity Committee has obtained sanction to borrow £550,000 for plant and £100,000 for buildings.

Caerphilly.—Electricity Supply.—The Urban Council, after considering a scheme of electric lighting submitted by Messrs. Arthur Ellis & Partners, consulting engineers, has decided not to embark upon an electricity scheme for Tredegar.

Canterbury.—Loan Sanctioned.—The Town Council has received sanction to a loan of £3,000 for a new feeder cable from the electricity works to Wincheap Street.

Chesterfield.—Extension of Supply.—The Electricity Committee has been informed of a proposal to form the Whittington and District Electricity Supply Co. for the purpose of supplying electricity to New Whittington and District. The town clerk has replied that the Corporation has decided to extend its mains to New Whittington, and that therefore consent to the proposed company's affording a supply cannot be given.

Continental.—Belgium.—At the recent annual meeting in Brussels of the Société d'Electricité du Nord de Belgique it was stated that the company's power station was now supplying electrical energy to no fewer than 100 localities with a total population of 526,000. During the past year the company's distributing mains had been extended to a total of 1,030 miles, of which 476 miles was primary and 554 miles secondary mains. Fifty-five miles of 50,000-V aerial transmission lines had also been completed between Louvain and Tirlemont and between Malines and Baesrode.

Switzerland.—The Brown Boveri Co., of Baden, has commenced work on the establishment of a h.p. main to connect the hydro-electric stations at Laufenburg and Murgental. The cable will be carried on masts ranging in height from 82 to 94 ft., and spaced at intervals of about 220 yards. The line is later to be extended to the Ruhr coal mining area so that in periods of plentiful water supply energy can be exported to Germany, and in water shortage periods electricity can be supplied from the power stations in the Ruhr coal area.

Coventry.—Year's Working.—The accounts of the Corporation electricity undertaking (engineer: Mr. G. Tough) record a total revenue of £258,665, as compared with £221,417 in 1923-24. Against this was charged working expenditure of £158,279, as against £116,415, leaving a gross profit of £100,385 (£105,002). After deducting capital and other charges, there was a net surplus of £37,175, as compared with £47,944 in the preceding year. The capital expenditure during the year amounted to £44,194, the chief item being £30,910 for mains and services. The amount of energy sold was 55,137,602 kWh, an increase of 27.2 per cent., and the average price per kWh obtained fell from 1.224d. to 1.126d. The number of consumers increased from 11,283 to 12,529.

Cuckfield.—Objection to Overhead Lines.—The Urban Council having maintained its objection to the overhead system of supplying electricity to the town, the Haywards Heath Electric Supply Co. has intimated to the Council that an appeal is being made to the Ministry of Transport for consent to use overhead lines.

Dover.—Electricity in Bulk.—An agreement has been reached between the Town Council and the Folkestone Electricity Supply Co. for a mutual supply of electricity in bulk. The supply is to be by overhead cable along the Dover-Folkestone road.

Douglas (I. of M.).—Year's Working.—The report on the working of the Corporation electricity undertaking (engineer: Mr. B. Kelly) for the year ended March 31st last shows a total income of £13,878, as compared with £7,254 in the preceding year in which the supply was commenced. Working expenses amounted to £7,529 (£3,045), leaving a gross profit of £6,349 (£4,408). After providing for capital charges, there was a

net surplus of £2,966, as against £1,103 in 1923-24. The capital expenditure, which included £13,737 for machinery, amounted to £28,549. The sales of electrical energy increased from 265,583 to 554,031 kWh.

Dumfries.—PROPOSED HYDRO-ELECTRIC SCHEME.—The Town Council proposes to proceed with a scheme for harnessing the River Nith for generating electricity, and a deputation is to visit Chester to inspect a similar scheme in operation there. The ultimate cost of the undertaking will be £15,000, but it is only proposed to proceed with a portion at first at a cost of £2,500.

Eastbourne.—INQUIRY.—The Ministry of Transport is to hold an inquiry with regard to the application of the Corporation to erect overhead lines in Willingdon.

East Anglia.—ELECTRICITY IN BULK.—Conferences between the authorities of Norwich, Great Yarmouth, and Lowestoft are to be called to further consider the question of the bulk supplies between the towns.

Faversham.—APPLICATION FOR LOAN.—The Town Council has decided to apply to the Electricity Commissioners for a loan of £2,822 for mains renewals.

NEW PLANT.—The new plant at the electricity works, which includes two Browett-Lindley engines, a balancer and dynamo, an oil purifier, and water-cooling plant, was formally inaugurated by the mayor on July 8th.

Grange.—ELECTRICITY IN BULK.—The Urban Council having sealed agreements for a supply of electricity in bulk from Barrow-in-Furness, has issued instructions for the preparation of a distribution scheme for approval so that tenders may be in hand immediately sanction to the scheme is obtained.

Hastings.—STREET LIGHTING.—The Town Council is to convert the remaining street gas lamps to electricity, and is applying for sanction to a loan of £17,850 for the necessary mains.

Huddersfield and Halifax.—Y. E. P. PROPOSAL.—The Yorkshire Electric Power Co. has intimated to the Huddersfield and Halifax Corporations that unnecessary expenditure in connection with the proposal to lay h.p. mains to connect the electricity undertakings of the two towns may be avoided by utilising the company's mains.

Hull.—YEAR'S WORKING.—In the accounts for the 32nd year's working of the Kingston-upon-Hull electricity undertaking (engineer: Mr. H. Bell), the total revenue is shown as £312,694, against £295,732 for the year 1923-24. The working expenses amounted to £183,079, against £163,727, leaving a gross profit of £129,615 (£132,005). After deducting the capital charges, the net surplus is £29,347, against £59,685 for the previous year. The total capital expenditure at the end of the year stood at considerably over £1,400,000. The kWh generated amounted to over 60 million.

India.—ELECTRICAL DEVELOPMENT IN MUSSOORIE.—There is a proposal to extend the supply of electrical energy in the important hill station of Mussoorie in the United Provinces at a cost of rupees 10 lacs. The municipal hydro-electric undertaking has reached the limit of its capacity and the demands for industrial and other purposes are increasing. Sources of further supply were recently examined by a committee of experts, which decided on the erection of an installation at Dehra Dun, using Diesel engines, linked with the hydro-electric undertaking of the Mussoorie Municipality.

EXTENSIONS IN CALCUTTA.—Electrical extensions are being carried out in Calcutta. The power house of the Gourpore Jute Mill is one of the biggest in Bengal, and it is now proposed to supply the towns of Hooghly Chinsurah, Chandernagar, and Serampore with electricity from this power house for lighting purposes. Under this project, the East Indian Electric Supply & Traction Co. will take its supply in bulk from the jute mill and link up Gourpore and the other towns. The Gourpore Jute Mill power house has five generators with a total capacity of 12,400 kW. The system is a.c., 6,600 V, 50-cycles.

CAUVERY FALLS SCHEME.—Sir Albion Banerji, the Dewan of Mysore, has announced the scheme for a seventh installation at the Cauvery Falls. The estimated cost of additional plant and the distribution of the extra 14,000 h.p. is Rs. 34,37,254. It is proposed to finance this scheme from the general capital resources without recourse to public borrowing, and the grant allowed for this in the next year is Rs. 20 lacs.

Ipswich.—YEAR'S WORKING.—The accounts of the Corporation electricity undertaking (engineer: Mr. A. S. Black) for the year ended March 31st show a total income of £97,170, as compared with £87,867 in 1923-24. The working expenditure amounted to £57,340, as against £50,507, leaving a gross surplus of £39,830 (£37,360). After deducting capital charges there was a net profit of £28,025, as against £26,610. The capital expenditure amounted to £37,800, the chief items being £16,154 for machinery and £13,456 for mains. The sales of electrical energy increased by 14.7 per cent. to 7,835,309 kWh, and the maximum supply demanded rose from 4,844 to 5,150 kW. During the year an order was placed for a 5,000-kW Brush-Ljungström turbo-alternator, which it is hoped to put in commission for next winter's load.

Kendal.—BATTERY INSTALLATION.—The Town Council has decided to install at the electricity works a battery as an auxiliary to the present plant, at an estimated cost of £6,000. This is in consequence of the failure of negotiations to secure a supply of electricity in bulk from a local firm.

Kirkcaldy.—YEAR'S WORKING.—The report of the burgh electrical engineer (Mr. O. F. Francis) on the working of the electricity undertaking for the year ended May 15th last shows a total revenue of £43,650, and working expenses of £26,089, leaving a gross profit of £17,561. In the previous year the income was £35,986, working expenses £23,050, and gross profit £12,936. After allowing for interest and other charges, there was a net surplus of £812, as against £2,485 in 1923-24. The electrical energy sold increased from 4,581,030 to 6,076,063 kWh, and the average price per kWh obtained fell from 1.88d. to 1.71d. The maximum supply demanded rose from 2,040 to 2,600 kW.

Korea. — HYDRO-ELECTRIC DEVELOPMENT. — According to *Eastern Engineering*, an application has been filed with the South Kamkyo provincial office, Korea, by several Japanese business men for permission to organise a company to generate electricity by means of the water of the Choshin and Fusen rivers, and undertake electro-chemical industry. The plan is to generate 217,070 kW by means of the River Choshin and 130,156 kW by means of the River Fusen, the electricity thus produced being supplied to the five provinces of South Kankyo, North Kankyo, Kogen, Keiki, and South Heian. Four hydro-electric power stations will be established on the Choshin and four on the Fusen, while transformer stations will be erected at various sites. The proposed company is to be capitalised at 200 million yen, and contemplates the establishment of an electro-chemical factory at a cost of 13 million yen.

Lincoln.—YEAR'S WORKING.—The report of Mr. S. Clegg, city electrical engineer, on the working of the electricity undertaking for the year ended March 31st last records a total revenue of £83,602, as compared with £76,752 in 1923-24. Working expenses were greater by £4,584 at £40,279, and the gross profit was £43,323 (£41,056). After deducting capital charges, there was a net surplus of £7,955, as compared with £6,186 in the previous year. The capital expenditure during the year amounted to £24,200, the chief item being £13,043 for mains and services. The electrical energy sold amounted to 16,388,362 kWh, an increase of 10.8 per cent., and the maximum supply demanded rose from 6,500 to 7,050 kW.

Lowestoft.—APPLICATION FOR LOAN.—The Electricity Committee is to seek sanction for a loan of £3,300 for the provision of a feeder cable to Oulton Broad.

Leeds.—PREMISES PURCHASED.—The Electricity Committee has purchased 28 and 29, Acre Street, for electricity purposes, at a cost of £12,000.

London.—POPLAR.—The report on the working of the borough electricity undertaking (engineer: Mr. J. H. Bowden) for the year ended March 31st last records a total revenue of £204,240, as compared with £139,270 in 1923-24. The working expenditure increased by £1,841 to £115,851, leaving a gross profit of £88,390 (£75,260), to which was added revenue from other sources, making a total of £90,933. After deducting capital charges, there was a net surplus of £30,977, as compared with £20,404 in the preceding year. The capital expenditure during the year amounted to £80,774, and the amount now spent on the undertaking stands at £958,480. The sales of electrical energy increased from 29,579,434 to 32,537,196 kWh, and the average price per kWh obtained fell from 1.53d. to 1.50d. The maximum supply demanded rose from 13,200 to 14,200 kW.

Maidenhead.—APPLICATION FOR LOANS.—The Town Council has applied to the Electricity Commissioners for loans of £5,000 for mains and services, and £3,500 in respect of the cost of the first section of converting equipment and alterations to the boiler room in connection with the bulk supply of electricity.

Marlborough.—LOAN SANCTIONED.—The Town Council has received sanction to a loan of £2,425 for electricity purposes.

North Wales.—WATER-POWER DEVELOPMENT.—According to *The Times Trade and Engineering Supplement*, rapid progress is being made with the new hydro-electric works of the North Wales Power Co. The new pipe line at Dolgarrog is completed and undergoing test before being taken over, while the work on the series of lakes to provide additional water has been advanced. The building of a new dam at Maentwrog for a new power station is well under way and a tunnel is also to be constructed to connect the two lakes. Meanwhile the construction of the overhead cables is making rapid progress, and the main cable lines to supply the London, Midland and Scottish Railway works at Crewe are approaching that centre.

Newcastle-under-Lyme.—YEAR'S WORKING.—The accounts of the Corporation electricity undertaking (engineer: Mr. A. J. C. De Renzi) for the year ended March 31st last show a total revenue of £12,147, as compared with £10,306 in the preceding year. Working expenses were £6,359, as against £5,208, leaving a gross profit of £5,788 (£5,098). After deducting capital charges, a net profit of £1,220 remained, as compared with a surplus of £705 in 1923-24. The sales of electrical energy increased from 462,106 to 824,688 kWh.

Northern Ireland.—AUGHNACLOY (Co. TYRONE).—The Town Council is to consider at its next meeting a proposal to light the town by electricity.

RATHFRILAND, (Co. DOWN).—The ratepayers recently met to consider the question of adopting a system of electric lighting for the town. The question arose in consequence of an application to the Newry No. 1 Rural District Council for permission to erect poles and supply electricity. It was resolved, with one dissentient, to recommend the District Council to grant facilities for the electric lighting of the town.

Canada.—HYDRO-ELECTRIC DEVELOPMENT.—The Ontario Government has authorised the Hydro-Electric Power Commission to develop power on the Ottawa River to meet the demands of the southern portion of the province. The Order in Council specifies five different sites as offering possibilities of successful power development.

Penmaenmawr.—INAUGURATION OF SUPPLY.—The electricity supply for the district was inaugurated by the chairman of the Urban Council on July 7th. The charges are 8d. per kWh for lighting and 3d. per kWh for power. Electricity is obtained in bulk from the North Wales Power Co. The Electricity Committee has recommended that electricity be adopted for street lighting, at an estimated cost of £1,327.

Peterborough.—YEAR'S WORKING.—The report on the working of the city electricity undertaking (engineer: Mr. H. A. Nevill) for the year ended March 31st last shows a total income of £53,876, and working expenditure of £26,716, leaving a gross profit of £27,160. The previous year's figures were:—Income, £40,371; expenditure, £20,985; gross profit, £19,386. After deducting capital charges, and capital outlay charged to revenue, a surplus of £246 was carried forward. The previous year's working resulted in a deficit of £5,664. The electrical energy sold increased from 4,273,955 to 6,817,669 kWh, and the maximum supply demanded from 2,800 to 3,400 kW.

Plymouth.—MAINS EXTENSIONS.—The Electricity Committee has authorised cable extensions at a cost of £2,491.

Price Reductions.—Reductions in the charges for electricity have been made or recommended in the following districts:—

NEWCASTLE-UNDER-LYME.—Lighting: Flat rate, 7d. per kWh; alternative rate for basement premises, £8 per kW per annum, plus 2d. per kWh; slot meters, 8d. per kWh. Power: Flat rate—first 200 kWh per quarter, 3½d. per kWh; all energy in excess, 3d. per kWh. Maximum demand system: Consumers with motors totalling more than 20 h.p., £5 per kW, plus 1d. per kWh. Heating and domestic purposes: Flat rate of 2d. per kWh, with a minimum charge of 10s. per quarter for the winter quarters, and 5s. for the summer quarters.

BURTON-ON-TRENT.—Lighting: From 6½d. to 6d. per kWh. Power: From 60 to 50 per cent. above the pre-war rate.

GLASGOW.—Except for domestic lighting, the charges have been reduced by ½d. per kWh.

HECKMONDWIKE.—Lighting: Reduced by 1d. to 6d. per kWh.

WORCESTER.—Lighting: Flat rate, from 6½d. to 6d. per kWh. Power, theatres and kinemas: The percentage increase reduced from 40 to 30. All charges subject to a discount of 10 per cent. for prompt payment of accounts.

Retford.—ELECTRICITY SUPPLY.—The Town Council has resolved to proceed with a scheme for generating its own electricity in conjunction with the gas undertaking. Two schemes have been prepared by Mr. H. Seabrook, one costing £10,050 and the other £17,200. It is anticipated that the station will be in operation by June, 1926.

Ross.—STREET LIGHTING.—The Urban District Council is asking the local Gas Company and Electric Light Co. to submit tenders for the lighting of its area.

Sheffield.—ELECTRICITY EXTENSIONS.—The Electricity Committee has approved extensions of works at an estimated cost of £7,446 and extensions of mains for general distribution purposes at an estimated cost of £11,179.

PURCHASE OF UNDERTAKING.—The Yorkshire Electric Power Co. and the Sheffield Corporation have agreed to appoint Mr. W. H. Patchell, consulting engineer, of London, as sole arbitrator, to settle the amount of the purchase money to be paid by the Corporation for the purchase of the undertaking of the company in the area of Wadsley.

Silsden.—ELECTRICITY SUPPLY.—The Urban District Council has entered into negotiations with the Keighley Corporation with a view to a supply of electricity being obtained for the district.

Sleaford.—NEW PLANT.—The Urban District Council is to install two oil engines at the electricity works with accessories, at an estimated cost of £8,207, and application is to be made for sanction to a loan to cover the expenditure.

Southport.—YEAR'S WORKING.—The accounts of the Corporation electricity undertaking (engineer: Mr. E. Moxon) for the year ended March 31st last record a total revenue of £89,339, as compared with £84,076 in the preceding year. Working expenses were £42,550, as against £37,209, leaving a gross profit of £46,789 (£46,867). Capital charges absorbed £28,134, and there was a net profit of £18,656, as compared with £18,225 in 1923-24. The amount spent on capital account was £24,433, and included £13,902 for mains and services. The sales of electrical energy increased from 5,514,115 to 6,018 541 kWh, and the maximum supply demanded from 3,152 to 3,681 kW. The extension of the boiler plant was commenced during the year, and it is hoped to have the work completed in time for next winter's load. The Birkdale District Electric Supply Co., Ltd., commenced taking a bulk supply in January last.

Special Orders.—The Electricity Commissioners have submitted to the Minister of Transport for confirmation, Special Orders made by them for the supply of electricity in the following districts: The urban districts of Sutton-in-Ashfield, Huthwaite and Kirby-in-Ashfield, and parts of the rural districts of Basford and Skegley, by the Derbyshire and Notts. Electric Power Co.; the urban district of Grange by the Council; the urban district of Ashford and the rural district of West Ashfield, by the Urban District Council; in various parts of the County of Renfrewshire, by the Strathclyde Electricity Supply Co., Ltd.

Application has been made by the Urban District Council of Portmadoc for an Order to supply electricity in its area.

Application is being made by the Corporation of Gloucester to supply electricity within the Rural District of Gloucester; the Corporation of Birmingham to supply electricity within the Rural District of Solihull and part of the Rural District of Meriden; the Southern Counties Electric Light and Power Supply, Ltd., to supply electricity within the Rural District of Sturminster, Dorset.

Stockton.—ASSISTED WIRING SCHEMES.—The Town Council has issued instructions for assisted wiring schemes for private houses to be put into operation.

MAINS EXTENSIONS.—The Electricity Committee has approved of the proposal to lay a high-pressure main from the works to the Durham Road area, and erect a small outdoor sub-station at an estimated cost of £5,500. The manager is to report again when anticipated developments take place.

Sunderland.—STREET LIGHTING.—The Corporation has received sanction to a loan of £100,000 for mains in connection with the conversion of the street lamps from gas to electricity.

Thrapston.—OPPOSITION TO SCHEME WITHDRAWN.—The Rural District Council has consented to the application of the Rushden and District Electric Supply Co., Ltd., for permission to use overhead h.p. and l.p. mains in the Council's area. The Council had previously declined to consent to the use of overhead lines.

Tunbridge Wells.—LOAN SANCTIONED.—The Town Council has received sanction to a loan of £6,500 for extensions to the electricity works.

Walsall.—YEAR'S WORKING.—The accounts of the electricity undertaking (engineer: Mr. H. A. Howie) for the year ended March 31st, 1925, record a total revenue of £100,151, against £92,744 for the preceding year. The working expenditure amounted to £53,955, against £43,228, leaving a gross profit of £46,196 (£49,516). The deduction of capital charges leaves a net profit of £14,830, as compared with £18,824 for the year 1923-4. The capital expenditure during the year amounted to £40,027, making a total of £429,167. The sales of electrical energy increased from 12,087,881 to 13,953,947 kWh, and the average price per kWh decreased from 1.84d. to 1.72d. The maximum supply demand for the year was 5,700 kW, representing an increase of 500 kW.

Watford.—APPLICATION FOR LOAN.—The Town Council has applied to the Electricity Commissioners for loans amounting to £55,550 for additional plant at the electricity works.

Wimbledon.—YEAR'S WORKING.—We have received from Mr. A. E. McKenzie, borough electrical engineer, a copy of his report on the working of the electricity undertaking for the year ended March 31st last. The revenue account shows a total income of £116,147, as compared with £107,826 in the preceding year. The working expenditure was £61,012, as against £50,625, leaving a gross profit of £55,134 (£57,201). Capital charges, &c., absorbed £31,587, and there was a net surplus of £23,971, as compared with £30,408 in 1923-24. A total of £75,857 was spent on capital account during the year; this included £31,145 for machinery and £25,947 for mains and services. The total sales of electrical energy increased from 8,570,130 to 11,010,062 kWh, and the average price obtained per kWh fell from 2.882d. to 2.381d. The second 3,000-kW turbo-alternator was installed during the year, and an order was placed for a new 50,000-lb. boiler and economiser.

Woolwich.—ELECTRICITY EXTENSIONS.—The Town Council has adopted a recommendation to carry out extensions to the electricity works, at an estimated cost of £110,000.

Worcester.—YEAR'S WORKING.—The report on the working of the Corporation electricity undertaking (engineer: Mr. C. M. Shaw) for the year ended March 31st last shows a total revenue of £57,543, as compared with £45,867 in the preceding year. Working expenses amounted to £32,299, as against £27,490, leaving a gross profit of £25,243 (£18,377). After allowing for capital charges, there was a net surplus of £7,581, as compared with £2,714 in 1923-24. During the year £26,377 was spent on capital account, and included £18,780 for mains and services. The electrical energy sold amounted to 6,942,757 kWh, an increase of 742,574 kWh, and the maximum supply demanded rose from 4,214 to 4,443 kW.

EXTENSION OF SUPPLY.—The Electricity Committee has recommended to the City Council that applications be made for

sanction to a loan of £33,000 to cover the cost of extending the electricity supply in an area of about 33 square miles, a Special Order for which has already been obtained. The engineer, Mr. Shaw has suggested that the greater part of the transmission and distribution should be carried out on the overhead system.

Worksop.—ELECTRICITY SUPPLY.—The Urban District Council has decided to extend its existing power station and is therefore abandoning negotiations for a bulk supply of electricity from Rotherham Corporation.

Tramway and Railway Notes.

Continental.—SWEDEN.—Work is well in hand on the electrification of the Stockholm-Gothenburg section of the Swedish State Railways, and it is expected that the whole line, a distance of about 286 miles, will be completed by the end of the present year. Single-phase current at a frequency of 16 2/3 cycles and 16,000 V is being used, the energy being taken from the State-owned system of main three-phase transmission lines at various sub-stations. The three-phase lines have pressures varying from 50,000 to 130,000 V, which will be transformed down to 6,000 V. The single-phase energy will be generated at 3,000 V and stepped up to 16,000 V. Of the 50 electric locomotives ordered, 10 will be allotted for passenger and 40 for goods service. The cost of the electrification work on the line is estimated at about £2,149,000, including £578,500 for the necessary locomotives, while the power consumption is estimated at 50 million kWh per year.

BELGIUM.—A new electric tramway is approaching completion between the Central railway station in Antwerp and Dam.

The Société des Tramways Electriques du Pays de Charleroi has applied for a concession for an extension of its electric tramways to provide a connection between the railway station at Couillet-Montignies and Chatelet.

Chesterfield.—RAILLESS CARS.—The Town Council has decided to adopt a railless-car system in place of the present tramway system, but has postponed the beginning of the work for twelve months. The tender for the conversion of the overhead equipment and the supply of 14 vehicles was £27,548.

Hull.—YEAR'S WORKING.—The report on the working of the Corporation tramway undertaking (general manager: Mr. E. S. Rayner) for the year ended March 31st last shows a total income of £326,549, as compared with £328,698 in 1923-24. Working expenses totalled £255,986, as against £236,288, leaving a gross profit of £70,563 (£93,773), to which was added interest from various sources, and a grant of £1,050 from the Unemployment Grants Committee, making a total of £74,293. This was dealt with as follows:—Interest, £20,918; loan instalments, £17,383; annual contribution in respect of cost of widening streets on tramway routes, £2,981; income tax, £9,978; borough fund, £12,000; deficit on motor-omnibuses, £4,777; reserve fund, £6,255. During the year £75,991 was spent on capital account, the chief item being £64,266 on permanent-way. The number of passengers carried increased from 60,316,860 to 62,387,677, and the car-miles run from 4,529,379 to 4,570,277.

Irish Free State.—DUBLIN.—The offer of the Dublin United (Electric) Tramway Co., Ltd., to take over the recently-closed Dublin and Lucan Tramway has been considered by the Dublin City Commissioners. While they are favourable to the proposal, the Commissioners state that they cannot undertake the responsibility of postponing for 42 years the date upon which the tramway may be acquired by the Corporation. With regard to the supply of electricity by the late Dublin and Lucan Tramway Co., the Commissioners say that this supply was non-statutory, but they are willing to agree to its continuance, it being understood that this in no way prejudices the Corporation's rights in the event of an extension of the city boundaries.

London.—SOUTHWARK BRIDGE EXTENSION.—The extension of the L.C.C. tramway across Southwark Bridge was opened by the Lord Mayor of London, Sir Alfred Bower, on Tuesday last. The extension has cost nearly £56,000.

Lostock Light Railway.—EXTENSION OF TIME.—The Minister of Transport has extended the time for the completion of Lostock Light Railway by 12 months until June, 1926.

Liverpool.—YEAR'S WORKING.—We have received from Mr. P. Priestley, general manager of the city tramway undertaking, a copy of his report, together with the accounts for the year ended March 31st last. The total revenue amounted to £1,337,805, as compared with £1,394,986 in 1923-24, the falling off in receipts being due to the reduction of fares during the latter part of 1923. The working expenditure was £1,142,975, as against £1,063,324, leaving a gross surplus of £194,830 (£331,062), to which was added interest from various sources, and a contribution from the Unemployment Grants Committee, making a total of £217,791. After deducting capital charges, a surplus of £119,111 was carried to reserve, renewal and depreciation account. The previous year's working resulted in a profit of £240,427. The capital expenditure during the year amounted to £197,510, and included £105,889 for permanent-way reconstruction, £44,660 for cars, and £27,310 for land, buildings, and fixtures. The number of passengers carried increased by 27,235,955 to 234,906,356, and constitutes a record for the undertaking. The car-miles run increased from 15,731,411 to 16,789,321. During the year four new routes were opened for traffic, and Orders have been obtained to construct tramways along five additional routes. About 26 miles of trolley wire has been renewed, and 15 miles erected in connection with extensions, &c.

Northampton.—YEAR'S WORKING.—The accounts of the Corporation tramway undertaking (general manager: Mr. J. F. Cameron) for the year ended March 31st last records a total revenue of £83,596, as compared with £80,287 in the preceding year. Working expenses totalled £59,504, as against £54,231, leaving a gross profit of £24,091 (£26,056), to which were added contributions from the Museum and Education Committees, making a total of £24,418. After providing for capital charges there was a net surplus of £13,172, as compared with £15,053 in 1923-24. The number of passengers carried increased from 12,121,947 to 13,163,318, and the car-miles run from 822,141 to 841,840.

Sheffield.—NEW TRAMCARS.—The Finance Committee of the City Council has approved the purchase of 50 new tramcars.

Southern Railway. — ELECTRIFICATION EXTENSIONS. — On Thursday, July 9th, the electrification of the line from Waterloo to Guildford, was officially inaugurated; and on Sunday, July 12th, three branches of the South-Eastern sections of the suburban lines, Victoria and Holborn Viaduct to Orpington, St. Paul's to Shortlands *via* Catford), and St. Paul's to the Crystal Palace (high level), were run electrically for the first time. These extensions amount to nearly 200 track miles. There were a few minor breakdowns and a certain amount of delay on July 13th, the first full-traffic day.

Telegraph and Telephone Notes.

China.—TELEPHONE PROGRESS.—The Chekiang authorities have decided to set up a long-distance telephone service between Ningpo and Hangchow (Chekiang provincial capital); to save expense the wires are to be strung on telegraph posts. The long-distance telephone service between Tsingtao and Tsinan (Shantung provincial capital) has been opened. The successful operation of a long-distance service between Canton and Fatshan has caused the military authorities at Kongmoon to request similar lines for five West River districts which centre about Kongmoon; the line to be built first will be to Sunchong. A public telephone service between Hunchun and Hsiaosanch'ak'ou (Kirin province) has been established.

RADIO STATIONS.—A commercial "wireless" company is being formed in Canton; all stations at present at Canton, or in the vicinity, are controlled by the Government. The Tientsin station, built under the auspices of the Tientsin Telephone Administration for commercial purposes, has inaugurated its service; the wavelength is 1,000 metres.—*Eastern Engineering.*

Japan.—OSAKA TELEPHONES.—The Osaka Bureau of Communications has decided on the number of telephones to be installed in the eight prefectures under its jurisdiction in the new financial year. The telephones installed in the district last fiscal year were but 530; in the current year the number has, however, been increased to 3,300. Consideration has been given to the towns and suburban districts, where the price of the instrument is high. High prices rule in Ashiya, Mikage, Tengachaya, Sumiyoshi, &c., and in these places from eight to ten times more telephones than last year have been allocated, so as to regulate the market price. The actual expenses to be contributed to the Bureau by applicants for the installation of telephones are still kept strictly secret, but it is understood that in a place where the charge was 550 yen last year it will put up to 800 yen, &c.—*Eastern Engineering.*

South Africa.—RADIO COMMUNICATION.—In the course of a debate in the House of Assembly on the Post Office vote on July 6th, Mr. Boydell, Minister of Posts and Telegraphs and Public Works, stated that he anticipated that beam radio stations in South Africa and England would be ready for operation about November. The Union, he added, would be represented on the Committee in England for fixing rates for the Dominions' wireless services.—*Reuter* (Cape Town).

Sweden.—RADIO TELEGRAPHY.—The Grimeton radio station on the west coast of Sweden, which was put into operation a few months ago, appears to have gained the support of the public; 95 per cent. of the Swedish telegraph messages to the United States are transmitted by Grimeton, while it receives about 40 per cent. of the Swedish telegrams from that country. The new station is handicapped on the American side by the fact that the cable company has stations all over the States, which do not accept telegrams for transmission by "wireless." Nevertheless, there is a notable increase of messages carried in this direction also. According to *Swedish Export*, the new service has reduced the rates of the cable companies

to 33 per cent. below pre-war charges, while the installation and operating costs have turned out lower than estimated, and the business has been larger than was hoped for. The authorities at no time reckoned with more than 2 per cent. on the investment.

The Telephone Service.—Additional Trunk Lines.—The Postmaster-General announces that additional trunk telephone lines are now available for communication between London and Glasgow.

Glasgow Automatics.—The Glasgow Corporation proposes to replace the present telephone system in the City Chambers by an automatic system with provision for "dialling" direct to the central exchange.

Telegraph Developments.—Press Union Statements.—At a recent meeting of the Empire Press Union Sir Robert Donald is reported to have said that wireless telegraphy—and possibly even radio telephony—would be operative between England and the Dominions within about eight months. Sir John Denison-Pender, president of the Eastern Telegraph Co., detailed the work of his company since the war, involving the expenditure of £10,500,000 on new cables and the repair of old lines. Mr. Goddard, representing the Western Union Telegraph Co. of America, indicated that their latest development in cable improvements would practically amount to an eight-fold increased carrying capacity. Sir John Denison-Pender said that additional capacity provided to deal with the "rush" hours left them with a margin of capacity during non-rush hours, which had been utilised by the introduction of a new class of traffic at quarter rates—daily letter telegrams, subject to delivery after 48 hours—which had provided a new source of revenue. His company had decided to lay a loaded cable between Perth (Western Australia) and Cocos Island, and it was estimated that they should be able to get a capacity of over 2,000 letters per minute in one direction, as against 600 letters per minute with an unloaded cable. On his company's system the Press messages amounted in words to 22 per cent. of their total traffic, while the revenue from those messages was only two per cent. of the total receipts. Sir Campbell Stuart, member of the Pacific Cable Board, announced that from July 7th the Press rate for messages by the Pacific cable route would be reduced from 7½d. to 6d. per word.

Turkey.—New Radio Stations.—The Post Office has concluded an agreement with a French company for the installation of radio transmission and reception stations at Angora and Constantinople, the work to be completed in one year.—*Reuter* (Constantinople).

Telegraph Operators' Strike.—A simultaneous strike on the part of telegraph operators at Adana, Erzeroum, and Samsoun, which crippled the communications between these places and the interior, led the Government to take strong action against the strikers. or, although the alleged motive of their action was the obtaining of an increase of salary, the authorities believed that the simultaneous outbreak of the strike was prompted by Communists. The ringleaders have been arrested and dispatched under escort to Angora, where they will be tried.—*Reuter* (Constantinople).

Radio Notes.

Australia.—Labour Council's Station.—The Postal Department has decided to grant the application of the New South Wales Labour Council for a licence to establish a broadcasting station, and has allotted the proposed station a wave-length of 280 metres. The secretary of the Postal Department, Mr. H. P. Brown, has stated that the Council has undertaken to conduct the station in accordance with the regulations and not to commit any breach of the Telephone Act by using it for the transmission of information which, legally, can be transferred only by the Postmaster-General.

Germany.—It is reported that the broadcasting station at Munich increased its transmitting power on July 15th from approximately 1 to 10 kW, and it is practically certain, says the *Evening News*, that the other German stations will similarly increase their power in the near future.

Hospital Equipment.—The Colchester Board of Guardians has decided to install a broadcast receiving set in the Workhouse Infirmary for the benefit of the patients. Maidstone Rotarians are to equip two local hospitals with receiving apparatus.

International Radio Conference.—Geneva Meeting.—Representatives of France, Great Britain, Italy, Germany, Sweden, Switzerland, and Czecho-Slovakia took part in the above Conference, which opened at Geneva on July 6th. Great Britain was represented by Admiral Carpendale, president of the International Wireless Union, and Captain Eckersley, chief engineer to the British Broadcasting Co. Captain Eckersley presented a memorandum on the redistribution of the wave-lengths employed in Europe, and a sub-commission of seven members was appointed to draw up a scheme. He was elected president of the Conference, which concluded its labours on July 8th. Certain changes have been decided upon, but the necessity of keeping the older and more important stations on their present wave-lengths has been constantly kept in view. A fresh scheme for the distribution of wave-lengths was drawn up; on or about September 1st, certain transmitting stations in Europe will change their wave-lengths, and an experiment will be made in transmission after the hours of regular broadcasting so as to test the new scheme. A second trial will take place a fortnight later, and the results obtained will serve as a basis for the final discussion, which will take place in Geneva.

The Council of the International Wireless Telephony Union, sitting on July 9th, ratified the decisions reached during the Conference, and agreed to approach the various European Governments, through the Communications and Transit Section of the League of Nations, for permission to conduct experiments early in September. In the event of such permission being granted, a further conference of technical experts will be held at Geneva on September 21st and 22nd to examine the data collected by the office of International Wireless Telephony as a result of the experiment. In order that the decisions then made may be put into effect with the minimum of delay, the Council of the Union will assemble again on September 23rd and 24th.—*Reuter* (Geneva).

Musical Committee.—Advisory Body.—A Musical Committee has been appointed by the British Broadcasting Co. to advise on the musical programmes to be broadcast, with a view to associating still more closely the work of the company with the musical profession.

The B.B. Co.—Year's Working.—The accounts of the British Broadcasting Co. for the year ended March 31st last show that the excess of revenue over expenditure was £84,138, as compared with £8,812 a year ago. The maximum dividend of 7½ per cent. is recommended, and the balance of £79,685, against £723, is carried forward. During the year licence fees to the amount of £488,881 were received; the proportion of the tariffs received to date and allocated to the past year was £35,688, while sundry revenue, including the profit on the *Radio Times*, was £13,958. The cost of the programmes and operating and administration expenses totalled £414,199.

United States.—Wave-Band Increase.—While European broadcasting authorities are discussing wave-lengths with a view to a proper allocation between various countries, the U.S.A. have evolved a scheme to overcome similar difficulties of their own. The plan is to broaden the present band (300 to 546) to between 150 and 546 metres. The proposal will provide accommodation for 600 stations, allowing room for 40 more in addition to the present number. The idea is to separate the broadcasting stations by grouping the high- and low-power stations in different sections of the band.

Contracts Open and Closed.

(The date given in parentheses at the end of the paragraph indicates the issue of the "Electrical Review" in which the "Official Notice" appeared in our advertisement pages.)

Open.

Australia.—Sydney.—July 27th. Municipal Council. One 5,000-kVA, 5,000/33,000-V step-up transformer; supply of gas-filled lamps. Specifications from the office of the Construction Engineer, Electricity Department, Town Hall, Sydney.

Postmaster-General's Department.—Automatic c.b. telephone exchange equipment, Canberra exchange.

New South Wales Public Works Department. September 14th. Electrical equipment, machinery, &c., for bascule bridge over Cook's River at General Holmes' Drive.*

September 21st. Material and apparatus for complete communication system, Barrenjack hydro-electric scheme.

Melbourne.—August 3rd. Electricity Commission of Victoria. Switchgear and accessories.

September 14th. 3,000-kVA transformers and spares. Particulars from the Purchasing Section of the Commission, William Street, Melbourne.

Postmaster-General's Department. August 11th. (Sched. C. 26), plugs and sleeves (switchboard). (Sched. C. 25), switchboard cords.

September 15th. Lamps, lamp caps, and lamp sockets. Tender forms from High Commissioner, London.

Barking.—July 28th. Electricity and Tramways Department. One 1,000-kW and one 500-kW rotary converters, with oil-cooled transformers and synchronising panels or, alternatively, one 1,000-kW and one 500-kW motor-converters (La Cour type), with starting and synchronising panels, e.h.p. switchboard, 3-wire d.c. switchboard and traction board. (July 10th.)

Belgium.—June 22nd. Belgian State Railway authorities (Office de l'Electricité), 25, Rue de la Charité, Brussels. Two lots of 160,000 metres of electric wire and four lots, totalling 110,000 metres, of specially-insulated wire. Particulars (Cahier des Charges Special No. 4-257) for 1 fr.

July 29th. Belgian Post and Telegraph authorities at La Salle Madeleine, Brussels. Thirty-eight lots of miscellaneous telephone material, including tables, jacks, 5,000 hand telephones, 100 voltmeters, and 5 000 condensers. Particulars on application to Cahier des Charges Special No. 3-126.

Bristol.—August 10th. Docks Committee. Four 3-ton movable electric jib wharf cranes for the Royal Edward Dock, Avonmouth. Spec. (£3) from Mr. T. A. Peace, chief engineer, Avonmouth Docks.

(*Continued on page 103.*)

Electricity Supply in Yorkshire.

The Yorkshire Electric Power Co.'s Development and Station Extensions.

SINCE it is now almost 21 years since the Yorkshire Electric Power Co. commenced to supply electricity in the West Riding, having obtained its Parliamentary powers in 1901, a brief record of its achievements will serve a useful purpose, particularly as the magnitude of the undertaking is not generally realised. The fundamental guiding principles have been the facts that the economical supply of electricity involves production on a large scale and distribution for all purposes by a single organisation over a wide area, the superseding of small inefficient generating stations, coal economy, and the standardisation of the system of supply. The company's area of 1,800 sq. miles, with a population of over 3,000,000 people, is one of the most industrialised districts of this country, and it includes one of the most important of the English coalfields, in which great developments are taking place; colliery supplies of electricity represent 38 per cent. of the Y.E.P. Co.'s output. Yorkshire is the seat of the textile industry. The first worsted-spinning mill to be driven electrically from a public supply was connected to the Y.E.P. Co.'s mains in 1905, and to-day 16 per cent. of the company's output is utilised in textile mills. In the steel trade the electric drive has proved to be particularly suitable, while the merits of electric furnaces need no emphasis. One of the largest steel-rolling mills in the world is driven by a 19,000-h.p. motor, fed from the company's mains. General power users purchase 26 per cent. of the electricity produced by the company.

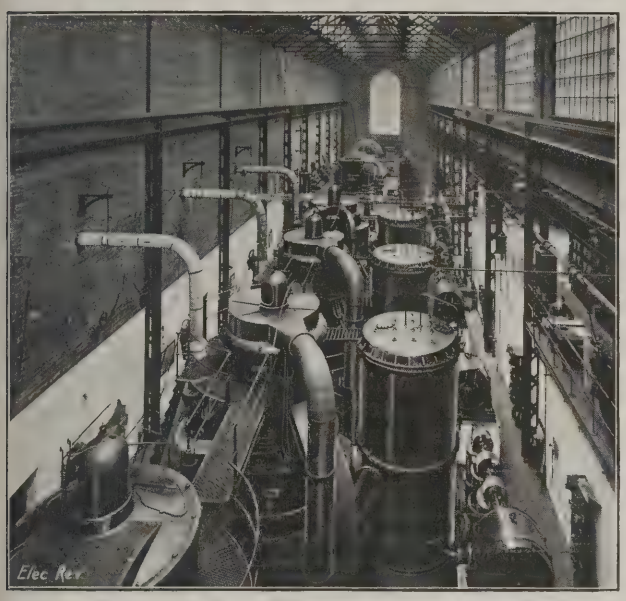


Fig. 1.—Original B.T.-H. Vertical Turbo-generators.

In addition to meeting the requirements of diverse industries, the domestic needs of a large population are catered for by the Y.E.P. Co.'s associated organisation, Electrical Distribution of Yorkshire, Ltd. Since the war many housing schemes have been completed, particularly in the coalfield, where entirely new villages have been built, the houses being supplied with electricity and the new streets electrically lighted. In all 70 distributing undertakings operate in the Y.E.P. Co.'s area, the availability of bulk supplies having enabled many of them to carry out their work without the necessity of building generating stations; in fact, those which had previously established generating plant have dispensed with it, with consequent economy. About 20 per cent. of the electricity produced by the company is disposed of in bulk, but it nevertheless supplies consumers direct in many cases. To do so in every case (as the company would prefer) is not, however, permitted owing to the form which legislation took in the past; the establishment of E.D. of Y., Ltd., was therefore a necessary step towards development, and the close co-operation of the two organisations has made electricity available in scattered districts which would otherwise be without it.

Fig. 2.—Thornhill Power Station, June, 1925.

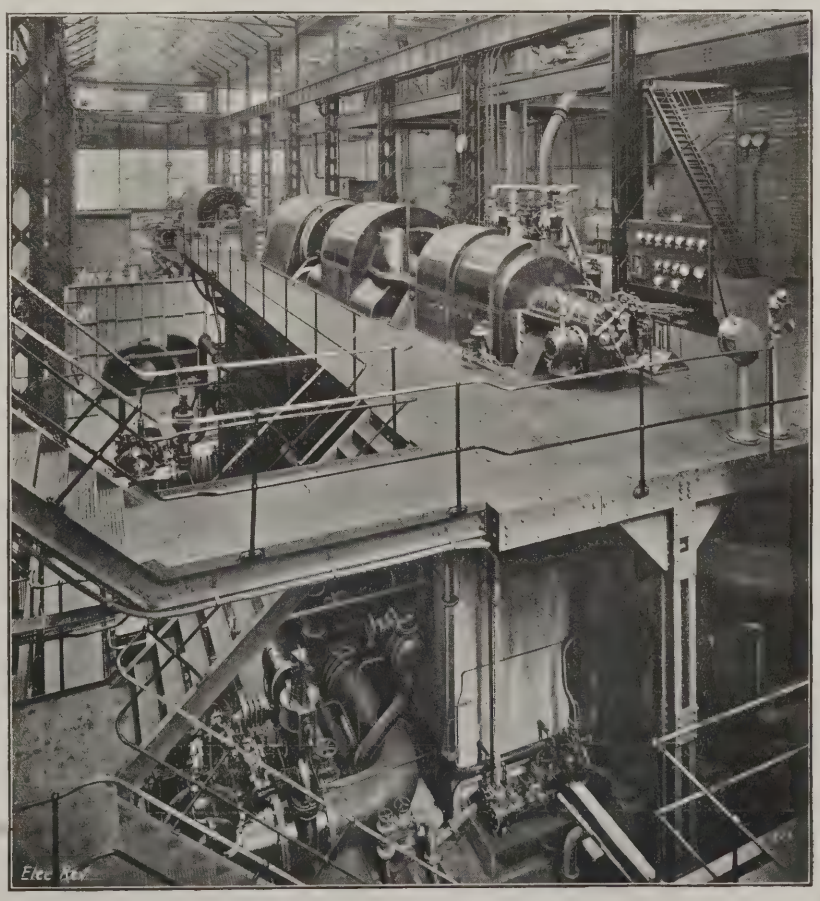

Fig. 3.—Thornhill Turbine Room, June, 1925.

The original steam generating station at Thornhill commenced to supply electricity to a colliery in December, 1904. The station originally contained three

1,500-kW, 1,000-r.p.m. British Thomson-Houston vertical turbo-alternators, fig. 1, with surface condensers and Edwards air pumps. The alternators generated three-phase current at a terminal pressure of 11,000 volts and a frequency of 50 cycles per second; 20 years ago it was somewhat unusual to find stations generating at such a high voltage, and the frequency then adopted by the company has since become the national standard. This original part of the station still exists, and now forms the centre block, and with the addition of a fourth British Thomson-Houston vertical turbo-alternator is now only used for stand-by purposes.

The station was gradually extended until in 1915 the urgent demands for electric power for munition making purposes called for the addition of two 6,000-kW British Thomson-Houston turbo-alternators, running at 1,500 r.p.m. and generating three-phase current at 11,000 volts, with surface condensers and steam-jet air pumps by Hick, Hargreaves & Co.

A second boiler house (No. 2) was built adjoining the turbine house extension. It contains at present three Stirling water-tube boilers, each having a normal evaporation of 39,000 lb. of water per hour, and two larger Stirling boilers of the tri-drum type, each having a normal evaporation of 50,000 lb., with Green horizontal tri-tube economisers. The working pressure is 200 lb. per sq. in., and superheaters raise its temperature from 382 to 600 deg. F. The boilers are fitted with chain-grate mechanical stokers and induced-draught

Fig. 4.—One of the Thornhill Boiler Houses.

plant. A further 50,000-lb. boiler, of the Babcock and Wilcox C.T.M. type is now under construction in this house. The boilers are fed by two 200,000-lb., 6,000-r.p.m. Weir pumps. The latest extensions are shown in cross section in fig. 10. They comprise a further extension to the turbine room, a new boiler house (No. 3) on the railway side, and a new switch house on the river side, which form part of a scheme for the complete remodelling of the station. The two new 12,500-kW Parsons turbo-alternators, fig. 3, are of the tandem reaction type with double-flow low-pressure cylinders, which exhaust into twin surface condensers. At their most economical rating of 10,000 kW, the steam consumption is 11.1 lb. per kWh. Each condenser has a cooling surface of 9,500 sq. ft., together with its own turbine-driven circulating water pump and motor-driven condensate pumps in duplicate; steam-jet air pumps of the two-stage type in duplicate are provided for each machine. The circulating-water pump turbines discharge into heaters through which the condensate is passed. Provision is also made for passing steam from the low-pressure stages of the turbines into feed heaters, thus further increasing the temperature of the condensate.

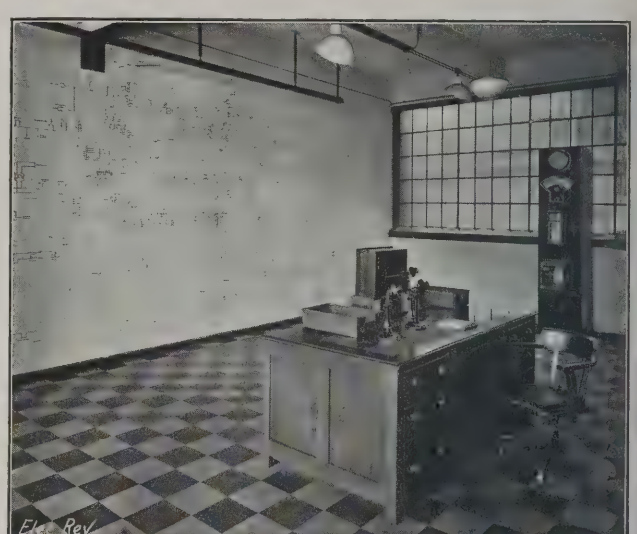

Fig. 5.—Control Room; System Diagram.

The alternators generate three-phase current at 11,000 volts, and run at a speed of 3,000 r.p.m. They are provided with external fans and a closed system of ventilation, the air being cooled by coolers inserted in the foundation block and supplied with cooling water from the circulating system. Alongside the turbines are the boiler feed pumps and hotwells. The feed pumps are of the Weir single-stage type, driven by steam turbines at 6,000 r.p.m., and each is capable of delivering 250,000 lb. of water per hour against a total pressure of 250 lb. per sq. in. The exhaust steam from the turbines is passed straight into the hotwells.

No. 3 boiler house, fig. 4, will supersede No. 1 boiler house entirely in one direction, and be also extended at the other end. It contains at present four steel-cased water-tube boilers, with economisers, chain-grate mechanical stokers, and induced-draught plant. Three of these boilers are of the Babcock and Wilcox C.T.M. type, each having 10,040 sq. ft. heating surface and 250 sq. ft. grate area; the fourth is of the Clayton & Shuttleworth bent-tube type, with a Bennis grate; each has a normal evaporation of 50,000 lb. of water per hour, and a working pressure of 200 lb. per sq. in., with a total temperature of from 600 to 650 deg. F. Each pair of boilers is arranged with a double drive for the chain grates, a motor being connected at each

Fig. 6.—Thornhill Switch Control Room.

end of a continuous driving shaft equipped with a separating coupling between the two boilers. The new

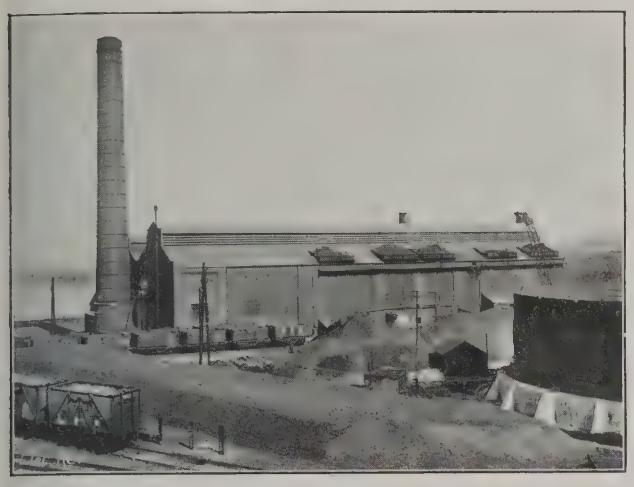

Fig. 7.—Barugh "Waste Gas" Power Station.

boilers have a thermal efficiency of 85 per cent. on the net calorific value of the fuel as fired. The boiler basement is constructed to accommodate a yard locomotive. The ashes are transported to low-lying ground on the site by electric vehicles. The overhead bunkers are filled with coal from siding hoppers by means of gravity bucket conveyors. Provision is made in the elevator tower for two conveyors, each having a capacity of 50 tons per hour; facilities exist for the reception of coal either by rail or canal. The coal consumption of the station is about 1,200 tons per week.

The new switch house and control room, figs. 5 and 6, are equipped with a 9-panel distribution board and a 13-panel generating board. The instrument scales on the former are distinctively coloured, those of the voltmeters being pink; ammeters, white; power factor meters, red; and the wattmeters blue and pink; the blue side indicating outgoing energy and the pink incoming. The main generator and feeder oil switches, of the totally-enclosed ironclad Reyrolle pattern, are on the first floor of the building. Each switch has a rupturing capacity of over 500,000 kVA at 11,000 volts, being operated remotely from the panels in the control room immediately above. A complete system of telephones and telegraphs connects the control room with the turbine and boiler houses and the other power stations on the system. Two large charts, one geographical and the other diagrammatical, fig. 5, showing the whole of the company's distribution mains, enable the control engineer to see at a glance the position of the controlling switches of all sub and generating stations, and he is thereby in touch with the whole of a system which covers an area of 1,800 square miles. The foundations for a new 33,000-V switch house are already down.

The Thornhill station is situated on the bank of the River Calder, and the screens are of the self-cleaning revolving open-disk type. Two new screens have been erected vertically, it having been decided that no advantage was gained by using the sloping screen. A lime-soda treating plant of 3,500 gallons per hour capacity is installed near the screens. Whereas in 1904 the site occupied 15 acres, the present area amounts to 85 acres. The duplication of all essential apparatus is one of the notable features, and applies to the auxiliary machinery for the turbo-alternators, the circulating pumps, and switchgear. The new station generates a kWh of electricity for less than 2 lb. of coal, the turbine steam consumption being 11.1 lb. per kWh. The company's engineer and manager, Mr. W. B. Woodhouse (president of the Institution of Electrical Engineers), being fully appreciative of the economies to be derived from the use of "waste heat," it is not surprising that his Barugh power station (figs. 7 and 9), near Barnsley, utilises a large quantity of coke-oven gas, as indicated in fig. 8, in addition to a considerable amount of coal. This station has now reached a capacity of 20,000 h.p., and the use of surplus gas, which would otherwise be wasted, results in a saving of some 20,000 tons of coal per year, the station being, for its size and due to the particular conditions of working, more economical than many larger ones. The company's latest development is the establishment of a station at Ferrybridge, which is at present under construction, fig. 11. It is situated on the River Aire, near Knottingley, and will ultimately be of 200,000 kW capacity, the first machines being of 26,000 h.p. each.

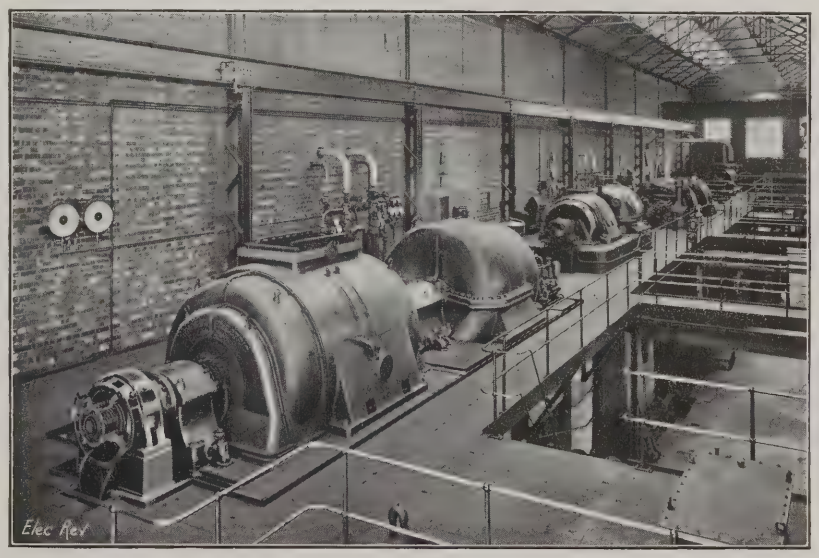

Fig. 9.—Barugh Turbine Room, June, 1925.

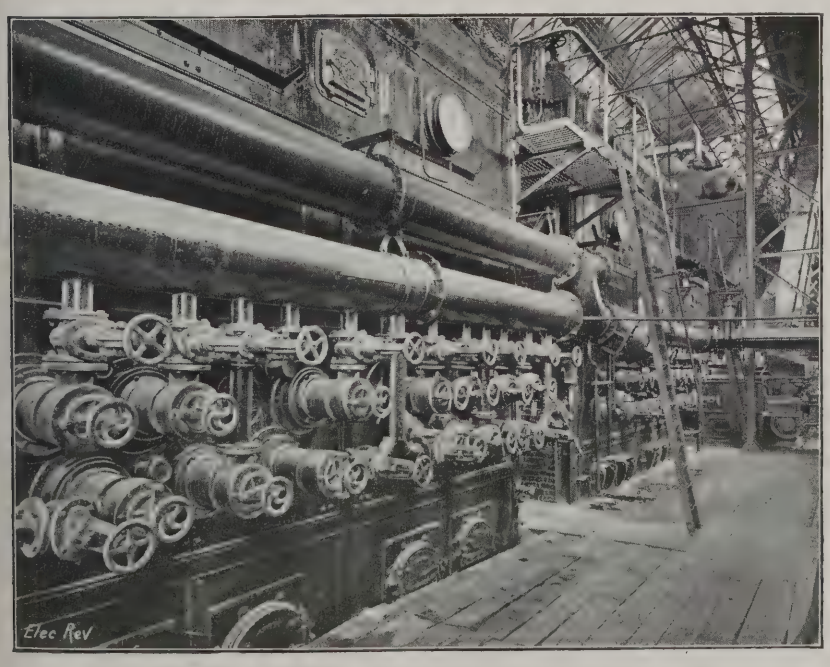

Fig. 8.— Barugh Coke Oven Gas-fired Boilers.

The h.p. transmission network consists of both underground and overhead lines, fig. 14, being an example of the latter, and inter-

connectors are being laid between the main stations for 33,000- and 44,000-V transmission, one for 44,000 V being in service between the Ferrybridge and Mexborough stations. Some 300 sub-stations are in use, (see Elec. Rev., June 5th, 1925, pp. 890-891) development plans will be proceeded with.

In the company's area of supply there are no less than 70 electricity undertakings, of which 31 (cover-

relieve congestion in the large manufacturing centres. In accordance with its policy of co-operation in the interests of economy, arrangements exist for the purchase of electricity by the Y.E.P. Co. from the Cor-

the following are somewhat striking examples of what has been already done:—The Elland Urban District Council shut down its generating station in 1921, prior to which the undertaking had been a burden on

Fig. 15.—Rural Sub-station and Overhead Line.

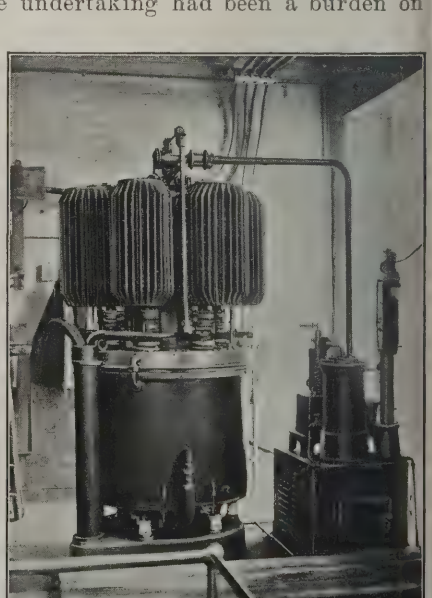

Fig. 16.—Mercury Arc Rectifier in Glass Works.

porations of Bradford, Leeds, Rotherham, and Sheffield, from generating plant that would otherwise be unoccupied. Now that certain legislative delays are ended

the rates; during the first year that a bulk supply was taken from the Y.E.P. Co. a gross deficit of £3,200 was turned into a gross profit of £1,138, thus enabling the

ouncil to make an immediate reduction of 12½ per ent. in its tariffs. The gross profit for 1923 and 1924 as averaged £5,200, and the reductions in the charges ow amount to nearly 30 per cent. in all since a bulk upply was first taken. During the same period the number of units consumed per head of population in the istrict has nearly been doubled. During the eight ears ended March, 1922, the Heckmondwike Urban District Council suffered an average annual loss of £1,547 n its undertaking, the equivalent of a 7d. or 8d. rate. ince that date the Council has been taking a bulk upply entirely from the Company, resulting in economies amounting to £3,000 or £4,000 per annum and a eduction of about 20 per cent. in the tariffs.

Another interesting case is that of the undertaking of he Holmfirth Urban District Council, which for the even years preceding 1923 made an average loss of 600 per annum, but after taking a bulk supply, a gross rofit of £1,700 was made in the first year, enabling he charges to be reduced forthwith. In the last three ears the consumption per head of population in the istrict has been more than doubled.

A further example is the undertaking of the Todmorden Corporation, which during the year prior to aking a bulk supply incurred a loss of £2,350. In he first year afterwards this loss was transformed into profit of £3,383, the revenue having increased by ver £2,000, and the operating costs decreased by 3,600. The profit for 1924 increased to £6,361, while he total reduction in the tariffs since the bulk supply as taken now exceeds 33 per cent. These reductions ave an immediate impetus to consumption, which has nore than trebled itself in the last three years.

The foregoing examples of what has been done for hese local authorities in the West Riding, who now urchase their supplies of electricity in bulk from the orkshire Electric Power Company, are a remarkable estimony to the efficiency of the large central generating station operating over a wide area.

Contracts Open and Closed

(*Continued from page 98.*)

Open.

Glasgow.—July 24th. Corporation. Electrical installation at the Belvedere housing scheme. Specification from the ngineer.

Grimsby.—August 1st. Electricity Department. Storage attery, booster, and switchgear. (July 10th.)

Leeds.—Library and Arts Committee. Electric lighting nstallation at the Public Library, Cardigan Road, Burley. Particulars from Mr. G. B. Howcroft, architect, Uppermill, ear Oldham.

London.—ST. PANCRAS.—September 3rd. Electricity Department. One 10,000-kW steam turbine, alternator, condensing lant, pipes, &c. (See this issue.)

BETHNAL GREEN.—July 20th. Electricity Department. L.p. ables and switchgear. (July 10th.)

ST. MARYLEBONE.—August 31st. Highways Department. One 200-kW turbo-alternator set with surface condenser and uxiliaries; one second-hand 200-kW, 200/220-d.c. generator et. (See this issue.)

H.M. OFFICE OF WORKS.—July 31st. Incandescent lamps. See this issue.)

Liverpool.—Waterworks Committee. Small electrically-lriven centrifugal pumps at Prescot, Lancs. Mr. J. R. Davidon, water engineer, 55, Dale Street, Liverpool. (£2 2s.)

Manchester.—July 20th. Electricity Department. Electric cooking ranges, and switches and cut-outs for 12 months. July 3rd.)

Electricity Department. Three-phase, 6,600-V switchgear or Dickinson Street and 6,600-V switchgear for Bowker Vale. See this issue.)

New Zealand.—WELLINGTON.—August 18th. Posts and Telegraph Department. Switchboard plugs.*

INVERCARGILL.—August 17th. Electricity Department. Four 67-kVA single-phase transformers.*

MARLBOROUGH.—September 22nd. Electric Power Board. Turbines, generators, and switchgear. (B.X. 1,904.)*

Nottingham.—August 7th. Electricity Department. One 0,000-kW turbo-alternator, with exciter, condenser, air pumps, il coolers, air coolers, and auxiliary plant. (See this issue.)

South Africa.—JOHANNESBURG.—August 1st. Municipal Council. Twelve a.c. power relays.*

*Further particulars can be obtained at the Department of Overseas Trade (Inquiry Room), 35, Old Queen Street, S.W.1.

Closed.

Brighton.—Electricity Committee. Accepted:—
Pulverised fuel firing equipment (£1,970).—Underfeed Stoker Co., Ltd.

Chesterfield.—Electricity Committee. Accepted:—
Three Cope's feed-water regulators for boilers.—James Gordon & Co., Ltd.

Glasgow.—Baths and Wash-houses Committee. Accepted:—
Electrical installation at Whiteinch Baths (£694).—Johnston, Park & Co.

Tramways Committee. Accepted:—
Special track work.—Hadfields, Ltd.
V.i.r. cable.—Siemens Bros. & Co., Ltd.

Guildford.—Electricity Committee. Accepted:—
Cable.—British Insulated & Helsby Cables, Ltd.

Hastings.—Electricity Committee. Recommended:—
Two 2,000-kVA transformers (£2,973).—Ferranti, Ltd.

Irish Free State.—Contracts placed by the Commissioner of Public Works, Dublin, during the month of June:—
Provision of a h.p. main, Governor-General's residence.—City Electrical Engineer, Dublin.
Altering and extending electric lighting system, Governor-General's residence.—Brooks, Thomas & Co., Ltd.
Electrical works and supplies, Dublin district.—Handley & Robinson, Ltd.—*Irish Builder and Engineer.*

DUBLIN.—Commissioners for the County Borough.—Nine firms submitted tenders for the supply of the Electricity Department's requirements of arc lamp carbons for the coming year, viz.:—

	9 mm. x 15 in. per 1,000 carbons.	9 mm. and 8 mm. x 15 in. per 1,000 carbons.	18 mm. and 12 mm. x 12 in. per 1,000 pairs.
	£ s. d.	£ s. d.	£ s. d.

Siemens-Schuckert ...	5 6 0	9 6 0	16 7 6
Chapman & Chapman ...	6 6 0	10 7 3	18 10 0

The lowest tenders in each case have been accepted, namely:—Beacon Carbons, Ltd., for 9-mm. x 15-in. and 9-mm. and 8-mm. x 15-in. carbons. E. A. Langrish & Co., for 18-mm. and 12-mm. x 12-in. carbons.—*Irish Builder and Engineer.*

Lamp Contracts.—The London, Midland & Scottish Railway Co. has renewed its contract with the Siemens & English Electric Lamp Co., Ltd., for Siemens gasfilled lamps; and the London & North-Eastern Railway Co. has placed a contract for six months' supply of metal-filament lamps with the Edison Swan Electric Co., Ltd. The General Electric Co., Ltd., has received a three-years' War Office contract for "Osram" vacuum and gasfilled lamps, and a six months' contract from the L. & N.E. Railway for "Osram" vacuum and gasfilled lamps and Robertson carbon-filament lamps.

London.—LAMBETH.—Board of Guardians. Accepted:—
Special electric light fittings for the board room.—Owen, Barnes & Co.

LONDON COUNTY COUNCIL.—Housing Committee.
Wiring and fittings for electric lighting in five block of tenements, East Hill estate:—

Heath-Pritchard, Ltd. (Accepted.)	**£1,656**
T. Clarke & Co., Ltd.	1,766
Smethurst & Co. (London), Ltd.	1,863
Alpha Manufacturing & Electrical Co., Ltd.	1,891
A. Meckhonik	1,896
Stegman & Co.	1,970

British Electrical Installations Co.	2,136
H. J. Cash & Co., Ltd.	2,229
Commercial Telephone & Electrical Co., Ltd.	2,310
Power Contracts, Ltd.	2,501
T. H. Smerdon	2,600
Griggs & Sons	2,740
Belgravia Electrical Co., Ltd.	2,867
G. A. Weston	3,731
W. E. Heath & Co.	4,174

Fire Brigade Committee. Accepted:—
Wiring and fitting for electric lighting new fire station, Peckham Road (£180).—Commercial Telephone & Electrical Co., Ltd.
Installation of motor generators, Bayswater fire station, and Peckham Road new fire station.—Crypto Electrical Co., Ltd.

Highways Committee. Accepted:—
Twelve months' supply of "Bitite" grout (3,000-4,000 tons).—Dussek Bitumen Co., Ltd.

Education Committee. Recommended:—
Electric lighting and equipment, London Printing School (£318).—A. Hawkins & Sons.

Reading.—Board of Guardians. Accepted:—
Electrical work in connection with the equipment of a new laundry at Battle Infirmary.—Haden & Sons, Ltd.

Spenborough.—Urban District Council. Accepted:—
Electrician's work required in connection with the new public abattoirs.—Butler & Horn.

Housing Committee. Accepted:—
Electrical installation in 60 houses now being erected for the Council.—Stead & Firth.

Stafford.—Staffs. Education Committee. Accepted:—
Installing electric light at Corporation Street schools (£213).—W. Hampton.

Uxbridge.—Fire Committee. Recommended:—
Installation of electric siren (£168).—Walters & Co.

Winchester.—Town Council. Accepted:—
Supply of electricity meters for 1 year.—Chamberlain & Hookham, Ltd.

INQUIRIES must be accompanied by a stamped addressed envelope.

We should be glad to learn the names of makers or suppliers of:—

NER-A-LITE shop-window fittings.

Notes.

The Women's Engineering Society.—AN INTERNATIONAL CONFERENCE.—At the British Empire Exhibition, Wembley, this week, an "international conference of women in science, industry, and commerce," is being held, under the auspices of the Women's Engineering Society and kindred bodies, including the Electrical Association for Women. The conference was to be opened on Wednesday by the President, H.R.H. the Duchess of York, with Lady Astor, M.P., in the chair, and after luncheon there was to be a tour of the Exhibition. The speakers and delegates were to be entertained to luncheon at the Wembley Garden Club by the President and Council of the British Electrical Development Association (Inc.), and amongst those present were to be Miss Margaret Bondfield, J.P., Mr. W. E. Woodhouse, Pres. I.E.E., and Miss V. Holmes, A.M.I.Mech.E. On Thursday the morning session was to be devoted to "Engineering, Chemistry, and Research," Miss C. Griff, A.M.I.A.E., presiding, and one of the papers was entitled "Electricity Applied to Mining," by Miss H. M. Davis; the subject for the afternoon was "Industrial Welfare and Factory Inspection," with Mrs. Willson, M.B.E., in the chair, and a reception was arranged for the evening. To-day, Mrs. Hoster will preside at the morning session, on "Commerce and Salesmanship," papers being read by Miss G. Burlton, B.A., on "Salesmanship" and by Miss L. F. Nettlefold, LL.B., on "The place of the Wholesaler in the Scheme of Distribution"; and in the afternoon, with Alderman Mrs. Hammer in the chair, the subject will be "Electricity—Domestic Science," papers being read on "Producing and Distributing Electricity" by Miss M. Partridge, B.Sc., and "At Home with Electricity," by Miss T. J. Dillon, B.Sc. and accompanied by a special demonstration of electrical apparatus. In the evening there will be a dance.

The L.C.C. Tramways.—The accounts of the London County Council tramways for the past year (which were summarised in our last issue, p. 80) came before the Council at its meeting on July 7th. Mr. Angus Scott attributed the deficit which had been incurred to unrestricted and wasteful omnibus competition. He pointed out, too, that a seventh of the tramway revenue was derived from workmen's fares which were unremunerative; the 'buses offered no such facilities. Although the undertaking had not covered all its charges, it was absurd to talk of scrapping a system which still had a £9,000,000 debt outstanding. He denied that the tramways were bankrupt; they were still a valuable asset to London.

Mr. J. C. Dalton considered that the system had outlived its usefulness. Nothing further should be spent on it and its abolition should be looked to.

Mr. J. P. Blake thought that it was impossible for the tramway to succeed if the view of the last speaker was that of the controlling party on the Council. He wanted to see the tramways working out their own salvation rather than receiving any form of "protection."

Mr. Gatti, chairman of the Finance Committee could not agree with the proposal which was often put forward that the tramway should be relieved of rates and road maintenance. He thought that the present serious position would be got over and the tramways restored to the position of prosperity which they occupied until recently.

Appointments Vacant.—Temporary vacancies in the Wireless and Electrical Branch of the Aeronautical Inspection Directorate (£235). Clerk (70s.), for the Sevenoaks and District Electricity Co., Ltd. Meter fixer and plumber-jointer, for the Workington Corporation. (See our advertisements pages to-day.)

The Manchester Annual Report.—A very bad error occurred in our review of the report upon the Manchester electricity undertaking (June 19th, p. 996), it being stated that the energy sold had increased from 24,905,469 kWh to 26,816,400 kWh. These figures are obviously incorrect for an undertaking the size of Manchester's; the correct figures are respectively 222,203,023 kWh and 257,352,920 kWh.

Smoke Abatement.—For the benefit of the delegates attending the Harrogate Advertising Convention a smoke abatement demonstration and lecture were given at the Harrogate electricity works by Mr. W. H. Casmey, of Burley-in-Wharfedale. The demonstration was arranged by Captain H. R. Webster (chairman of the Electricity Committee) and Mr. George Wilkinson (manager of the works) presided. Two Lancashire boilers were used for the demonstration.

Educational.—UNIVERSITY OF LONDON.—In the Faculty Engineering at University College diplomas in Electrical Eng neering have been awarded to Messrs. A. C. Beck, C. Mood S. R. Witt (with distinction), and W. A. P. Wykeham.

POLYTECHNIC EXTENSIONS.—Important items were consider by the London County Council Education Committee at i meeting on July 15th. A building grant of £50,000 towar the cost of the erection and equipment of a new polytechnic St. Pancras is proposed; the total cost is estimated at £112,74 This polytechnic will include a commercial department a a junior technical school for light engineering trades, says *T Times*. Among the grants recommended are a maintenan grant of £27,000 per annum for five years to the Imperial C lege of Science and Technology, South Kensington, and a bui ing grant of £30,000 for the extension of the Regent Stre Polytechnic. The governors of the Polytechnic contempla spending £250,000 in all on enlargements. They report th the Polytechnic has now over 12,000 students and 300 teache and that the demand on the accommodation has increased nearly 90 per cent. during the last 12 years, with the resu that many students have had to be refused admission.

Institution Notes.

Institution of Electrical Engineers.—A.M.I.E.E. EXAMIN TION.—The next examination will be held on October 29t 30th, and 31st, 1925. Candidates must be either Students Graduates of the Institution, or have lodged with the secreta a duly completed form "E" for election as Associate Membe Entry forms for the examination, which must be completed a returned by September 1st, and particulars regarding electi to membership of the Institution may be had on applicati to the secretary, The Institution of Electrical Engineers, Sav Place, Victoria Embankment, W.C.2.

Diesel Engine Users' Association.—MECHANICAL INJECTIO —At the July meeting of the Association, held at Maidenhea some notes on the "Working of the Ruston Mechanical Inj tion Oil Engine" were presented by Mr. C. O. Milton, and d cussed. The author gave detailed information concerning experience in the working of such engines, and explain the conditions and special circumstances which he had to ta into account when ordering this particular type of engi One of the engines had already been at work for over 8,0 hours. Prior to the meeting members took the opportunity visiting the Maidenhead electricity works to see the t mechanical high-compression engines which are installed the

Permanent-way Institution.—SHEFFIELD CONFERENCE.—T business proceedings at the annual conference of the P manent-way Institution, held last week at Sheffield, were int spersed with a considerable round of social functions and vis to local works. The delegates numbered about 150 from branches in Great Britain and the Colonies. Following t annual meeting on the first day of the convention, Mr. E. Wilson, of the Metropolitan Railway, presided at the annu dinner, at which Mr. Fearnley, manager of the Sheffield tra ways, referring to a suggestion that as Sheffield was the hor of so much that went to the making of a successful tramw system, the introduction of a "stainless car" should be co sidered, remarked that at last they had been successful getting stainless steel fittings in order to do away with t brasswork. Some sets had now been fitted, and they hop considerable economy would result. Mr. Joseph Ward t how the first steel rails came to be laid, and among the esta lishments visited by the delegates during the week were th of Messrs. Samuel Osborn & Co., Ltd., and the Titan Trac work Co., Ltd., where the visitors saw moulds for trackwo for railways and tramways, and were particularly interest in a big lay-out for the Sheffield tramways, as well as othe in process of construction. A 30-cwt. electric furnace w shown in operation, and the visitors were entertained luncheon by the directors, with Mr. Fredk. Osborn in t chair.

The Faraday Society.—At the annual general meeting the above Society, held on July 6th, the following officers a members of the Council were elected:—President: Profess F. G. Donnan. Past-presidents: Sir Robert Hadfield, Pr Alfred W. Porter, and Sir Robert Robertson. Vice-president Mr. W. R. Bousfield, Prof. C. H. Desch, Dr. W. H. Hatfiel Prof. W. C. Lewis, Mr. C. C. Paterson, Prof. A. O. Rankin and Dr. E. K. Rideal. Treasurer: Mr. R. L. Mond. Counci Prof. E. N. da C. Andrade, Mr. C. R. Darling, Dr. J. Coates, Dr. F. A. Freeth, Dr. B. A. Keen, Dr. E. H. Rayne Dr. F. C. Toy, Mr. H. T. Tizard, Dr. R. S. Willows, and Pr E. C. Williams. The report of the Council draws attention the fact that general discussions on the following subjects we held during 1924:—"Fluxes and Slags in Metal Melting a Working," "Physical and Physico-Chemical Problems Rel ing to Textile Fibres," "The Physical Chemistry of Igneo Rock Formation," "Base Exchange in Soils." It is t policy of the Society to co-operate wherever possible with oth scientific societies, and three of these discussions were he jointly. The policy of co-operation is also extended to t American Electrochemical Society, in that by a mutual arrang ment, the transactions of each society are supplied to t members of the other society at a special rate. In addition the general discussions, four ordinary meetings were hel During the year 33 new members were admitted to the Societ

There was an adverse balance of £293 on the year's work, due to the great amount of material published. While loath to diminish the Society's activities, it has been decided to limit the general discussions for the time being to two a year, and it is expected, as a result, to balance income and expenditure during the present year.

Institution of Mechanical Engineers.—NEWCASTLE MEETING.—In commemoration of the Centenary of the opening of the Stockton and Darlington Railway, members of the Institution of Mechanical Engineers, who met recently in Newcastle-on-Tyne, paid a visit on July 8th to the Faverdale works of the L. & N.E.R. Co. at Darlington, and there inspected the exhibition of locomotives and railway appliances. Luncheon was given by the L. & N.E.R. Co. to the visitors, who were presided over by Mr. H. N. Gresley, chief engineer of the L. and N.E.R. Co. Sir Hugh Bell, extending a welcome on behalf of the Railway Company, proposed the health of the Institution, and coupled with it the name of the president, Sir Vincent Raven. He regretted, he said, that the North-Eastern Railway Co.—not the L. & N.E.R.—was not the absolute pioneer in main-line electrification. That they had run the first railway in the kingdom was not bad; that they should have run an express electrical train from Newcastle to York would have been a fitting thing for them to have done. Sir Vincent, responding, said it was more economical to run trains electrically than by steam. He had pursued that line, and had visited other countries, which had gone ahead of us in that direction, mentioning America and Germany in particular. He believed that before he left the N.E.R. Co. he had persuaded Sir Hugh Bell and also Sir Arthur Pease that, given certain conditions—density of traffic and cheap electricity—it would be a great advance. He thought it would be only a question of time before they would see something done in that direction.

A number of members visited the works of Messrs. A. Reyrolle & Co., Ltd. Hebburn-on-Tyne. They were received by Mr. Norbert Merz, Mr. H. W. Clothier, Mr. H. W. Miller, and members of the staff at the New Town Works, where they were able to see a practical demonstration of the company's very thoroughly organised system of production. The party then proceeded to the Old Town Works, where specimens of Messrs. Reyrolle's well-known apparatus were inspected, amongst which was switchgear for mining and industrial service, together with sub-station, power-station, and super-power station panels. A very interesting programme of experiments was arranged in the laboratory, and high-voltage phenomena produced by a 450,000-V testing transformer were much appreciated. The visitors were entertained to tea by the company, and Mr. Chas. Day, on behalf of the Institution, in the course of his remarks, commented specially upon the fine layout of the equipment of Messrs. Reyrolle's works.

Institution of Public Lighting Engineers.—The second annual general meeting will be held at Leeds on September 14th to 16th, 1925, under the presidency of Mr. S. B. Langlands, J.P., and the new president, Mr. C. S. Shapley. One of the papers to be read is entitled "Electric Street Lighting in Rural Areas," by Mr. E. C. Lennox, of the Newcastle-on-Tyne Electric Supply Co., Ltd. The hon. secretary, Capt. W. J. Liberty, Guildhall, London, has received the implied sanction of the Ministry of Health for the payment of the expenses of delegates to the meeting by local authorities. Full particulars can be obtained from Capt. Liberty.

Our Personal Column.

(Electrical men are invited to enable us to keep readers of the "Electrical Review" posted concerning their movements).

At the recent Convention at San Francisco, Mr. JAMES E. DAVIDSON, vice-president and general manager of the Nebraska Power Co., was elected president of the National Electric Light Association.

A meeting of representatives of the South-East Lancashire Electricity Advisory Board, and undertakings in the North-West Midlands area, took place at the Manchester Town Hall on July 7th, in order to make a presentation to Mr. S. L. PEARCE, who is relinquishing the office of chief electrical engineer of the Manchester municipal electricity undertaking to become an Electricity Commissioner. The presentation took the form of a mahogany writing table and a chair to match. The top of the table bore a silver plate on which the following inscription was engraved:—"This desk was presented to S. L. PEARCE, Esq., C.B.E. M.Sc.Tech., as a mark of professional and personal esteem, on the occasion of his appointment to the Electricity Commission, by the constituent authorities of the South-East Lancashire Electricity Advisory Board and the authorised undertakers in the North-Western area, in appreciation of his services to such board and his conciliation work for the industry. 7th July, 1925." Alderman W. T. Dagnall, chairman of the Advisory Board, in making the presentation, spoke of Mr. Pearce's work in connection with the technical development of the area and especially in the formation of the Board and its predecessors. Alderman Dagnall said that Mr. Pearce occupied the chair of the Engineering Advisory Committee of the Board not by virtue of his being the the chief engineer of the largest undertaking in the area, but on account of his professional and personal qualities and his reputation for fairness and impartiality. He regretted that they were losing Mr. Pearce, but they wished him happiness and success in his new and wider sphere of usefulness. Alderman Higham, chairman of the employers' side of the District Joint Industrial Council for the area, supported Alderman Dagnall's appreciation and referred to Mr. Pearce's conciliation work. Alderman Clark, chairman of the employers' side of the District Joint Board, also testified to Mr. Pearce's important part in the technical and conciliation work of the area. In replying, Mr. Pearce said that the technical success with which he had been credited had only been achieved with the loyal and unstinted help always received from his colleagues. He thought that the Board had accomplished a great deal of useful work in the realisation of the spirit of the Electricity (Supply) Act of 1919. He asked those present to believe that the qualities of fairness which they had kindly attributed to him would always be fully exercised in the carrying out of his new duties. After briefly mentioning the activities of the Joint Board and Industrial Council, Mr. Pearce concluded by thanking the chairman for the writing table and chair, expressing the hope that he would not lose touch with those with whom he had worked so long.

Mr. H. C. HAMBRO has joined the board of the Eastern Telegraph Co., Ltd.

Mr. LESLIE C. SHARP, son of Mr. Ernest E. Sharp, will on Monday next, 20th inst., join his father in the business of Venner Time Switches, Ltd. For some years past he has been securing practical experience in certain branches of electrical manufacturing work and in central electricity supply station work, which should stand him in good stead in devoting his attentions to the outside work of the above company.

The Chesterfield Electricity Committee has appointed Mr. S. H. FOWLES, technical assistant at the electricity works, as station superintendent, and Mr. G. H. DAVIES as assistant station superintendent and relief shift engineer.

The marriage took place at All Saints' Church, Benhilton, Sutton, Surrey, on June 27th, of Mr. LEONARD H. SHORT, M.C., of the English Electric Co., and Miss GLADYS BOX.

Mr. D. MACLENNAN manager of the Alloa electricity works, who has been appointed manager of the Inverness Corporation electricity works has been presented with a Westminster chiming clock by the Alloa Town Council in appreciation of his services during the past five years.

The Keighley Corporation Tramways Committee, after interviewing five out of the 67 applicants for the post of manager of the Tramways Department, has recommended the appointment of Mr. RONALD A. FEARNLEY, chief assistant engineer to the Sheffield Corporation Tramways and Motor-bus Department, and son of the manager of the Sheffield Tramways.

The marriage took place on July 11th at All Souls, Langham Place, London, of Mr. FRANK A. NEWINGTON, of Bircholme, Hawkhurst, Kent, to Janie, only daughter of the late Dr. and Mrs. Ross Watt, Arnisfield, Ayr.

Modern Transport states that the directors of the Southern Railway have appointed Mr. A. Raworth electrical engineer for new works and to co-operate with Mr. Herbert Jones, the company's electrical engineer, with regard to the preparation of electrification schemes. Mr. Raworth, prior to grouping, was electrical engineer of the former South-Eastern and Chatham Railway, and as engineer of the South-Eastern and Chatham Construction and Power Company (a subsidiary company formed to carry out the electrification of the company's suburban lines) he has been responsible for the designs and execution of the scheme, the first three sections of which were formally opened to electric traction on July 12th.

Hove Town Council has appointed Mr. ALAN PROPERT assistant engineer at the Corporation electricity works.

Mr. A. M. SAMUEL, M.P., Parliamentary Secretary of the Department of Overseas Trade, has appointed SIR RICHARD REDMAYNE K.C.B., formerly chairman of the Imperial Mineral Resources Bureau, which has now been amalgamated with the Imperial Institute, to be Director of the Imperial Institute for a short period in order that he may supervise the amalgamation of the two bodies.

The Worcester City Council has granted extended leave (six weeks, in August and September) to Mr. C. W. SHAW, the city electrical engineer, to enable him to visit the United States at the invitation of the President of the Detroit Edison Electric Supply Co. The Council at the same meeting approved of the proposal to increase Mr. Shaw's salary from £800 to £1,000 per annum in fulfilment of a pledge that the question of his remuneration should be considered when the Order giving the Corporation powers over a larger area, was through.

The Harrogate Electricity Committee on Monday recommended the Council to increase the salary of Mr. GEORGE WILKINSON, the borough electrical engineer, by £150 per annum to £950 on condition that he gives up all private practice and consulting work.

The Wolverhampton Town Council on Monday decided to increase the salary of the tramway manager (Mr. OWEN SILVERS) from £850 to £950 per annum.

As was briefly announced in our last issue Dr. T. F. WALL has been appointed head of the Electrical Engineering Department of Sheffield University. Dr. Wall was educated at the Liverpool Grammar School and Liverpool University College. He graduated in the Honours School of Engineering in the Victoria University of Manchester. He was special research scholar in electrical engineering in the then newly-established University of Liverpool and was subsequently elected to the "1851 Exhibition Scholarship," which he held for two years in the Elektrotechnisches Institut, Karlsruhe, Germany, where he was engaged on research work in the laboratories of the late Dr. Englebert Arnold. In 1912 the degree of Doctor of Science was conferred on him by the Victoria University of

Manchester, and in 1914 the degree of Doctor of Engineering by the University of Liverpool, for research work in electrical engineering. He served as an apprentice in the shops and drawing office of Messrs. Boothroyd, Hyslop & Co., Bootle, mechanical and electrical engineers, and subsequently acted as electrical designer to that firm. He was then engaged as an electrical designer with Siemens Brothers Dynamo Works, Ltd., Stafford. For several years he was lecturer and organising supervisor of the electrical engineering laboratories in the University of Birmingham under the late Prof. Gisbert Kapp. During the war he held a commission as lieutenant in the Royal Naval Volunteer Reserve and was particularly engaged on the development of electrical apparatus which he had invented for signalling to submerged submarines and for which an award was made by the Admiralty Council. The Admiralty has subsequently acquired several patents of his relative to applications of electricity for naval purposes. He has contributed a large number of original communications to the leading technical journals and to the British Association—in particular, the outline of a proposal for the long-distance transmission of electrical energy in connection with the Severn barrage scheme. In the year 1921 Messrs. Methuen published his book on "Electrical Engineering." Dr. Wall has been external examiner in electrical engineering to Queen's University, Belfast, and local examiner in the Midlands for the Institution of Mining Electrical Engineers. He is a member of the local committee of the Institution of Electrical Engineers, and an Associate Member of the Institutions of Civil and Electrical Engineers. Since going to Sheffield University, Dr. Wall has been responsible for the design and equipment of the "Edgar Allen Research Laboratory," in which a large amount of research work has been carried out and extensive investigations of a fundamental nature are now in progress.

Dr. T. F. Wall,
Head of the Electrical Engineering Department, Sheffield University.

Mr. Guy Burney, managing director of the Sterling Telephone & Electric Co., Ltd., informs us that he has decided to retire from that business, and at the end of this month will go to France for a holiday. He has no further plans, but if, after a long rest, he undertakes any other commercial venture, it will be of a less strenuous character. Mr. Burney founded the business in 1900, as a branch of the Berliner Telephone Mfg. Co., of Hanover, and in collaboration with that company's engineers, introduced the "Era" telephone, which, he claims was the first commercial multiple automatic interphone to be put on the market; it was this apparatus that brought the company into prominence. In 1909 works were acquired at Dagenham, and the business, which continued to expand rapidly, was converted into a private limited liability company. On the outbreak of war Mr. Burney offered the works *en bloc* to the War Office and Admiralty for use in any capacity; the offer was not accepted, but the company carried out large contracts for the Government departments and at the end of the war was employing 2,200 people day and night on the production of fuses and field telephones. Mr. Burney received the thanks of the War Office, Air Ministry, and Ministry of Munitions for his services. At an early stage in the war the German shareholding was acquired by British investors, through the Public Trustee. The Dagenham works now cover 12 acres, and are engaged in the production of Post Office and domestic telephones, and wireless apparatus, employing 2,600 people in the busy season.

Mr. Burney was founder and first chairman of the Telephone Manufacturers' Association and of the National Association of Radio Manufacturers, and is a member of the P.M.G.'s Advisory Committee on broadcasting. He took an active interest in labour problems during the war, and has always provided for the comfort and welfare of the workers, including the athletic and social side. In business his slogan was "Aim high!" and his policy progressive, demanding a high standard of quality in the products of his company, the success of which has been largely due to the energy and ability with which he has conducted its affairs and the foresight which enabled him to anticipate and provide for the requirements of the market.

Mr. Guy Burney,
Founder and managing director of Sterling Telephone and Electric Co., Ltd.

Mr. Harold Hobson, who has been appointed joint manager of the County of London Electric Supply Co., Ltd., and whose portrait accompanies this note, was educated at King's College, London, where he took the degree of B.Sc. (Engineering).

Elliott & Fry **Mr. Harold Hobson,** *[London.*
Joint manager of the County of London Electric Supply Co., Ltd.

His practical training was received at the Rugby works of the British Thomson-Houston Co., Ltd., and elsewhere. In 1914 he became assistant engineer at the Darlington office of Messrs. Merz & McLellan, and later went to their Middlesbrough office. In 1920 he became personal assistant in London to one of the partners of the firm, and recently he has occupied the position of engineer-in-charge of the construction of the Barking station and other work for the County of London Co.

Mr. H. C. LAMB, the new chief of the Manchester electricity undertaking, has been elected to the employers' side of the No. 3 District Council (North-Western Area) Electricity Supply industry, in succession to Mr. S. L. Pearce.

Obituary.—MR. JOERGENSEN.—A *Reuter* dispatch from Helsingfors states that on July 9th, while Mr. Joergensen, the manager of the Great Northern Telegraph Company in Finland, was sailing in his yacht near Nystad the yacht was struck by lightning. All those on board were killed, with the exception of one of Mr. Joergensen's daughters.

MR. S. DEAN.—Mr. Samuel Dean, who was the first electrician to be appointed by Lever Bros., Port Sunlight, whom he served 34 years, died at Port Sunlight last week at the age of 60.

Wills.—The late Major FREDERICK COUTTS, general manager of the Yorkshire (West Riding) Electric Tramways Co., left £12,670.

Mr. W. A. HARPER, of Harper Bros. & Co., consulting engineers, left £3,843 gross and £2,420 net personalty.

New Companies Registered.

Giljay Patents, Ltd. (207,053).—Private company. Registered July 3rd. Capital, £500 in £1 shares. To acquire and turn to account any patents, rights, *brevets d'invention*, licences, protection, privileges and concessions, and to carry on the business of electricians, electrical and mechanical engineers, &c. The permanent directors are:—N. W. Gilbert, "Aucklands," Lapworth, Warwickshire, electrical engineer; A. E. Jabet, 59, Hazelwood Road, Acocks Green, Birmingham, electrical engineer; J. H. Kitchen, 85, Featherstone Road, King's Heath, Birmingham, solicitor. Solicitor: J. H. Kitchen. Registered office: King's Road, Hay Mills, Birmingham.

Davis, Cash & Co., Ltd. (207,032).—Private company. Registered July 3rd. Capital, £10,000 in 5,000 7½ per cent. cumulative preference and 4,900 ordinary shares of £1 each and 2,000 founders' shares of 1s. each. Objects: To carry on the business of designers and craftsmen in metals and electrical accessories carried on by C. H. Davis and F. T. Cash at 47, Mount Pleasant, London. The directors are:—C. H. Davis (chairman), Bushcroft, Wormley, Hertford; F. T. Cash, Normancroft, Elm Road, Sidcup, Kent (both permanent joint managing directors). Secretary: E. A. Cash. Solicitors: Godwin & Son, 26, Cannon Street, E.C.4. Registered office: 47, Mount Pleasant, Clerkenwell, E.C.1.

Rapinet, Ltd. (207,112).—Private company. Registered July 6th. Capital, £1,000 in £1 shares. Objects: To carry on the business of manufacturers of wireless instruments and accessories, &c. The directors are:—D. J. Phillips, "San Marino," Upper Tooting Park, S.W.17; H. P. Rapinet, 19, Westbourne Terrace Road, W.2. Qualification, 1 share. Remuneration, £150 each per annum. Registered office: 39-47, Groton Road, Earlsfield, S.W.18.

Power Development Co., Ltd. (207,12).—Registered as a private company on July 6th, with a nominal capital of £22,000 in 20,000 preference shares of £1 and 40,000 ordinary shares of 1s. The preference shares confer the right to a fixed cumulative preferential dividend of 6 per cent., and in a winding up to have the assets available for distribution applied first in paying off capital and arrears of dividend, but do not confer any further right to participation in profits or assets. Objects: To form, promote, subsidise and assist companies, syndicates, and partnerships, to carry on or carrying on all or any of the businesses of electrical and general engineers, and manufacturers and maintainers of plant for the generation, accumulation, transmission, and supply of electrical energy for the purposes of light, heat, power or otherwise; to carry on business as bankers, capitalists, financiers, concessionnaires and merchants, &c. The subscribers (each with one preference share) are:—J. S. Mellor, Kennans House, Crown Court, Cheapside, E.C.2, solicitor; H. R. Turner, Kennans House, Crown Court, Cheapside, E.C.2. The first directors are to be appointed by the subscribers. Qualification, 500 preference or ordinary shares. Remuneration as fixed by the company. Solicitors: Wild, Collins & Crosse, Kennans House, Crown Court, Cheapside, E.C.2. Registered office: 6, Old Jewry, E.C.

New Wireless League, Ltd. (207,185).—Private company. Registered July 10th. Capital, £100 in £1 shares. To look after the interests that may arise (legal or otherwise) of the members of the company, to formulate an insurance scheme, and to act in any other way that may seem beneficial to the directors on behalf of the members, &c. The first directors are:—W. A. McAlonan, 16, Elm Park Road, Winchmore Hill, N.21, publisher; W. B. Cooper, 64, Clarendon Road, Walthamstow, advertising manager; J. M. Grey, 26, Palmerston Road, Westcliff-on-Sea, publisher. Qualification, 10 shares. Solicitors: Firth & Co., 5, Chancery Lane, W.C.2. Registered office: Astor House, Aldwych, W.C.2.

Woodfyt Sales, Ltd. (207,152).—Private company. Registered July 8th. Capital, £2,550 in £1 shares. Objects: To carry on business as selling agents primarily supplied by Woodfyt Manufacturing Co., Ltd., to act as agents for other companies or persons interested in electrical furnishing equipment or in furniture and fittings of any other description, &c. The directors are:—C. G. North, 22, Blagdon Road, New Malden, wood work manufacturer (permanent); Charles Abbotts Smith, 12, Selwood Road, Addiscombe, sales manager; Charles Allin Smith, 12, Selwood Road, Addiscombe, company secretary. Qualification, £50. Solicitor: N. E. Carey, 2, Verulam Buildings, Gray's Inn, W.C.1. Registered office: 8, Diana Place, Euston Road, N.W.

Electrical Sunlight and Bergonie Co., Ltd. (207,154).—Private company. Registered July 9th. Capital, £750 in £1 shares. Objects: To acquire the business of an electro-therapeutic institute carried on by Mabel C. Collins at 2, Seaford Court, Great Portland Street, W., and to carry on business as an institute for the treatment of disorders and diseases by electricity, electric, or other scientific lights or rays in all their applications, and such other treatment of an electrical, medicinal or other nature as may be prescribed by qualified medical men and under their supervision, &c. The directors are:—E. F. Pratt, M.D., 15, Clarges Street, W., permanent chairman and managing director; Mrs. E. E. Rechnitzer, 35, Charles Street, W. Qualification, £100. Remuneration as fixed by the company. Secretary: Mrs. M. E. R. Fisher, 10a, Castleton Road, West Kensington, W. Solicitors: John T. Lewis & Woods, 54, Chancery Lane, W.C. Registered office: 54, Chancery Lane, W.C.

Climax Radio Electric, Ltd. (207,078).—Private company. Registered July 4th. Capital, £5,250 in 5,000 7½ per cent. non-cumulative preference shares of £1 and 5,000 ordinary shares of 1s. Objects: To manufacture, erect, maintain, repair and deal in wireless, telegraphic and telephonic apparatus, valves, instruments, equipment, accessories, electrical, magnetic, scientific and radioactive instruments and apparatus, vehicles and buildings for demonstrating and exhibiting the same, and books and literature relating thereto, &c. The life directors are:—C. H. Stave, 182, Church Street, Kensington, electrical engineer (director of Climax Patents, Ltd.); P. W. Baker, 2, Durlston Road, Kingston, electrical engineer; R. M. Ellis, Chop Cherry, Chinnor, Oxon, electrical engineer (director of Climax Patents, Ltd., and Chellis, Ltd.). Qualification, 100 shares. Registered office: 38, Quill Lane, Putney, S.W.15.

Hawk Coil Co., Ltd. (207,105).—Private company. Registered July 6th. Capital, £1,500 in £1 shares. Objects: To acquire the business of manufacturers of and dealers in wireless specialities and components, &c., carried on at St. Mary's Road, Surbiton, as the Hawk Coil Co., together with all or part of the rights, title, and interest in or appertaining to Patent Office Specifications, No. 20,283, relating to inductance coils, and No. 25,371, relating to wireless receiving apparatus (both 1924), and also the registered trade mark "Hawk," No. 421,325. The directors are:—R. J Coley, 189, Richmond Road, Kingston-on-Thames, engineer; H. J. Rochester, 13, Adelaide Road, Richmond, secretary. Qualification: £5. Secretary: H. J Rochester. Registered office: St. Mary's Road, Surbiton.

Official Returns of Electrical Companies.

Horstman, Ltd. — Mortgage on deeds and documents mentioned in the schedule thereto, premises, plant, machinery, and the company's undertaking and property, present and future, including uncalled capital, dated June 29th, 1925; to secure all moneys due or to become due from the company to Lloyd's Bank, Ltd.

Mersey Power Co., Ltd.—Security, constituting a second charge on the company's undertaking and property, present and future, including uncalled capital, dated June 23rd, 1925, to secure all moneys due or to become due from the company to the Westminster Bank, Ltd., not exceeding £200,000, ranking after first charge dated November 27th, 1918.

Altrincham Electric Supply, Ltd.—Second mortgage debenture dated June 24th, 1925, to secure £100,000 charged on the company's undertaking and property, present and future, including uncalled capital. Holder: Solicitor to H.M. Treasury.

Rose Bros. Electrical Co., Ltd.—Particulars filed of £3,000 debentures authorised July 1st, 1925, charged on the company's undertaking and property, present and future, including uncalled capital, the amount of the present issue being £1,000.

Rushden and District Electric Supply Co., Ltd.—Issue on June 25th, 1925, of £25,000 debentures, part of a series already registered.

Vaughan Crane Co., Ltd.—Satisfaction in full on June 29th, 1925, of mortgage and debenture dated April 17th, 1900, securing £5,000.

Brotherton Ediswan Tubes and Conduits, Ltd.—R. H. Johnston, of 49, Queen Street, Wolverhampton, ceased to act as receiver or manager on June 13th, 1925, in respect of the appointments of June 14th, 1922, and October 16th, 1924.

City Notes.

Reports and Meetings of Electrical Companies; Dividend Results, &c.

General Electric Co., Ltd.

The annual general meeting was held on July 8th at Magnet House, Kingsway, Sir Hugo Hirst, Bt., presiding. In moving the adoption of the report (*vide* ELEC. REV., June 26th, p. 1026) the chairman said that the company had overcome the difficulties caused by the aftermath of the war. They felt some sense of pride that their prevision as to the services which the electrical industry could render had been justified by their expanding business and corresponding results. The profits, which for the first time in their history exceeded the million-pound mark, were nearly £200,000 in excess of those of last year. Those results were not only due to a greater demand for their goods; they reflected also the increasing efficiency of their recent enterprises, but they were mainly due to the comparative industrial calm which they had enjoyed during the last 12 months. The balance sheet showed great improvement. The items freehold land and buildings and fixed plant and machinery remained stationary as, by a coincidence, depreciations and additions equalised. They were able to keep loose plant, fixtures and installations and goodwill and patents at the nominal sum of £1, which was most satisfactory considering the enhancement of the value of the latter owing to the creation of their research laboratories and the generous allocation made to them. The outstanding feature on the credit side of the balance sheet was the disappearance of the item premium on purchase of Fraser & Chalmers, amounting to £110,000, and the item expenses of debenture stock issue amounting to £409,000. Their liquid resources had increased by nearly £600,000, a very considerable amount, but none too big for the opportunities of re-investment which the progress of the electrical industry would demand—certainly none too big whilst they carried the present onerous load of their debenture issue. He hoped that, at not too distant a date, it might be possible to lighten that charge by some means. If things continued as they had every reason to hope they would, the ordinary shareholders would in the long run be rewarded for their restraint but a concern such as theirs, which was assuming great national importance, must first of all fight for absolute safety. They had to realise that they were employing directly approximately 20,000 workers, apart from those engaged in other industries and in distribution. They must realise that in the electrical industry new ideas were constantly being evolved and capital must be available to study and develop them. The value to the community at large of a company like theirs showed itself in other directions. The quality of its productions was mainly based on home raw material and home labour: what they produced did really add substantially to the wealth of the country. Their exports, amounting to several millions, were much more valuable exports than those of much bigger concerns who must, by the nature of their business, rely largely on importation. They had by no means

arrived at the limit of their possibilities. Though the company was formed in 1889 with a capital of £30,000 and had to-day a capital of £9,000,000, he felt that, electrically speaking, they were still only at the beginning of things. The supply of electricity in the London area by some 70 or 80 authorities had involved a capital expenditure of over 30 millions. If the engineers of those authorities were given the chance of a modern lay-out of a big power station, they could, for less than half that capital, give a bigger output at a considerably reduced cost of production. That was just an indication of what would happen sooner or later to 90 per cent. of the existing power stations in the country. They could imagine how reduced cost of production would stimulate the application of electrical apparatus in industrial and private service. There was an enormous scope in the telephone industry, one of the essential means of modern communication. Great Britain was very much behind in this respect. Good reasons could be given for that slow development, but an industrial trading country, such as Great Britain, had no business to be so low down in the scale, and he was glad to know that the Government had realised for some time the need for speeding up a big development programme. The company was well equipped to meet the demand for automatic or any other kind of telephone service. A similar state of affairs existed still in the lighting industry. The improvement of lamps and the study of better lighting methods had led to a considerable increase in the use of electric light during the last few years, and he was satisfied that the combined efforts of the industry to educate the public in the proper use of lighting, how to light houses, shops, streets and factories, would mean a considerable growth of that industry in which they held an important place. Similar pictures could be painted of every other branch of the electrical industry—domestic or industrial. Last year he dwelt on their hopes of what railway electrification, ship propulsion, &c., had in store for them. But of course it was impossible to expect continued prosperity of one industry, however qualified that industry might be for progress, if the rest of the country was ailing. It would be wrong not to admit that this country was suffering from many ailments. Unless we worked as hard as other nations and as efficiently, we must drift farther back. Our prosperity depended upon the possibility of a big export. The recent investigation which his colleague, Mr. Railing, and he had made of working conditions on the Continent, satisfied them that most industries in most Continental countries worked up to 55 hours and more. Whilst there was such a tremendous difference in the working hours of our people compared with the foreigner, our greater skill and efficiency could not make up the difference: we must realise that we must meet the situation in this direction somehow, particularly in the basic industries of coal, steel and iron on which almost every other industry depended. Even, however, if we settled all our difficulties, even if we worked as long as the foreigner, he still felt that the power of production was too great for the absorbing power of the world at the present moment. The great needs of the war developed the power of production of each country to at least double what it required: if wild competition between countries was allowed to go on unchecked, it would lead to political difficulties and to great industrial crises, first in the weaker countries, but eventually to the detriment of all, and particularly to the detriment of the wage earners. He could not but feel that the big industries of the principal countries would have to put their heads together in a spirit of collaboration rather than in a spirit of the "survival of the fittest." They would have to discuss standardisation, working conditions and sharing of markets. Only by such collaboration could industrial steadiness gradually be obtained, and the steady recovery of the world be helped. Mr. E. G. Byng seconded the motion, which was carried without discussion.

Crompton and Co., Ltd.

The annual general meeting was held on July 9th, Mr. A. A. Campbell Swinton, F.R.S., presiding. In proposing the adoption of the report (*vide* our last issue, p.'69), the chairman said that last year they were only able to show a small profit amounting to £1,713, after paying debenture interest, &c. This year they showed a profit of £20,316, which although not entirely satisfactory was a distinct improvement. During the year their turnover had increased, but on the whole at lower prices. Competition, particularly in the export trade, was making it difficult to secure business at remunerative figures, and he saw little prospect of getting satisfactory prices until trade conditions abroad improved generally. There were distinct signs of improvement in the case of one of the most important of their overseas connections. With regard to the home trade the depression in the colliery, iron and steel, and shipbuilding industries naturally had an adverse affect on other trades and they could hardly look for an all-round improvement until the position of those important industries changed for the better. Another very important factor influencing the trade of the country was the high cost of living and high wages paid, particularly to unskilled labour in protected trades. A reduction in those two items, which were interdependent was very necessary. High wages and a high cost of living were just as much a disadvantage to the working classes as they were to the trading community. They commenced the current year with very nearly the same volume of orders in hand as they had at the commencement of last year. He hesitated to express any opinion as to the probable profits for the current year, as so much depended upon their output, which in turn depended upon the volume of orders that they might be able to secure. That part of their works at Chelmsford which before the war was used for the manufacture of arc lamps was fully employed while the war lasted on orders for searchlights for the Government. When peace was declared they were faced with the difficulty of finding remunerative work to fill the shop. He was glad to say that their efforts in that direction had met with success and at the present time the whole shop was occupied in the manufacture of instruments, switchgear of all descriptions, small motors, &c., and they were actually employing more men than they had ever employed before. Although in some cases the prices obtained for the goods manufactured there were not all they could desire, they would appreciate that when the shop was occupied to its full capacity their costs automatically came down, with a corresponding rise in their percentage of profits. In their main shop they were at present unable to obtain as many orders as they wanted for standard industrial motors. The company's patent auto-synchronous motor, which was of particular interest to station engineers desirous of improving their load factor, had met with a good deal of success and they were receiving many repeat orders for it. The board would have liked to have been able to recommend a dividend on the ordinary shares, but after careful consideration it had been thought wiser to adopt a conservative policy and carry the balance forward.

Victoria Falls and Transvaal Power Co., Ltd.

The report for the year ended December 31st, 1924, states that after providing for debenture interest and premium (£145,268) and depreciation and income tax (£382,423), there remains a net profit of £349,853; to this is added £105,094 brought forward, making £454,947. Preference dividends totalling 10 per cent. for the year have been paid and the ordinary shares have received a total of 12½ per cent.; £50,000 is transferred to reserve; and the balance (£117,657) is carried forward. At the close of the year the share capital amounted to £3,000,000, and the debentures outstanding to £2,264,190, a total of £95,480 having been redeemed during the year. A dividend of 3 per cent. has been declared on the preference shares in respect of the first half of the current year. Meeting, July 23rd.

Fuller's United Electric Works, Ltd.

The net trading profit for the year ended March 31st last was £31,027, to this was added £1,495 brought forward, making £32,522. Provision is made for debenture interest, depreciation, reconstruction costs, and doubtful debts and a balance of £2,602 is carried forward. The last accounts covered a period of 14 months and showed a net profit of £19,109. The report shows that in spite of the prevailing bad trade conditions the company's trading increased by a third. The company has extended its operations owing to the carrying out of the important developments foreshadowed in the last report; these developments are expected to continue on a satisfactory basis.

French Companies.

The *Compagnie pour l'Exploitation en France des Téléphones Automatiques* reports a loss for 1924.

The *Compagnie d'Electricité Industrielle*, of Paris, while recording a large increase in the turnover in 1924, reports a loss for the year.

The *Ateliers de Constructions Electriques de Lyon et du Dauphine* reports an increase of 35 per cent. in the turnover in 1924 and a further advance has taken place in the current year. The accounts, however, show a loss on working in 1924.

The report of the *Compagnie Française Thomson-Houston*, which has carried forward the balance of net profits earned last year, states that 1924 witnessed the completion of the programme entered upon in 1919 for the regrouping of the works and the establishment of new works. While the first half of 1924 was characterised by progress in all branches, the State Treasury crisis and the crisis in the paper security market suddenly caused a suspension of the large schemes which had been marked for immediate execution. The shops producing plant for the railway electrification were the principal sufferers from this situation. Notwithstanding this, a considerable stream of work was maintained, and the orders booked since the beginning of 1925 represent an increase of 25 per cent. over those in the corresponding period of 1924. But the industry could not hope to progress in the near future unless its chief customers were able to procure the necessary capital. With this object the company had participated in the constitution of the Société Financière pour le Developpement de l'Electricité en France, which had since received applications representing over 300,000,000 fr. It had also been considered necessary to extend the services which were entrusted with the development of the export trade, and the telephone business had been transferred to a special company.

The *Compagnie Française des Câbles Télégraphiques* reports an increase in net profits from 5,445,000 fr. in 1923 to 6,036,000 fr. last year. It is proposed to raise the rate of distribution on the ordinary shares from 24.95 fr. per share to 26.71 fr. per share.

La Société d'Eclairage et de Force par l'Electricité, of Paris, reports a net profit of 2,118,711 fr. for the last financial year, as compared with 1,397,086 fr. in 1923.

Belgian Companies.

The *Société Intercommunale Belge d'Electricité*, of Brussels, is increasing its capital to the extent of 35,000,000 fr., and has invited applications from existing shareholders for 70,000 new shares of 500 fr. each, at 700 fr. each.

La Société de l'Electricité du Bassin de Charleroi is increasing its capital from 14 to 15 million fr.

German Companies.

The *Prometheus Electric Heating Apparatus Company*, of Frankfort-on-Main, which is associated with the Voigt and Haeffner Company, has carried forward net profits of 20,000 marks earned in 1924. Export prices last year resulted in a loss, and efforts to adapt the export prices to the costs of production have led to a complete stagnation in the foreign trade.

The *North German Cable Works Company*, of Berlin, states that the degree of activity in the second half of 1924 was favourable. Out of the net profits of 100,000 marks it is intended to pay a dividend at the rate of 5 per cent. on the share capital of 1,750,000 marks. The present course of business is stated to be favourable.

The *C. Lorenz Telephone and Telegraph Works Company*, of Berlin, reports that home orders were satisfactory last year, but export orders were scarce. Contracts for automatic telephone stations were entered into with the Reich authorities and orders were booked for radio transmitting stations, but business in receiving apparatus was difficult owing to competition. It is proposed to pay a dividend at the rate of 4 per cent. out of net profits of 788,000 marks on share capital of 6,270,000 marks.

The *High-Frequency Machine Co.*, of Berlin, states that, as compared with a liquidation value of 2,600,000 marks of the holding of Marconi shares the Reich Government has paid 1,117 marks as compensation, and the total amount of the compensation obtainable has been put by the Ministry of Finance at 16,000 marks. The comparatively small claims on America have not yet been settled. A dividend at the rate of 4 per cent. has been declared out of net profits of 86,000 marks for 1924.

The *Saxony Light and Power Works Co.*, of Dresden, states that the dullness of business in the first half of 1924 led to severe competition and frequently inadequate prices. It was only in the second half that conditions improved. After writing off 651,000 marks for depreciation, a dividend at the rate of 7 per cent. has been declared on the preference shares.

The *Baden Electricity Company*, of Mannheim, reports that orders were unsatisfactory in 1924, large constructional contracts frequently failing to mature owing to the impossibility of prospective customers to finance them. The small profits earned last year have been carried forward. An improvement in the orders booked has taken place this year, affording occupation for a long time forward.

The *Robert Bosch Company*, of Stuttgart, reports a considerable increase in the turnover last year; the diminution in the home trade was compensated for by an increase in the exports. The turnover of the companies representing the German company in England and the United States further improved; altogether the company now has 21 sales houses abroad. The accounts record a net profit of 7 940,000 marks and the dividend is at the rate of 8 per cent. for 1924.

Austrian Companies.

The *A.E.G.-Union Electricity Company*, of Vienna, states that development in 1924 was hindered by the general economic situation and by a two months' stoppage through a strike. The export trade was hampered by the isolation measures of the Succession States, but despite this fact the turnover rose to the level of the best pre-war year, the home sales compensating for the deficiency in the exports. The paper net profits allow of the payment of a dividend at the rate of 4,000 crowns per share as in the previous year.

The report of the *Felten and Guilleaume Company*, of Vienna, states that a slight improvement took place in the home sales in 1924, but the export trade declined, oversea deliveries in particular having been difficult to carry out since the end of the crisis in the Ruhr. The net profits permit of an increase in the rate of dividend from 15,000 paper crowns per share in 1923 to 20,000 crowns last year. As to the present year it is stated that the not too favourable prospects manifested at the beginning have now changed for the better.

The *A.E.G. Union Electricitäts Gesellschaft*, of Vienna, reports a net profit of 8,774 million crowns for the last financial year, as compared with 8,219 million crowns in 1923. It is stated that the company has negotiated a loan of 1½ million dollars with an American financial group to bear interest at 7½ per cent. per annum and to be repaid within 20 years.

British Broadcasting Co., Ltd.—The second annual report of this company shows that the amount received in respect of licence fees during the year ended March 31st last was £488,881. In the last accounts, covering a period of 15 months, the amount was only £176,934. After allocating £10,000 to the staff provident fund and reserving £28,400 for taxation, there was a profit of £84,857. The maximum dividend (7½ per cent.) is paid, and a balance of £79,685 is carried forward. It is stated that the surplus is only a "paper" one, as about £59,000 has already been utilised in the construction and improvement of stations. The meeting was to be held yesterday (Thursday).

Altrincham Electric Supply, Ltd.—The report for the year ended December 31st, 1924, records net profits of £23,348. The balance, after deducting directors' fees and preference dividends, was £19,939. It was proposed to transfer £14,000 to reserve and to pay dividends of 7½ per cent. on the ordinary shares and 5s. per share on the deferred shares, as in the previous year.

Petters, Ltd.—Out of the net profit of £30,884 for the past year (including £5,797 brought forward) it is proposed to pay the preference dividend for a further six months, leaving it three years in arrear. The reserve fund receives £20,000 and £24,908 is carried forward. The report states that the improvement in the company's position is continuing. A meeting is to be held on July 23rd for the purpose of considering proposals for the issue of funding certificates to the preference shareholders in satisfaction of the arrears of dividend, amounting to £45,000.

Stock Exchange Notices.—Dealings in the following have been specially allowed by the Committee under Rule 159:—

Adelaide Electric Supply Co.—181,322 six and a-half per cent. "C" cumulative preference shares of £1 each, fully paid, Nos. 68,679 to 250,000.

County of London Electric Supply Co.—826,500 new six per cent. cumulative preference shares of £1 each, issued at £1 0s. 6d. per share, fully paid, Nos. 2,725,001 to 3,551,500 (conversion shares); 1,173,500 new six per cent. cumulative preference shares of £1 each, issued at £1 0s. 6d. per share, partly paid and fully paid, Nos. 3,551,601 to 4,725,000 (instalment shares).

Rees Roturbo Manufacturing Co., Ltd.—The accounts for the year ended September 30th, 1924, show a loss of £1,922 after crediting £582 brought forward and £10,000 from reserve. It is stated that the severe competition in home and foreign markets has resulted in an insufficient volume of orders, and the acceptance of orders at unremunerative prices.

Associated Gas and Electric Co.—A preliminary statement of the results for the year 1924-25, combining the Associated and Manila undertakings, shows a gross revenue of $11,428,461 and net earnings of $4,749,908. After meeting fixed charges, and preferred dividends amounting to $345,698, there remains a balance of $1,738,544 for allocations to reserves and for classes A and B dividends and surplus.

Sligo Lighting and Electric Power Co.—The report for 1924 shows a loss of £800. After providing for preference interest at 4½ per cent. out of a balance from previous account, £1,101 remained at credit of profit and loss and a dividend at the rate of 5 per cent. per annum is recommended on the ordinary shares, leaving £741 to be carried forward.

Greenwood & Batley, Ltd.—The report for the year ended March 31st last records a net profit of £30,679 as compared with £30,237 in 1923-24. Of this amount £6,000 is allocated to depreciation and after the payment of a final ordinary dividend of 2½ per cent. (making 5 per cent. for the year as in the previous year), £15,502 is carried forward. Meeting, July 22nd.

Czecho-Slovakian Companies.—The *Prague Accumulator Co.* is increasing its capital from 6 000,000 to 7,500,000 crowns.

The "*Telegrafia*" *Co.*, of Prague, manufacturers of telegraphic and telephonic apparatus, has declared a dividend of 10 per cent. for last year. The net earnings amounted to 2,058,965 crowns, as compared with 1,753,884 crowns in 1923.

Swiss Companies.—The directors of *Brown, Boveri & Co.*, Baden, are recommending a dividend of 6 per cent. for the year ended March 31st last. The *Société d'Electricité Alioth*, of Basle, an affiliated concern, reports a net profit of 352,000 fr. for the last financial year. The dividend is being maintained at 5 per cent. on the capital of 6 million fr.

The *Société Suisse d'Industrie Electrique*, of Glarus, reports a net profit of 2,636,679 fr. for the last financial year, as compared with 1,790,826 fr. in 1923. The dividend is being increased from 6 to 8 per cent.

Dutch East Indian Company.—The *Allgemeene Nederlandsch-Indische Electriciteit Maatschappij*, of Soerabaya, reports a net profit of 1,302,857 guilders for the last financial year, as compared with 1,174,285 guilders in 1923. The dividend is being increased from 11 to 12 per cent. on a capital of 9 million guilders.

Electrolytic Zinc Co. of Australasia.—The *Financial Times* reports that a dividend at the rate of 12 per cent. has been declared on the preference, ordinary, and deferred ordinary shares in respect of the six months ended June 30th.

Bournemouth and Poole Electricity Supply Co., Ltd.—The following interim dividends have been declared:—Preference shares, 2½ per cent.; second preference shares, 3 per cent.; ordinary shares, 4½ per cent.

Greek Company.—The report of the *Compagnie Hellenique d'Electricité*, of Athens, for last year shows a net profit of only 1,420,995 drachmae, as compared with 2,136,650 drachmae in 1923.

Liverpool Overhead Railway, Ltd.—The directors state that they are unable to declare interim dividends on the preference and ordinary shares.

Dublin United Tramways Co., Ltd.—Interim dividends at the rate of 6 per cent. on the preference stock and 4 per cent. on the ordinary stock have been declared, as in 1924.

Smithfield Markets Electric Supply Co., Ltd.—An interim dividend of 3 per cent. has been declared on the ordinary shares.

Marconi International Marine Communication Co., Ltd.—It is proposed to pay a final dividend of 2½ per cent., making 7½ per cent. for the past year.

Clontarf and Hill of Howth Tramroad Co.—An interim dividend of 3s. per share has been declared, as in 1924.

Stocks and Shares.

MONDAY EVENING.

THE rubber boom is the feature of the Stock Exchange markets at the present time. All departments are subservient to the one popular market in which thousands of people are taking an interest. Stocks and shares in other investments are being sold in order that their possessors may engage in the rubber excitement. Those who are called upon to deal with the business in rubber shares find their energies taxed to the physical utmost in order to keep pace with the demands made upon them. The crisis that has developed in the mining and the railway industries has the effect of causing restraint upon business in the shares of companies connected either nearly or remotely with those two branches of trade.

The War Loan keeps steadily at about 100 and sets the tone to purely investment securities. The recent torrent of new issues which threatened the prices of sound securities, and brought about a moderate fall in many gilt-edged stocks, has been stayed, and the floating supply is being taken by the permanent investor, with the result that prices show a faint tendency to improve. However, there is talk of a renewal of the new issue plethora in the near future, before the holiday season starts in real earnest.

Electricity supply shares are disposed to be dull; it is argued that the industry stands to be unfavourably affected by the disputes in the coal and railway worlds alike. City Lights are a trifle easier, and several other shares show moderate declines. Bournemouth and Poole rose to 56s. 3d., and County of London Electric recovered to 53s. Allotment letters in respect of the new County preference came out this week. The shares were heavily over-subscribed, and the price opened at a small premium over and above the 20s. 6d. at which they were offered. Shareholders received preferential treatment in an allotment conducted upon very just and reasonable lines. In such matters, however, all experience teaches that to please everybody is a sheer impossibility.

Victoria Falls and Transvaal Power ordinary shares have risen to 43s. 6d. on the increase in the dividend to 12½ per cent. The company's annual report seldom errs on the side of diffuseness, and the present document maintains the usual tradition. The figures are, however, decidedly satisfactory, and shareholders will anticipate, with reason, a higher figure for their interests.

Edmundsons' report records a favourable past year, the profits again showing material improvement. The company is building up a strong reserve. While the ordinary shares are unchanged at 23s., the preference have recovered the dividend deducted last week.

The British Broadcasting Co. is going ahead by leaps and bounds. Last year's gross revenue of over half a million sterling was 2½ times greater than that shown by the accounts of the previous fifteen-month period. As the dividend on the cumulative ordinary shares is not allowed to exceed 7½ per cent., the benefit of the surplus goes very largely to the owners of wireless sets. For one thing, nearly £60,000 has been spent during the past year upon the stations, new and less new, and more money is to be laid out in the same way in the year now current. Marconi shares are dullish at 27s. 6d., and Marconi Marines fell, the other day, to 18s. 9d., though the price rallied nominally to £1. The fall led to uneasiness as to what the forthcoming dividend declaration is likely to prove.

Cable stocks are somewhat heavy. Western Telegraphs rose to 16¼, shares being picked up by people who changed into them from Eastern Extensions and Globe ordinary. The dividends upon all these, as upon Eastern ordinary, are 10 per cent., free of tax; duly marked, by the way, in our tables. This serves as a reminder—also by the way—that the indicative asterisk against the Siemens dividend last week must have crept in, may it be charitably supposed, as the result of a printer's error. The last dividend was paid less tax.

Siemens are a few pence lower at 25s. General Electric ordinary, quoted ex-dividend, are 24s. middle. At this price the yield on the money comes to 6¼ per cent., on the basis of the lately-declared 7½ per cent. dividend. At the company's meeting last week, the chairman spoke in vein, prophetically optimistic, of the increasing activities that must lie in front of an industry which he sees is but in its infancy. Sir Hugo Hirst's speech displayed a breadth of vision that will appeal to those who can foresee the extraordinary developments that lie ahead of electrical expansion when it escapes from the parochialism and pettiness that have fretted its energies in the past, and the effect of which still hampers its progress. Brush ordinary went back to 19s. 6d. British Aluminium hardened to 28s. 9d. Callenders are 1/16th off to 2⅛, and Telegraph Constructions at 26½, while quotably 10s. lower, are ex the dividend of 6s. net.

British Columbia Electric deferred and preferred are both 3 points down. Mexican Light preferred shed 2, to 59. Brazilian Tractions at 58 are 1½ higher, and Anglo-Argentine Trams show a firmer tone. In the London traction list, London and Suburban preference fell back to 5s.

Home Rails are heavy and dispirited. Metropolitan Consolidated has gone down to 68½; Underground shilling shares to 7s. Districts at 45½ are ex dividend. The market is weak all round. Investors have been selling their Home Rails in order to buy rubber shares. The exuberance in the market for these latter grew intense. Business has broadened out into boom conditions. People have been speculating in names, and gambling upon the price of the produce. It is all very exhilarating, exhausting, and exciting while it lasts.

The First International Congress of Radiology.

International Units and Standards.

(*Continued from p. 50.*)

DR. SIDNEY RUSS (Middlesex Hospital, London) said that, although it should not be long before they had a system of international units, there appeared to be a little difference of opinion between English and German physicists as to what was most urgently required. At the same time, he was glad there was unanimity of opinion between those in the various countries as to what should really be measured, *viz.*, the ionisation in air, quite apart from any secondary phenomena which might take place. Although a certain result was obtained with a certain beam of X-rays, it was not known what would happen when another beam of X-rays was allowed to enter the same space, although there might be the same ionisation; that was an obvious difficulty which had to be met because, although the same actual ionisation with two wave-lengths was obtained, there would not be the same intensity. Therefore, it was necessary to decide upon some definite wave-length as the standard. Again, great difficulties arose when considering a unit of dosage, and even if that were decided upon, they would still be a very long way from specifying the beams that were being used, assuming that the electrostatic charge was that corresponding to the unit of dosage which had been suggested.

DR. GLASSER (United States) referred to the work that was being done by the Standardisation Committee recently appointed by the Radiological Society of North America, and spoke of the construction of ionisation chambers there for the purpose of standardisation.

PROF. W. FRIEDRICH (Frieberg, Germany) said that whilst it would be an ideal thing, from the absolute point of view, to measure the energy of the X-ray and the energy absorbed by any human tissue, the attempts made to do so had not been very successful. Therefore, he agreed with the proposal to form an International Committee to go into the whole problem of units. Perhaps the adoption of a physical unit would be the simplest from the point of view of the radiologist.

DR. HANS HOLFELDER (Frankfurt), referring to certain differences which had been alleged to exist between the tentative standards adopted in France and Germany, suggested that the experimental work carried out in France relating to the comparison between the two systems might not have been done with sufficient exactitude, and said it would be unwise to draw definite conclusions from only one or two comparative experiments, as seemed to have been the case. There was no evidence that the same quality X-rays had been used in the two cases, for instance. The statement had been made that the French dose was 25 times the German dose, but the experimental work should be carefully checked before that statement was accepted.

PROF. H. HOLTHUSEN (Hamburg) urged the necessity for choosing a unit which could be defined as shortly as possible; that was the reason why German scientists had not seen their way to follow what had been suggested by the French workers some years ago. He doubted whether it would be possible to calibrate ionisation chambers by radium having regard to the fact that the ionisation effect of gamma rays in any given instrument consisted, first, of the ionisation in the chamber itself and also of ionisation in the other parts of the instrument. On the other hand, he agreed with the French that for the purpose of standardisation of apparatus they should adopt a constant source of ray of short wave-length.

PROF. CROWTHER suggested that for the purpose of standardisation they had all that was required, or could be hoped for at present, in the electrostatic unit. He hoped the unit would not be fixed in terms of radium, because the gamma rays of radium were so extraordinarily penetrating that it was impossible to shield the ionisation chamber from the gamma rays sufficiently.

This closed the discussion.

During the meeting of the Physics Section on Friday, July 3rd, the CHAIRMAN (Mr. C. E. S. Phillips), referring to the proposal to form an International Committee to deal with units and standardisation, said that the matter had since been given careful consideration, and a resolution would be placed before the Section, with the approval of Dr. Béclere and Dr. Finzi. In order to make the resolution quite clear, he mentioned that the British X-ray Unit Committee was formed in February, 1923, and had been doing a good deal of hard work. The members of the Committee were Sir William Bragg, F.R.S., Prof. A. W. Porter (Professor of Physics, University College, London), Prof. Sidney Russ (Physicist at the Middlesex Hospital), Dr. E. A. Owen (National Physical Laboratory), Mr. C. E. S. Phillips (Physicist to the Cancer Hospital), and Dr. F. L. Hopwood (Physicist at St. Bartholomew's Hospital).

The resolution was as follows:—

"That in order to give effect to the resolution passed at the joint meeting of the Physics and Radiological Sections on July 1st, the British X-Ray Unit Committee, formed in February, 1923, be requested to communicate directly with the physical and radiological societies of the principal countries throughout the world with a view to the nomination by those societies of representatives to constitute such an International Committee."

The resolution was passed, and subsequently came before the Radiological Section, and was also agreed to.

The Silvanus Thompson Memorial Lecture.

On Wednesday evening, July 1st, the eighth Silvanus Thompson Memorial Lecture was given by M. le Duc de Broglie, one of the most distinguished French physicists. The chair was taken by the President of the Congress, who explained that the lectures had been instituted by the Roentgen Society to perpetuate the memory of the late Prof. Silvanus P. Thompson, the founder and first president of the Society, which was the oldest Society in the world connected with the discovery of X-rays.

The subject of the lecture was "Absorption of X and γ Radiations and the Secondary Radiations which accompany them," and a reference was first made to the difficulty of finding explanations for the different effects of Roentgen and γ-rays. The electromagnetic theory of light, said the author, gave them a picture of wave forms as propagating electric and magnetic forces, and enabled them to understand something of the actions which might be expected when light fell on matter, but the process of these actions still remained very obscure. The interpretation of observed effects was rendered still more difficult by the fact that a given radiation could never be regarded as working alone, but was in almost all cases able to exist owing to the fluorescence of matter. For instance, when they used a beam of X-rays, they produced at the same time in the illuminated substance some softer rays giving a small amount of ultra-violet light and possibly some visible light. Although a great deal of work had been done in this connection, they were only just beginning to obtain and use reliable data for various rays of different hardnesses.

Reviewing some of the properties of X- and γ-rays, the lecturer sketched briefly the general ideas existing at the present time with regard to the electron theory, mentioning the beautiful work of Mr. C. T. R. Wilson, who discovered that the ionisation properties of Roentgen rays were not due to the rays themselves, but due to the secondary β-rays. In this way it had been shown generally that the electrical, physical, and biological effects of X-rays might be mainly due to the secondary electrons. Therefore, one of the first things to study was the direct action of the β-rays. As a matter of fact, recent work in France had shown that it was the β-rays which were responsible for the noxious action of X-rays on microbes and that some microbes were more susceptible to the action of these rays than others. The law of absorption of β-rays, however, was not yet fully understood, and it was a very complicated matter, although recent work had thrown considerable light upon it. They were completely ignorant of what occurred when an atom was absorbing radiation, but experiment had shown that this peculiar phenomenon was subject to the quantum law, and something of the same kind had been suggested in connection with Y-rays. The absorption of Y-rays closely resembled that of X-rays, but there were certain features which enabled an explanation to be given of the differences between the two.

After sketching briefly some of the features of the absorption process in the two cases, the lecturer said it was possible to conceive a trigger effect of radiation on living cells—in addition to the transfer of energy to matter by radiation. At the same time, the β-ray action made it difficult to account for low-frequency radiation, such as infra-red rays, and they could only confess their present ignorance concerning such deep problems. Nevertheless, they must not be discouraged, for the work that was being done was assisting them to make progress, and the joint efforts of bilologists and physicists would, sooner or later, enable a conception to be evolved out of the present obscurity.

The Silvanus Thompson medal was handed to the lecturer at the close, and he was warmly thanked by the President of the Congress and the President of the Roentgen Society, as well as by his audience.

Protection from X-rays.

An interesting discussion took place on July 2nd in the Physics Section on "Protective and Manipulative Methods in Relation to X-rays and Radium."

Dr. G. W. C. KAYE (National Physical Laboratory), who opened the discussion, recalled the unfortunate disasters which occurred to early X-ray workers and the endeavours made to secure protection for radiologists. As the result of the recommendations of the X-ray Protection Committee which was formed in 1921, the standard of protection had been considerably improved during recent years, and it was hoped that the long list of X-ray martyrs would be brought to an end. On February 1st, 1924, the Home Secretary issued an Order under the Workmen's Compensation Act, extending the scope of that Act to those who were injured in their occupation of administering and working with X-rays. Recommendations for the protection of X-ray workers had been drawn up in other countries. The National Physical Laboratory in this country had from the outset worked in conjunction with the X-ray Protection Committee, and the inspection of X-ray departments, from the point of view of conforming with the Committee's recommendations, had been added to the activities of the N.P.L. In the course of this work, naturally, some important points had been brought to light. For instance, with regard to

drawing up regulations, consideration had to be given to the fact that some operators were much more susceptible than others, whilst consideration also had to be given to the size of the department in question, the length of working hours, holidays and so on. Therefore, it was necessary to cater for the individual of least immunity in drafting regulations. Foolhardiness, also, could never be left wholly out of account. The X-ray worker did not always fully appreciate the magnitude of scattered radiation, which was many times the intensity of the primary beam. It was desirable to surround the tube with as much protective material as possible, but where that could not be done, the operator should be situated behind a screen or wall fitted with the necessary protection. The X-ray Protection Committee had laid down certain thicknesses of lead, according to the conditions, but it was essential to test the protective apparatus before use, against leakage. Quite unexpected things had happened through the lack of this precaution. The open bowl form of protection ought not to be used, and it was a pity that it was still being used in some cases, because tests had shown that it was possible to take a radiogram in any part of the room when this apparatus was employed. Again, there must be adequate ventilation of the room in which the operator was working, and generous ventilation was regarded as second only in importance to the actual protection itself, on account of the tendency for the generation of ozone and nitrous fumes. Further, the X-ray department should be in a place where there was plenty of sunshine and fresh air and not, as unfortunately was frequently the case in the early days, in the cellar. The floor area should be large, and any overhead wires should be corona-less, being run in tubes of adequate size. The minimum height for the ceilings of the rooms should be 11 ft. and the minimum height of any conductors 9 ft. Seven working hours per day were recommended by the Protection Committee, with four weeks' holiday a year and Sunday and two half-days per week off. The aim, said Dr. Kaye, should be to make the taking of an X-ray photograph as simple, easy, and innocuous as taking an ordinary photograph.

In the United States there had been three reports dealing with the subject of protection, and the Bureau of Standards had agreed to undertake the standardisation of protective material. Generally, the regulations were similar to those in this country. Much the same applied to Norway and Russia, and he wished to submit a proposal that the Congress should take steps to secure international agreement on the main question of protective measures for X-ray workers. Such a step would have obvious advantages when buying apparatus from abroad.

Dr. E. A. Owen (National Physical Laboratory) gave some details of the measurements made at the N.P.L., of protective materials up to 200,000 volts. He added that probably scattering took place more at the higher voltages, but not a great deal of progress had yet been made in the study of this. With the new form of bulb which Messrs. Philips had brought out, described by Dr. Bouwers, it seemed to him that the protection problem would take quite a different aspect. At the present time very large protective boxes had to be used, with tackle to move them about, but in the case of the new Philips lamps the protection formed part of the bulb, practically speaking, which was ideal. The protection problem should be looked at on the lines of the development of this new tube.

Dr. H. P. Pilon (Paris) urged the necessity for protection against both primary and secondary radiations, and expressed the view that the ordinary enclosure in boxes was unsatisfactory. A brief description was given of a new tube enclosed in a special type of lead-lined box, water or oil cooling being adopted. This tube was capable of working up to 200,000 volts, d.c., and it was claimed that the life of the tube was considerably lengthened in this way. The whole outfit was carried on a small runway and could be brought over the patient at any desired spot or angle, the rays being focused in a manner to prevent secondary radiations.

Dr. Glasser (United States) raised the question whether the protection afforded by lead or lead glass was sufficient. Experiments which he had carried out had shown that rays sometimes came through this material.

Dr. Ferroux (Paris) said that protection from radium rays was well worth consideration.

Dr. V. E. Pullin also emphasised the importance of ventilation in X-ray rooms. X-ray operators had complained of headaches and sickness, and he thought that this was due in some measure to the ionisation of the atmosphere. When forced ventilation was applied these symptoms disappeared. As to running tubes in oil, he had always experienced difficulty in doing this when using rectified a.c. The tubes referred to by Dr. Pilon were for running on d.c.

Dr. H. Moore (London) said he always believed in getting as far away from the X-ray generator and tubes as possible; indeed, he had relied upon that more than upon lead screens.

Dr. Kaye, in a brief reply to the discussion, said his whole object was to unify standards of X-ray protection. He moved that the Congress be asked to take definite steps in this direction in conjunction with other countries. Dr. Pullen seconded the proposal, which was adopted.

Determining the Capacity of X-ray Tubes.

In a paper by Dr. A. Frankel (Berlin), methods for determining the capacity of X-ray tubes were described, and a table was exhibited which enabled the user of X-ray tubes to determine the maximum current which a tube would carry.

Dr. A. Bouwers (Holland) said that every tube maker would thank Dr. Frankel for the work he had done; a table such as he had devised would eliminate all guesswork.

Dr. Morrison (London) also congratulated the author on devising something which would be of real practical use; it should result in tubes lasting much longer than they did at present. At the same time, the reliability of tubes to-day was remarkable; he knew of cases in which 30,000 radiograms had been taken with one tube, and the tube was still working. The Kodak people had provided means for arriving at the accurate exposure, and now the author presented them with a means for preventing damage to the tubes by overcharging. It looked as if X-ray photography would soon be as simple as ordinary snap-shotting.

(To be continued.)

Developing Community Activities.*

Advice to Municipal Electricity Suppliers.

By V. W. DALE.

All community activities, and also the public utility services owned and controlled by municipalities, depend for their creation and maintenance upon a favourably prepared public opinion. In spite of the World Convention last year which assisted considerably to establish advertising as a profession in this country, it still remains a task for the advertising world to overcome the barriers of civic dignity, legislative restriction and an entirely false economy which to-day compel the public to "walk in darkness" so far as many of our costly communal services are concerned. Advertising by municipalities affords a vast potential field for the advertising profession; this particularly applies to electricity supply. During the next few years the public service of electricity will by its own momentum inevitably progress; its influence, in industrial and domestic spheres particularly, will most certainly bring about a beneficent revolution in the lives of men and women. The supply of electricity is *not* so completely a monopoly as it is generally supposed to be because, although a municipality may have a monopoly in the supply of electricity, it is not really *electricity* that the people want, but light, heat, or power, which can be obtained also from other sources. The sooner and more generally that is properly recognised by those in authority the better for the industry.

* Abstract of a paper read before the British Advertising Convention, Harrogate.

Educational Advertising Necessary.

It is absolutely essential that a reasonable proportion of the revenue of the electricity supply undertakings should be devoted to educational advertising. Uninteresting official notices inserted in local papers and unreadable statements on circulars and accounts are not the methods to adopt to get the desired information into the mind of the average member of the public. At the same time it must be borne in mind that public utility advertising must essentially be of an informative character. Vision in these matters must extend beyond the boundaries of the Town Clerk's office; the assistance of the expert commercial artist and the expert copy writer must be enlisted to turn cold statements of fact and information into live "copy"—warm, attractive, bold, appealing and readily understandable. Unless every person of only average intelligence in any particular area is able to grasp the leading particulars of the facilities which his own public utility service offers him, then that body has failed to fulfil its duty to the public to whom it is supposed to be under legal obligation to serve. The need for such scientific advertising can be seen with regard to the price of electricity for lighting and heating. There are few, if any undertakings in this country that do not offer a lower rate for heating than for lighting. Nevertheless, hundreds of people using electricity in Greater London, including journalists and people occupying public positions, are entirely unaware that they can get electricity in their houses at more than one price. This is because the municipalities merely announce, they do not advertise, and as a result the public is condemned to suffer the inconvenience of an incomplete and unsatisfactory service while the revenues of the undertakings are also adversely affected and good business is lost.

The Engineer as Salesman.

Another curious disability against which the commercial velopment of the electricity supply has been obliged to ruggle for many years has actually been the absorbing nature the engineering side of the work. During the early years anagement of the undertakings was very rightly placed in e hands of engineers men who by training and experience id outlook had nothing in common with anything so vulgar "trade." Selling was regarded as unprofessional, and if a ospective consumer required a supply of electricity he was pected to almost beg for it; the industry rarely sought him. day, the position is rapidly changing. The efficiency and liability of electrical plant, improved organisation, increased mpetition (and perhaps also the continuous evolution of an) finds the average central station engineer and manager en to embrace all the arts of selling as a means of getting e best out of the public money invested in his undertaking. he business of supplying electricity is now established on a und economic and scientific basis, and the commercial deve- pment of the undertakings is rapidly coming to engage the ajor portion of the suppliers' attention. At last it is even ing realised by many of the municipal councils and commit- es that those vital and indispensable forces, demand-creating id selling, have got to be exploited very fully if their trading epartments are to be developed.

The industry is awakening, but it has by no means visualised s yet all that is required of it. There are many undertakings erving communities of a million or more people, offering ectricity at rates which reflect the application of the ighest technical and engineering skill and generous financial olicies, affording opportunities for vast and immediate deve- pments, yet these undertakings very often have only a poor ppreciation of the power of publicity. A thoroughly en- ghtened manager is still the servant of his masters, and often nough is powerless to move a lay committee when its interest n communal trading is no wider and no deeper than its de- ire to grasp every penny of profits towards relieving general istrict rates, a short-sighted policy as grossly unbusinesslike s it is unfair and inequitable to the consumer. The only one ing that will induce the people in authority to apply a por- ion of their revenue to educational propaganda work is for dvertising men to show them that sound educational advertis- ig can increase the yield of their undertakings many times ver.

Wide Scope for Development.

The revenue of electricity supply undertakings in this ountry derived from the energy sold last year was of the order f £33,000,000, representing only about one-halfpenny per ead of population per day. These figures confirm the wonder- ul scope for expansion. There is a tremendous field for de- elopment in the 10,000,000 to 11,000,000 houses in these islands ven dealing with domestic applications only. Less than 12 er cent. of these houses are wired or using electricity at resent for any purpose at all. Yet the public service of elec- ricity is already available to 74 per cent. of the population. t is an absolute obligation devolving upon municipalities own- ng and controlling this important public service to utilise the ress, the hoardings, exhibitions, and other effective channels f publicity in order to educate and encourage the people to se this service upon which they have already raised and spent nore than £300,000,000.

It must be remembered that the conditions obtaining in one upply undertaking sometimes vary widely from those obtain- ng in another; each separate case will demand careful study nd investigation. Costly advertisements can only be effective hen their appeal is supported by reasonable economic charges, he existence of adequate distribution systems, easy facilities or wiring, &c., and for some classes of apparatus hiring and ire-purchase schemes, maintenance of showrooms and a eneral disposition to take load-building seriously and provide n all-round public service. Electricity undertakings should pend on advertising and publicity not less than 2 per cent. of heir revenue. Last year the revenue derived from electricity upply in this country was £33,000,000; this would have pro- vided over £600,000 for advertising, but it is doubtful whether the industry spent £60,000.

There is also a vast field for co-operative effort by a cor- porate body engaging itself in fertilising the soil in preparation for the coming harvest—educating the public concerning the vailability and use of various electrical appliances; enlighten- ing the people by educational propaganda concerning the eco- nomics of production and fair prices; attacking ignorance, re- moving fear, suspicion and apprehension, which still hinder development to an extraordinary extent; and generally supple- menting local and individual efforts.

Regarding the moral aspect of advertising two public and competing services, often owned and controlled by the same authority, particularly gas and electricity, keen competition and commercial rivalry between two or more producers or sup- pliers performing in some respects similar services is a state of affairs not only calculated to bring out the best, but is ulti- mately beneficial to the public. The Electrical Development Association has always held the view that it cannot be both judge and advocate; it prefers to be single-minded in its work, to push the use of electricity whenever it can and remain silent when it cannot, being content to leave the verdict to the people.

Tramway and Telephone Propaganda.

Tramway undertakings are able to advertise out of revenue, and they should set an example to the advertisers on their cars by employing only the best work in their own advertisements. The London County Council Tramways have done some excel- lent work in the way of Press advertisements, posters, leaflets, sport fixture cards, pocket maps, time-tables and other pub- licity.

There is a vast amount of work to be done in this country towards popularising the telephone. Great Britain actually stands fourteenth in its number of telephones per 100 of popu- lation. This state of affairs constitutes not only an appreciable handicap to the nation's trade and to national efficiency, but restricts individual comfort and convenience. In this country the telephone scarcely exists outside industrial and business life. To reach the density of telephone users compared with the population of Switzerland will require an additional 1,041,000 telephone stations at a capital cost of £52,000,000; to reach the Norwegian density will require an addition of 1,763,000 stations at a capital cost of £88,000,000; to reach the Danish density will require a capital outlay of £150,000,000 and the annual capital then required in the latter case to meet annual normal growth will be some £16 000,000, or double the present expenditure. The effect of these figures upon employment not only in actual telephone service but upon construction, maintenance, operation and administration, and also amongst many intermediate manufacturers of cable, lead, paper, cotton, timber, brass, iron, copper, rubber and silk, will readily be appreciated. Telephone development can only be accelerated by educating the public in the advantages of the telephone service. We shall probably see considerable activity in this direction in the near future; hardly any public utility gives advertising greater scope for ingenuity in its presentation.

The Glasgow Corporation Tramways.

Report for 1924-25.

We have received from the general manager of the Glasgow Corporation Tramways (Mr. J. Dalrymple) a copy of his report for the year ended May 31st, 1925. This shows an increase in the revenue from £2,323,246 to £2,352,470. The working ex- penses increased to a greater extent *viz.*, from £1,691,171 to £1,746,000, reducing the gross surplus from £632,075 to £606,470. The addition of interest on investments made avail- able £634,408. The charges against this were considerably heavier than those of the preceding year, amounting in all to £714,684 as compared with £585,366. The loss on the subway section rose from £3,544 to £18,710; the 'buses incurred a loss of £5,115; interest and sinking fund increased from £69,773 to £121,952; income tax from £40,481 to £75,931; and the con- tribution to the permanent-way renewal fund from £203,319 to £252 853. The net result was a deficit of £80,276, as com- pared with a profit of £49,199 in 1923-24. From a table show- ing the financial results from 1901 to date it is seen that this is only the second occasion on which a deficit has been in- curred. In the previous case the adverse balance was carried forward and wiped out in the succeeding year.

The capital account shows an expenditure of £474,043 during the year, bringing the total up to £6,500,207. The year's ex- penditure includes £145,803 on the permanent way; £124,502 on the electrical equipment of the lines; and £48,554 on power- station and sub-station plant.

The traffic statistics record a car-mileage of 30,937,196, an increase of 1,292,098, while the number of passengers carried rose from 430,226,561 to 439,340,730. The consumption of elec- trical energy was 2,549,115 kWh higher at 51,324,436 kWh. The ratio of working expenses to traffic receipts rose from 72.94 to 74.36 per cent. The total length of route in operation at the close of the year was about 135 miles, an addition of about six miles since the last report. The number of cars was one less at 1,087.

A full analysis of the passengers carried and the revenue ob- tained from each fare is given in the report. From this it is seen that the penny fare is the most popular, 152,915,632 passengers, or 34.81 per cent., having travelled at this rate. The most revenue, however (30.72 per cent.), was brought in by 1½d. fares. Only 1.17 per cent. of the revenue was derived from fares over 3d. Another table shows the amounts paid in rates by the undertaking for each year since its inception; the figure for the past year shows a remarkable increase—from £40,481 to £75,931, but it is noted that this was due to a rise from £282,530 to £400,000 in the valuation of the undertaking, although the rate fell by 6d. in the pound.

A separate part of the report is devoted to the subway section which was acquired by the Corporation in August, 1923. There was a revenue of £99,269, but after the deduction of working expenses the surplus was only £769. To this was added interest, &c., making £3,192, but the deduction of capital charges resulted in a deficit of £18,710. The section carried 20,008,445 passengers and the car mileage was 1,266,713. The length of the track is 13.12 miles and 50 cars are operated.

The Electrical Imports of Argentina.

The Argentine Government has recently issued detailed statistics of the country's foreign trade in 1923 and 1922. These permit of a much more comprehensive survey of Argentine imports of electrical goods than has hitherto been possible. The following table shows the values of the various descriptions of electrical materials imported, together with a note of increases or decreases. The values are the Argentine Customs Tariff valuations; the gold peso = about 4s.

New Electrical Devices, Fittings, and Plant.

(Readers are invited to submit particulars of new or improved devices and apparatus.)

New Foundation Construction for Transmission Poles.

The "Anchora" pole, a production of MESSRS. ARMSTRONG, EDISON & Co., 17, North Bridge Street, Sunderland, has been designed with a view to simplicity in construction and rigidity in service. The feature of the pole lies in the construction of the foundation, fig. 1. Main baulks are provided on both sides of the legs and anchor baulks are secured to the ends of these at right angles. The main baulks are placed at the extreme ends of the pole butts and galvanised wrought iron ties are provided for transferring the upward pull on the legs to the foundation; these ties connect either the main or anchor baulks to the legs at a convenient distance above the main baulks and below ground level. Bent metal plates of channel section are provided for transferring the compression load

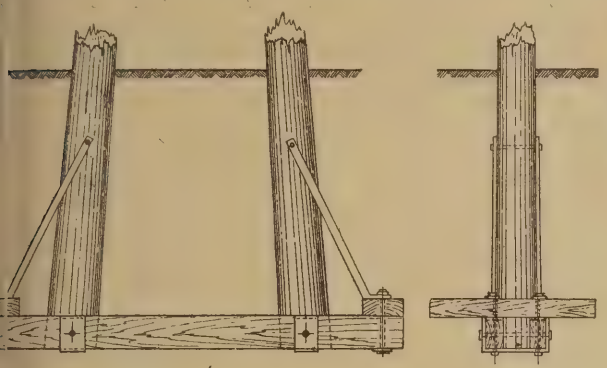

Fig. 1.—Showing Foundation Construction of the Anchora Pole.

from the legs to the foundation, passing over the top of the main baulks and underneath the pole butt. In excavating for the foundations, the hole should, where possible, be under-cut at each side to receive the anchor baulks connecting the lower ends of the legs after the latter have been placed into position, the solid undisturbed earth above the baulks offering increased resistance against overturning.

Both 'A" and "H" poles are constructed on these foundations. An "A" pole, with the "Anchora" construction, under test is said to have been loaded up to 3½ tons at a point 31 ft. above the ground level.

A New Electric Ironer.

The accompanying illustration, fig. 2, is of the "Grand" electric ironer, a new product of the COFFIELD WASHER CO., Dayton, Ohio, U.S.A., which is being marketed in this country by MESSRS. L. G. HAWKINS & Co., LTD., 30-35, Drury Lane, Kingsway, London, and which was exhibited at the I.M.E.A. Convention at Brighton in June. The machine is light and

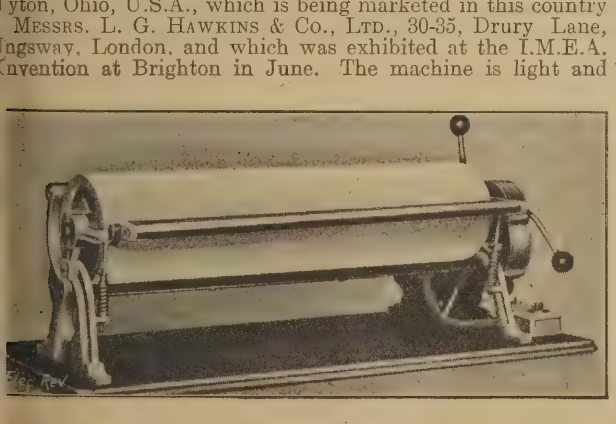

Fig. 2.—The "Grand" Electric Ironer.

portable, it weighs 76 lb., and its roller measures 26 in. in length. It is both operated and heated electrically, a small motor being provided for the operating. Both the motor and the heating elements are controlled by switches conveniently placed at one end of the base board, and mechanical control levers are provided at one end of the roller for its operation.

Electric Furnace Regulators.

For the control of electric arc furnaces employed for making calcium carbide, abrasives, alloys, &c., the GENERAL ELECTRIC Co., Schenectady, N.Y., has placed on the market, according to *Chemical and Metallurgical Engineering*, some new types of regulators for use with one-, two- and three-electrode equipments for which an auxiliary control panel is required. The advantage claimed is a decrease of the time interval between any change in current and the functioning of the equipment to overcome the change, in order to maintain a constant current. This is accomplished by the use of new punched frame contactors, inherently quick acting. The dynamic braking circuit is also completed in a shorter interval of time after the power is removed from the motor, thus decreasing to a minimum any over-travel of the electrode. Another advantage is the elimination of bearings or parts subject to wear.

A new voltage relay has been used to prevent the lowering of the electrode into the furnace in the case of supply failure or unbalanced conditions in the furnace. This relay permits a very low calibrating value, allowing the arc voltage to decrease to about 25 V before opening the control circuit to the lowering contactor.

A Mechanical Cable Union.

What should prove of value in the connecting of cables to "live" bus-bars or in making connections in places where it is dangerous to use molten metal, is a device which has been

Fig. 3.—Section through the Mechanical Union.

designed by MR. C. TURNOCK, 41, High Street, Aston, Birmingham, in the form of a mechanical cable union which can be adapted for use with terminal lugs or couplings.

Fig. 3 is of a section through the union. It consists principally of two main parts, a gland A which is threaded into a trunk B, and each part is constructed with an internal bevel edge. A split ring which is placed under the outer layer of conductors creates a bulge on the cable core which is gripped between the gland and the trunk at the bevel edges. Both the gland and the trunk are hexagon shaped, so that the union can be tightened up by means of a couple of spanners. This device is very strongly constructed and the joint can be made very speedily. The maker claims that contact is made at four points, the butt end, the end circumference, and each side of the cone or bulge on the cable core.

In the case of the cable lug the union trunk forms a projection of the lug as in an ordinary sweated terminal, and in the case of the coupling a double union is used, one at each end of the trunk.

A New Lamp Fitting.

The accompanying illustration, fig. 4, is of a new design of lamp fitting, the "Wigan" prismatic, recently put on the market by HEYES & Co., LTD., Water-Heyes Electrical Works, Wigan. It carries a prismatic glass moulding, by which the light is said to have a reflected area of 180 deg. from the plane of the fitting. It occupies about the same space as the standard type of bulkhead fitting, and the makers claim that it

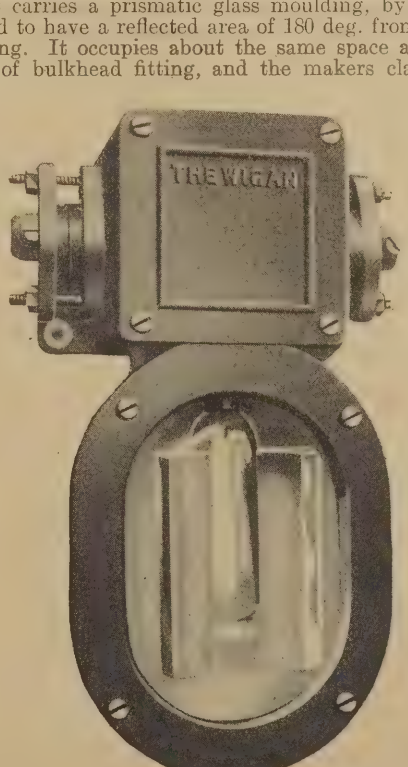

Fig. 4.—The "Wigan Prismatic Lamp Fitting.

gives a normal front with an increased side illumination, and is suitable for use in place of the standard bulkhead fitting. It can be supplied with or without the joint box attached.

The International Railway Congress.

A Review of some of the Electrical Features.

(Concluded from page 72.)

High-Speed Electric Locomotives: *Discussion (continued).*

The next point discussed was to what figure had the maintenance of d.c. and a.c. motors been reduced, and what mileage had been found possible without examination requiring more than one day.

Mr. BIANCHI said that in Italy there were machines which had been in service 15 or 20 years, and had not required repair so far as the electrical part was concerned. The only repairs necessary were to the frame of the engine.

Mr. WALLIS said that in the United States they believed that the cost of a.c. single-phase motors, as compared with d.c. motors, was slightly greater, but that experience was based on cars rather than on locomotives.

Mr. STEINER considered that the single-phase a.c. motor was often unjustly criticised, and that it would not cost much more to maintain than would the d.c. motor. Very varying results had been obtained with commutators.

Mr. PARODI maintained that the motors built 20 years ago were better than the new motors from the point of view of construction, though the new motors were better designed.

Mr. BIANCHI said he had some d.c. motors which had been in service for 25 years, and were still running well; he considered them the best motors he had, and agreed that modern motors were not so satisfactory. The latter were smaller and more heavily loaded, using forced ventilation, and consequently were more liable to cause trouble, particularly if the fan failed.

Mr. WALLIS said there was a disposition in America to sell a smaller motor for a given h.p. than was the case 10 years ago.

The remainder of the discussion was devoted to a comparison of the mean distance run by electric and steam locomotives of the same class, and the steps being taken for operating electric locomotives by a single man.

Mr. WALLIS said that steam locomotives in America were running as much as 500 miles on one trip. There was no experience as to how electric locomotives would compare with them under such circumstances, but they were expected to cover at least 30 per cent. more mileage in a month than the steam locomotives on normal service.

Mr. WEISS said that on the Simplon line in Switzerland they were able to get 15,000 km. (9,400 miles) monthly out of each electric locomotive, whereas the mileage when the line was steam operated was from 10,000 to 12,000 km. per month (from 6,000 to 7,500 miles).

Mr. WALLIS said he was informed that on the New York, New Haven, and Hartford Railroad the average mileage with all the electric locomotives was 200 per day, and they had obtained 500 miles a day with a single locomotive.

Mr. WEISS referred to a Swiss line on which both steam and electric locomotives were used, the latter being of the 3-phase type, but the high-speed trains were drawn by the electric locomotives.

Mr. BIANCHI pointed to the different results obtained with different locomotives. In Italy, with the 3-phase locomotives, the time during which they were stopped for repairs was between 25 and 50 days annually, whereas the d.c. motors ran for two years without serious repairs being necessary.

Mr. WEISS, replying to a question by Mr. C. Renevey (Alsace-Lorraine) said that, from the point of view of heavy repairs, electric locomotives showed better results than the steam, but, from the point of view of small running-shed repairs, the steam locomotives were better, probably due to the fact that electric locomotives were still new.

Mr. BIANCHI said that, in Italy, cars were driven by one man only, the "dead man's" handle being used. It was hoped to apply to high-speed electric locomotives shortly an arrangement which would enable the driver to leave the handle for a period not exceeding a minute, or half a minute, after which period the current would automatically be cut off.

Mr. L. M. BARNET-LYON (Holland) said that, although it was easy to control an electric locomotive, there were other duties to be carried out on a locomotive, and it was open to question whether one man would be sufficient.

Mr. WALLIS said that it was the universal practice in America to have two men on electric locomotives, but one man only on multiple-unit car trains.

Mr. H. N. GRESLEY, C.B.E. (L. & N.E. Railway) said that that practice was also universal in this country.

Summary of Conclusions.

On Monday morning (June 29th) the conclusions arrived at as the result of Friday's discussion were considered by the meeting, and summaries of the views expressed on the nine questions submitted for discussion were adopted by the meeting.

On the first question the summary put forward for consideration stated that the tram and gearless types of drive could be used on high-speed locomotives, and give good running. It was, however, necessary, taking into account the weight not spring-borne and the relatively low centre of gravity, t reduce as far as possible the weight per axle. Mr. M JAPIOT (Paris, Lyons and Mediterranean Railway) consider it would be dangerous to put in a clause saying that it w desirable to reduce the weight per axle. No evidence ha been given showing that this was really necessary. If t summary were adopted in the form suggested, permanen way men might make a stand against it, and might wish limit the axle weight to about 12 tons per axle, but if t weight were 15 or 20 tons, he would be content. Finally t resolution was passed in the following form:—

1. "The tram and gearless types of transmission can used on high-speed locomotives, and give good running. has been found advisable, when taking into account t weight not spring-borne and the relatively low centre gravity, to limit the weight per axle to reasonable limits."

Resolutions relating to the remaining questions were adopte as follows:—

2. "The quill drive can be, and is used on high-speed loc motives. The quill and driving shaft should be kept as f as practicable concentric, and the condition of the track shou be good. The difficulty of maintaining concentricity increas with the number of axles on one frame."

3. "It would be as well, in the case of high-speed locom tives driven by rods, to incorporate shock absorbers in t transmission. The fitting of the rods should be careful maintained in all cases."

4. "Different types of transmission, with oil or grea lubrication, are actually in use on high-speed locomotives, ar generally give satisfactory results."

5. "There is insufficient experience so far to enable recon mendations to be made as between the rod and the dire drive for high-speed locomotives, both types being actual in use. Bissel trucks or bogies only appear to be required locomotives running at very high speeds."

6. "The use of oil switches and transformers is gener on high-speed locomotives working an a.c., and do not appe so far to have given risen to any particular trouble."

7. "The electro-pneumatic control appears to be the one th should give the best results on electric locomotives."

8. "Electric traction by high-speed locomotives has not be in use long enough to enable any judgment to be arrived as to the difference in cost of upkeep of the various type motors, but it appears that it will be small."

9. "The working is arranged so differently on the pri cipal railways so far as the use of high-speed steam and ele tric locomotives is concerned, that it is not possible to con to any definite conclusions as to the relative mileage the engines can run between heavy repairs. Up to date, bo experience and calculation indicate that the electric locomoti will give a better mileage than the steam locomotive."

With regard to the question of the steps that had be taken to operate electric locomotives by one man, a summa was suggested to the effect that nobody had yet operat high-speed electric locomotives with one man, either with without safety devices, although this question was under co sideration in different countries. It was stated, in this co nection, by M. Lacoin (Paris-Orleans Railway) that tw French railways had passenger and freight locomotives th were capable of a speed of 90 km. (56 miles) per hour, a they intended to work them with only one man. He su gested, therefore, that the proposed resolution should made to refer to "very" high-speed locomotives. After son discussion, however, it was suggested by Mr. J. T. Wall (Pennsylvania Railroad) that this was a labour question, a did not concern engineering, and that the summary shou not be put forward at all, which course was agreed to.

Miscellaneous Proceedings.

During the second week of the Congress the questions und discussion by the various Sections in connection with a numb of aspects of railway administration were disposed of, a more time was devoted to visiting railway works in vario parts of the country. Among the questions discussed by Se tion V (Light Railways and Colonial Railways) was that "Traction for Light Railways." This turned largely upon t merits of traction by steam and by internal-combustion e gines and there was little discussion with regard to electricit The adoption of electric traction depended essentially financial considerations; in proportion as initial expenditu and working expenses diminished, it would be possible develop the use of this system.

In connection with a discussion on the breaking of rails Section I. (Ways and Works), a report was presented fro Japan describing an apparatus called "The Magnetic Ra Defectoscope," for examining from the outside, without spo ing the rail, internal defects such as local segregations of in purities, &c. The principle of this apparatus is as follows When a ferromagnetic substance, such as iron or steel, placed in the magnetic field, it is at once magnetised by ma netic induction. When the magnetic permeability is invariab

over the whole length of rail, the magnetism induced by a constant magnetising force is invariable, but if the permeability varies owing to some fault existing in the rail, the variation in the induced magnetism in that part causes a leakage of magnetic flux, the amount of which can be shown by testing with an exploring coil. The measurement is carried out by placing a horse-shoe magnet on the rail head and sliding it along from one end to the other. An exploring coil is fitted on the surface of the rail between the two poles, and slides with the magnet so as to cut the leakage flux. The reading of the galvanometer is taken on a recorder.

According to the programme of the Congress, the closing ceremony should have taken place on Thursday morning, July 9th, but, no doubt in order to allow the delegates more time to get to Darlington for the railway centenary celebrations this ceremony took place on Wednesday. It was preceded by a general meeting, at which the question of the re-admission of ex-enemy countries and Russia to the Congress was discussed. A request for re-admission had been received from Russia, but it was decided that the situation in Russia, particularly from the railway standpoint, was not sufficiently stabilised to justify re-admission to the Association of the railway administrations of that country. With regard to Germany, whilst no formal request for re-admission had been made, semi-official negotiations had been in progress. There was some discussion on this point, but finally, the voting of the delegates was in favour of the re-admission of Germany, on the same terms as other nations.

Correspondence.

Installation Policy.

I have been deeply interested in reading the paper given by Mr. L. L. Robinson before the I.M.E.A. at the Brighton Convention; as the author's ideas and statements are such a mixed conglomeration, in fact a real "Irish stew," it is difficult to pick out the solid food and know what his policy really is.

On reading through his paper and taking things in general one gathers that there is no one capable of satisfactorily dealing with installation work but a municipal electric supply department with a highly paid chief at its head, a highly paid staff of experts (whatever this may mean), another staff of supervisors, and a large staff of competent workmen; and yet, although in Mr. Robinson's opinion the above is the right and proper way, he looks forward to the day when anyone can go to a "Robinson Woolworth & Co." bazaar and buy a complete wiring installation over the counter and erect it himself.

If the latter is what Mr. Robinson really does want, I would suggest that he leave his present padded armchair provided by the public, give up his handsome salary paid partly by electrical contractor ratepayers, start a Robinson Bazaar for the sale of house lighting sets in cardboard boxes and get the schoolboys of Hackney and district busy in electrifying the district; and we shall very soon have a second edition of the Great Fire of London. When this time arrives, I sincerely hope the Robinsonian Electrical Bazaar will be in the midst of it, but that the author and perpetrator of such a scheme will be spared to see the folly of his ways.

Now to more detail: although Mr. Robinson explains at the outset that he does not damn the electrical contractor, I consider his paper is a general condemnation of the contracting industry at the present time. He did not propose to deal with wiring and installation work, and yet he dived into wiring and installation work to the point of lowering it to the 6½d. bazaar level.

I would like to ask Mr. Robinson if he considers that the gas and waterworks departments of our Corporations should also carry out the whole of the installations of gas, lighting, heating, power and water distribution in the whole of the premises where these services are needed and used, as this would be on a par with part of his gospel.

If the objective of municipal electrical suppliers to give a perfect service, &c., without a loss, then Mr. Robinson has all his work cut out to do this consistent with the service being as cheap as it should be. What is wanted of Mr. Robinson and all suppliers is a cheap supply of electricity, and the contractors will see that the installations to use a cheap supply are put in at a reasonable rate, consistent with good-class workmanship, reliability, and satisfaction.

Mr. Robinson goes on to state that the primary object of a wiring contractor is to make a profit. This, Mr. Robinson, as far as the better-class contractor is concerned, is not the truth. Profit is only one part of his object, the other parts being a reliable and efficient installation, carried out with materials and apparatus suitable for the work it has to perform, thereby ensuring continuity of service, which the customer expects and is entitled to, and a satisfied client who will come again or recommend his friends. The profit portion is the last item, and if the contractor gets any after completing the job as above, he is rightly and justly entitled to it.

According to Mr. Robinson's statement, a wiring contractor will sell anything that carries a big profit, whether the best service is given to the consumer or not. This is one of the foulest libels ever levelled against the contractors, who have in their ranks a number of the ablest men in the industry to-day, and who are also honest.

If Mr. Robinson has the interests of the electrical industry at heart, I ask him, as a gentleman, to withdraw the innuendoes made in this clause of his paper.

Is it not sound policy to give a consumer an installation that is best suited to his requirements, consistent with safety and satisfaction in use, and at a reasonable cost to the user?

Requirements vary, and no one knows better than the contractor how much, and no one gives more time and thought to these matters than the contractor.

Mr. Robinson appears to be at daggers drawn with the contracting industry, whereas he should realise that the contractor is the best friend of the supply engineer, the unpaid canvasser of every undertaking, who instead of being kicked and blackballed should have his friendship and well-being cultivated.

Thank goodness we are still blessed with a majority of sensible and reasonable-minded central-station engineers, who appreciate the value of reliable contractors in their midst.

Instead of setting-up huge wiring departments with staffs of unproductive officials, as suggested by Mr. Robinson, far more good would be done by making more use of, and encouraging, the contractor, even if the supply authority went to the extent of subsidising him to the extent of one shilling per 60-watt lamp, and 10s. per kW of other plant that the contractor canvasses and works for and gets connected to the mains. After all, who benefits the most? Why, the central-station engineer, who has a customer for always once he is connected, whereas the contractor very rarely gets any more revenue from him except for a few lamps or a pair of brushes and a heating element occasionally.

A policy of close co-operation between the supply authority and the contractor is the best policy Mr. Robinson can adopt if he is desirous of extending the number of installations on his mains; above all let him cultivate co-operation with registered contractors, and not the "curbstoners" he raves so much about, the "here to-day and gone to-morrow" crowd.

Many interests have been striving during the last few years to develop a close co-operation between all sections of the electrical industry, which is all to the good, but Mr. Robinson's paper is a direct slur on all those excellent gentlemen who have given much time and thought to the furtherance of co-operation in the electrical industry.

Harry Moss, A.M.I.E.E.,
National Registered Electrical Contractor.

Bradford, *July 6th*, 1925.

I have read Mr. Robinson's paper in the ELECTRICAL REVIEW and his reply to criticisms.

He states that he is now working through contractors on the basis of schedule prices and specifications which have been drawn up in co-operation between contractors and himself.

As far as I know there are only two registered contractors within his area, one of which is the firm of which I am the principal. My own firm has not been approached regarding work for the Hackney Borough Council, neither have we done any contracting work for it since war time, when we were all short-handed. It appears to me, therefore, that the work he talks about as having been arranged and placed with contractors has all gone to one man, and as I have been a ratepayer within his borough for years, it is scarcely a fair way of dealing with such work.

Only about twelve months ago his staff took an order from a firm for whom we had worked for years. To get this order they must have undercut, as I quoted at estimated net cost, knowing that I was in competition with them. Is it to be wondered at that contractors hit back when such things occur?

Mr. Donald Munro's letter in last week's issue of the ELECTRICAL REVIEW expresses the opinion of the majority of electrical contractors. It points out plainly that such men as Mr. Robinson would not be in existence had not electrical contractors carried out the spade work, and prepared the way for them.

It is only of recent times that Mr. Robinson has seen fit to express views concerning contractors as he did at the convention of the I.M.E.A., and for what reason it is difficult to conceive. In this world I take it that no two people have exactly the same views on any subject, but two people having identical interests have no need to run down each other simply because they do not agree on certain fundamental questions concerning the methods of running their respective businesses, and I may remind him that neither party can work amicably with the other unless both make up their minds to agree to differ.

Unfortunately I am one of the small-minded contractors in the eastern area of London, who apparently are not the sort of men that ordinary engineers could associate with. This may be so, but I have dozens of electrical and mechanical friends who, I am certain, would go out of their way to help me, if I needed help, and I cannot suppose that they are all small-minded persons as well as myself.

The whole question of municipal trading appears to be one of money. Mr. Robinson's policy is to keep up the price of the unit and give free service, at the same time charging for laying services, which after all belong to the borough. Do other municipal engineers also agree with this, and is it policy to charge high prices for the commodity they have to sell, and cut the prices of installations? Surely their whole energy

should be devoted to making the price of current such that it would compete with all other classes of fuel and light, and then electrical energy would sell itself. They could well leave installation work to people who have devoted their lives to the subject, and like Ford cars, electricity would become universal.

Mr. Robinson states that contractors are out to make profits. Of course they are, otherwise they could not live, but is not his whole time spent in conceiving ways and means of making profits? He gives away on one hand to show a profit on the other, so where lies the difference between him, and the contractors of whom he speaks?

As far as my own firm is concerned, two or three years ago we stocked practically everything electrical. We were the first people here to stock, demonstrate, and sell electric washing machines, electric sewing machines and so on, and given fair play we should now have been doing good business in this direction. At that period the Hackney Borough Showrooms were equipped with a few motors and possibly a cooker, but very little besides, and just as we were beginning to make headway, an exhibition was organised by the Corporation at the Hackney Baths, but NO ELECTRICAL CONTRACTOR WAS ALLOWED A STAND. The Hackney Borough, of course, was there, but contractors had to content themselves with being spectators. Since that time our sales have gone down 100 per cent., and we have lost at least two or three good orders through the Council engineers. As I know my business thoroughly, it makes me very sore to think that on one hand the Council takes my rates, and on the other, takes away my means of paying them through absolutely no fault of my own.

H. Linzell, A.M.I.E.E.

London, *July 10th*, 1925.

Artificial Crop Drying.

I am afraid that personal differences can hardly be of interest to your readers, hence I do not think it worth while replying at length to Captain Owen's letter in your last issue.

His communication confuses several technical points. I agree with him that when hay is made artificially by a process which is an incomplete copy of mine, results are not good, as was proved at a very considerable expenditure of money by the full-size tests made recently by the Ministry of Agriculture.

Chemical analysis and tests by feeding to cattle have demonstrated that my process gives superior results to average weathered hay. This the Ministry has not had an opportunity of sampling, as even the test it ran on my farm was of a modified method.

My process covers both hot- and cold-air methods; this takes away a lot of the point of the letter.

I am pleased to say that at last I have received an indication that the Ministry is—somewhat tardily—going to recognise what others and myself have done in bringing to the fore this new development.

The Ministry and the Oxford Institute of Agricultural Engineering have done a great deal of most valuable laboratory research work in this subject. This has cleared up many empirical matters, and due credit should be given to Captain Owen for his share in this, also for the development of an excellent oil-fired pre-heater. This, however, does not alter the fact that if they had been willing to give due recognition to the pioneers, the country would have been saved some thousands of pounds which have been expended in useless experimental work. However, we all know the little ways of a Government Department.

R. Borlase Matthews.

East Grinstead, *July 11th*, 1925.

I regret that Mr. Borlase Matthews apparently finds several unpalatable truths in my recent article on the above subject. This hardly justifies the serious mis-statements which he makes on the hot-air system, which certainly has proved itself in practice, as your correspondent must know.

I worked the cold process for three seasons, on Mr. Matthews's own 600-acre farm and elsewhere, and I am therefore well acquainted with its practical difficulties and the unreliability of the product, but I have never yet seen a hay rick, good or bad, made by it which exceeded 17 tons finished weight. Surely it is better to succeed (as the hot-air process does) with real 10-ton stacks made on sound lines than to fail with mythical 25-ton ricks made on an unscientific and rule-of-thumb basis.

Your correspondent refers to clover or " seed " hay as a crop which possibly justifies the use of preheated air. He might have stated at once that he has never succeeded, nor have I, in making even passable seed hay by his cold-air process. In Scotland there have been repeated failures, and last year Dr. Hendrick, of Aberdeen, published a report describing these negative results, in which he condemned the system, root and branch.

I cannot imagine anyone who has really understood the nature of the problem presented by artificial crop drying ever rejecting the pre-heating idea, especially on theoretical grounds. It would be very interesting to have some definite reasons given for the alleged superiority of cold air. Your correspondent, I now understand, originally tried the hot-air system, and it is to be regretted that he did not succeed with it for crop drying.

I am sorry that I am unable to follow your correspondent's meaning when he states: " Equally good hay could be produced by either method, provided the methods adopted for the cold-air system are adopted in conjunction with the hot-air way." Perhaps it refers to the elimination of structures inside the rick and to the use of a plurality of cavities, spaced to give approximately equal air resistance, whereby larger ricks are possible, at least for cereals. This arrangement, suggested and developed by myself, is covered by Mr. Borlase Matthews's patent, but I am not sure that it would work very well with the higher air pressures used with the hot-blast process.

I do not admit that an error crept into my article regarding the preference which cattle show for hay made by pre-heated air. It is true, however, that no direct comparison has yet been made, perhaps because of the difficulty in getting cold-blast hay in sufficient quantity to run a proper test. His remarks, therefore, that the cheaper method, without pre-heating, should produce a slightly better hay, refer to a condition of things which hitherto has not obtained in practice. In any case, to call the " cold-blast " process " cheaper " is hardly justified so long as it works on an intermittent basis. The cost of inspecting thermometers and blowing for a short time daily must ultimately be greater than the one long blow which gives results. If your correspondent will study the experiments which have been made, particularly in America, by nutrition experts, he will realise that his " hay," even at the best, can never equal in feeding value that made without fermentation and the action of sun and rain. This is seen in the analyses given in my article. Hot-blast hay gave 2.1 per cent. nitrogen, while good sun-made hay showed 1.9 per cent.; fermented hay—the cold-blast process is based on the control of this supposed necessary process—had only 1.7 per cent., while the worst hay, weathered on the field, gave 1.5 per cent.

Mr. Matthews implies that his patent covers pre-heating, though I doubt if he is first in the field, for it is certainly an old idea, going back about 50 years. So far as I can see, any practical form of heating equipment used to-day for the purpose would infringe one or other of the many detail patents controlled by the Crop Drying Company. Your readers, therefore, need not fear that in buying equipment, made under that company's licence (and there is no other on the market at present in a practical form), they will be infringing your correspondent's patent.

H. A. Carney.

Lingfield, Surrey, *June 28th*, 1925.

Radio Trade Discounts.

I notice from an announcement which appeared in *The Radio Trade Journal* of July 4th that the N.A.R.M.A.T. has tardily recognised that the existing discount which its manufacturing members are allowed to offer is insufficient. The Wireless Retailers' Association has always contended that the terms are altogether inadequate and should be increased to the amount allowed in kindred trades, namely, 33⅓ per cent. Short of this figure reasonable profits cannot be made, since considerable deductions for overhead charges and service have to be allowed for by the dealer.

The small increases now promised will be welcomed as a move in the right direction, but the method of initiating them will be strongly deprecated by the great mass of dealers. In order to be eligible for these increases dealers must either be or become members of the N.A.R.M.A.T., which implies that they must among other things bind themselves not to deal in oversea apparatus.

Very rightly the average dealer feels that he is entitled to be and to remain a free agent. He holds the conviction that he should be untrammelled by arbitrary conditions imposed by manufacturers, and strongly objects to interference with his liberty of action. Even more resolutely is his face set against anything which may appear to tend in the direction of monopoly.

In making these remarks I speak as one who has had an exceptional opportunity of gauging the opinions of the retail trade.

The Executive of the N.A.R.M.A.T. appear to have overlooked the fact that the weapon they are employing is a double-edged one, and also that preferential treatment need not necessarily be confined only to one quarter; and I commend these considerations to their serious attention.

There are large numbers of manufacturers of apparatus of the highest class not associated with that body who are in entire sympathy with the W.R.A., and the demand for oversea apparatus is growing apace.

I am, however, disposed to believe that the consequences of this movement will be such that the N.A.R.M.A.T. will have no alternative to extending these increased discounts to dealers generally; but in the meantime they are alienating large numbers of retailers, and this at a moment when the crying need of the industry is for goodwill, harmony and co-operation.

Fredk. S. Horsey,

Chairman of The Wireless Retailers' Association.

London, *July 10th*, 1925.

The Dimensions of Commutators.

A friend who happened to be using the formulæ in my article relating to the dimensions of commutators, published in your issue of March 13th, 1925, has kindly pointed out to me that on page 405 the symbol L/λ has been wrongly printed as $L\lambda$ in two places: once in equation (5) in the right hand column, and again at the beginning of the fifth line from the foot of the same column. I would ask you to publish this note for the benefit of any readers who may be interested in the matter, so that they may insert a stroke between L and λ

oth places. I am sorry that these errors should have rred in important equations, presumably through incom- e alertness on my part in reading the proofs.

Thomas Carter.

ewcastle-on-Tyne, *July 10th*, 1925.

Celluloid in Accumulators.

common with your correspondents on the subject of the tion of celluloid cases, I appreciate the timely letter "Surveyor" of May 11th, followed by the valuable rded experiments in your issue of June 12th by Colonel H. Page and Mr. C. E. Hume; further corroboration of danger from fire was also given by "M.I.E.E., &c.," on e 26th.

he danger due to the ignition of celluloid cases I now avoid employing cells fitted in glass containers, which have the her advantage of the absence of acid frothing, with the al deterioration of the insulation.

pparently it is not generally known to your readers that A. F. A. Accumulator Co., Ltd., having realised the danger ire due to employing celluloid cases, have for several years t specialised in manufacturing cells fitted in toughened ss grooved containers, which are supplied from one-ampere- ur size. Obviously, if the A. F. A. type of cell in glass con- ners were generally employed, the present danger of fire ild be eliminated.

Chas. Lack.

hornton Heath, *July 7th*, 1925.

Special a.c. to d.c. Rectifiers.

shall be obliged if you or any reader can put me on to or two makers capable of turning out a fair number of ll rectifiers as per short specification given below:—

all capacity alternating-current rectifiers of full-wave type, deliver rectified, or direct, current from a.c. mains of the al service voltage, 220-230 V. The rectified current to be a voltage as near as practicable to the original a.c. supply 220-230 V, and the current in the neighbourhood of 0.1 e-tenth) of an ampere. The rectifier to be in as simple and mpact a form as possible, without moving parts, noise- s, and free from liquid, unless hermetically sealed, prefer- y of a type not requiring frequent renewals, such as tubes, bes, &c. The rectifier to be capable for functioning for iods of 6-8 hours continuously, and to require an absolute imum of attention. Price being a consideration, the sug- ted preferences depend on the cost involved.

Rectifier.

July 8th, 1925.

A British Institute of Radio Engineers.

May I be allowed to occupy your space for a few lines, to ply to Mr. Nelson's letter in this week's issue of the ELEC- CAL REVIEW?

Mr. Nelson says, ". . . surely if the Americans can run a cessful Institute of Radio Engineers as well as the American stitute of Electrical Engineers, we Britishers can do the ne." I would like to point out that the American Institute Electrical Engineers has no Section devoted especially to reless matters, and in fact, on looking through the pages of *Journal* of the A.I.E.E., one finds that wireless subjects very sparingly dealt with. In other words, the A.I.E.E. es not pretend to cater for wireless engineers to anything e the same extent as the Wireless Section of the I.E.E., and is not surprising, therefore, that a separate Society exists in erica for the reading of papers, &c., on wireless matters. this country, on the other hand, we have a technical body ich started its existence as the Society of Telegraph Engi- ers and Electricians, and to start a new Society of Telegraph gineers, which is what Mr. Nelson's proposal amounts to, ms to me a very undesirable step.

I still maintain that the qualifications necessary for mem- rship of the I.E.E. are necessary to a wireless engineer, and brand an engineer as a wireless engineer by giving him some ters to put after his name is a very dangerous practice unless ere is at the same time some guarantee that the engineer s had a thorough electrical training.

I would suggest to Mr. Nelson that there are quite a number people in this country who are members of the American stitute of Radio Engineers but who are not in any way pro- sionally engaged in wireless engineering: who are, in fact, nateurs. The I.E.E. is not open to amateurs, however skilled ey may be, and consequently they applied for and gained embership of the I.R.E. My only comment on this is to peat that amateurs should join an Amateur Society and not rive after professional honours unless they desire to become ofessionally engaged—in this case, in wireless engineering. is for this reason that the Radio Society of Great Britain s resolutely refrained from encouraging its members to call emselves M.R.S.G.B.

I am quite ready to admit that the constitution of the Wire- s Section of the I.E.E. might be revised so as to meet the quirements of Mr. Nelson's friends in some way, but I most phatically maintain that there is not room for *both* the esent Wireless Section of the I.E.E. and the proposed new ciety.

I am confident that this matter can be left in the hands of Committee of the Wireless Section of the I.E.E., for, after if this new body comes into being it is *their* funeral, not ine.

J. F. Stanley, B.Sc., A.C.G.I.

London, *July 13th*, 1925.

Legal.

Theft of Electricity.

ABEDNEGO JONES, described as a repairer, was fined 40s. at the Ebbw Vale Police Court on July 9th for the theft of electricity, the property of the Council. It was stated that an inspector discovered that the cable leading in to the defendant's premises had been pierced with a hatpin in such a way as to divert current from the meter.

A similar fine was imposed on Evan Evans, a fitter, on the same day for a like offence. In this case, although the meter had been disconnected, it was found that the defendant was still using electricity for lighting.

Claim for Injury through Electric Shock.

AT the Mayor's and City of London Court on July 6th, Ronald Evans, aged 20, of Lewisham, sought to recover compensation from H. W. Daniel, electrical engineer, Fetter Lane, E.C., under the Workmen's Compensation Act. For the applicant it was stated that he was cleaning electric light fittings at Smithfield Market in March, 1923, when he received a severe shock which made him jump a distance of nine feet and he was impaled upon a meat hook. The market was closed at the time but his cries attracted the attention of the police, who conveyed him to St. Bartholomew's Hospital. He remained in a convalescent home until June and then re-started work in August. Owing to nervous trouble he had to give up a fortnight later. Some time after applicant was examined and was found to have contracted phthisis, and medical witnesses attributed this to the effect of the accident upon the applicant's system. Another medical witness, who appeared for the respondent, said that the fact that the applicant had resumed work and had subsequently broken down led him to think that the accident was not the causative factor.

Judge SHEWELL COOPER, in making an award in favour of the applicant, said that the fact that he had never regained his normal health after leaving hospital, enabled him (His Honour) to say that there was reasonable probability that the applicant's present condition was due to the accident.

Guaranteed, Ltd., v. R. A. Williams.

IN the Shoreditch County Court, on Thursday, before Judge Cluer, Messrs. Guaranteed, Ltd., of 1-3, Sun Street, Finsbury, E.C., lamp shade and electrical fitting factors, sued R. A. Williams, of 33, Tottenham Lane, N., hardware and electrical fitting dealer, to recover £11 11s. 5d. for goods supplied.

An affidavit had been filed by Percy Evelyn Williams, which stated that he had been served with the summons, but he denied that he was R. A. Williams, and said the business belonged to his wife. He had never purchased goods from the plaintiffs.

Mr. ROBINSON, for the plaintiffs, said he admitted he was in a difficulty, but asked that the name of Mrs. Williams should be added to the summons, and that there should be an adjournment for him to make inquiries. If he accepted the affidavit of Mr. Williams, and sued the wife, then the wife might turn round and say that it was her husband's business.

Judge Cluer looked at the order, and found that it was signed in block letters, "R. A. Williams," and both Mr. Williams and his manager, Mr. Wright, having looked at it, denied having signed it, and also said that Mrs. Williams could not have signed it because she was ill in bed. Mr. Robinson said he had not the traveller there to prove the signature.

Judge CLUER said that a reasonable mistake had been made. He adjourned the case to enable the plaintiffs to make full inquiries.

Tucker v. Wandsworth Electric Mfg. Co., Ltd.

THE hearing of this case (*vide* our last issue, p. 53) was continued on July 7th before Mr. Justice Tomlin in the Chancery Division. Mr. J. B. Tucker asked for an injunction restraining the defendants from an alleged infringement of his patent for quick make-and-break tumbler switches.

The defendants, in support of their allegation of prior user and publication, said that switches had been made by Mr. Harry Rose, of Birmingham, before the plaintiff's invention, which contained the same features. Such switches had been used in H.M. ships and defendants alleged prior publication by McGeoch & Co., of Birmingham.

Mr. HOWARD MARRYAT, a member of the Institutions of Electrical and Mechanical Engineers, said he was an electrical contractor, and he remembered coming across the plaintiff's switch at a meeting of the Electrical Development Association in 1921, when it was passed round and discussed by the members. Before its introduction there were, he believed, no quick make-and-break switches with a positive action throughout. The provision of this motion was of great importance because if the spring failed and the switch had no positive motion throughout, the switch might be left in a very dangerous condition without that condition being obvious. The advantage of using a compression spring instead of a tension spring was that the latter was apt, if it broke, to fly into such a position as to cause a short circuit. The compression spring was not so liable and if it was guided it might remain in action if broken.

Mr. A. E. ILIFFE, sales manager of Metro-Vick Supplies, Ltd., said that he sold two models of tumbler switch, and one was the plaintiff's. In his experience the positive and quick make-and-break actions were a great advantage, and

the sale of such switches was likely to increase when the public became better acquainted with it. In cross-examination he said he knew that the Crabtree switch was largely sold. That had positive action at the start of the break and the start of the make.

This completed the case for the plaintiff, and Sir ARTHUR COLEFAX, K.C., making his submissions for the defence, said that the plaintiff's specification was not limited to tumbler switches at all, and there was not one word pointing out that the alleged invention was a particularly useful application in the case of a tumbler switch. So far as he could see the alleged invention purported to be something which was advantageously applicable, if at all, to all electrical switches of the quick make-and-break type of which there were others than the tumbler. This feature of the pivotal connection of a compression spring to the operating member and the contact arm was to be found in the Crabtree specification, which was old. The plaintiff's first claim was the mere addition of common knowledge to a device which was old. It included nothing but direct pivotal connection.

SIR DUGALD CLERK gave evidence with the object of showing that the defendants' switch did not contain anything of the plaintiff's invention.

On July 8th further evidence was called. The secretary of the defendant company said Mr. Rose called on him on October 4th, 1909, and produced specimens of a quick make-and-break switch and asked him to buy it or make it for him. He did not do so but gave him an order for a dozen, two of which were now produced.

Mr. H. W. COX, of Nottingham, said he held a patent of 1914 for improvements in electrical switches, and he supplied switches made to this specification to Harland & Wolff and the Air Ministry, and he had 30 men still making them.

The hearing was concluded on July 9th and his Lordship reserved judgment.

Parliamentary News.

[By Our Special Parliamentary Reporter.]

Automatic Signalling on the District Railway. — On February 6th Mr. W. THORNE asked the Minster of Transport if he was aware that there was a good deal of delay on the District Railway with regard to the early morning trains travelling between Barking and Bow Road, due to the absence of automatic signalling apparatus which was operating on the western section of the line; if he was aware that the London, Midland and Scottish Railway Company had promised to carry out this reform for some considerable time; and if he would state the cause of the delay in carrying out the suggested improvements.

Colonel ASHLEY said he understood that the plans and estimate for the automatic signalling work referred to were finally approved by the company last month, and that it was arranging to carry out the work as soon as possible.

Southern Railway Improvements.—On July 7th, Colonel Ashley informed Mr. BOWERMAN that the Southern Railway Company had stated that it proposed next year to re-open Deptford Station in connection with the introduction of electrical services. The railway company proposed to carry out improvements at New Cross costing about £9,000, and although in consequence of the numerous works already in hand it had been obliged to postpone consideration of effecting improvements at New Cross Gate, the desirability of carrying out such improvements would not be lost sight of.

Coal and Electricity.—On July 8th, during the discussion on the Vote for the Ministry of Labour, Sir A. STEEL-MAITLAND, giving reasons for the widespread unemployment in the coal trade, referred to the substitution of oil fuel for coal, and also to the substitution of water power for coal in the generation of electricity. He said that in Germany the utilisation of water-power had been increasing until nearly 1,250,000 h.p. was obtained from water, and every horse-power from water represented a loss of eight tons of coal annually. Taking the continuous power as a third of the full rating, the amount of coal replaced by water power in Germany was about 3,000,000 tons annually. The development of water power in France had been greater than in any other country, except, perhaps, Canada and the United States. No less than 2,500,000 horse-power had been developed from water power, with a corresponding substitution of coal. About one-third of the mileage of the French railways was now electrified, and with the exception of the district between Paris and Orleans he was informed that the whole of that was effected by electricity developed by water power.

Electrical Trade Position.—On July 9th, Sir P. CUNLIFFE-LISTER, the President of the Board of Trade in outlining the position in various industries, said that the exceptions to a general depression in the engineering trade were motors, which were booming, cycles, which were doing well, and the electrical industry, which was comparatively in a very prosperous position and was increasing its business largely, not only in the home market, but abroad.

Wireless Telegraphy (Explanation) Bill.—This Bill was read a second time in the House of Commons on July 10th.

Statutory Gas Companies (Electricity Supply Powers) Bill.—This Bill was read a third time in the House of Lords on July 9th.

Published Specifications.

The Evolution of Electric Cookers.

THE excellent collection of cooking apparatus brought together at the Brighton Convention of the I.M.E.A., of which we gave some particulars in our issue of July 17th, was noteworthy not only as evidence of the commercial activity of the manufacturers represented, who realised the importance of the opportunity to get into close touch with the municipal delegates and the Brighton public, but also on account of the indications of progress and improvement in design which were to be noted on every hand.

There was a marked tendency towards the adoption of "plug-in" heating elements—a feature which we have long hoped for. In some cases not only the top-plate fittings, but also the oven elements were of this type. This movement by no means indicates a lack of reliability, for steady progress has been made in the design of heating elements for long life, and at least one maker guarantees his boiling plate for twelve months (and expects the elements to last three times as long). Our own experience in this connection has been thoroughly satisfactory, but failures are bound to occur sometimes, and ease of replacement is a feature of great importance to undertakings which hire-out and maintain cooking apparatus.

In most cases the open top—more or less screened by a grid—was preferred for the boiling plate, but solid tops were also shown, and there is much to be said for the latter; if the loading of the larger plate is 1,800 or 2,000 watts, it acts quickly enough for all practical purposes. But there were several examples of boiling plates of refractory material, in which the heating spirals were adequately protected and the pans could sit on the plates themselves, and this seems to be a very promising direction for progress. The use of separate strips of earthenware or porcelain for supporting the spirals was widely adopted, and ease of rewiring was generally provided for.

The hinged top plate which gives ready access to the heating elements is a feature of many designs, and facilitates maintenance; at the same time, it ought always to be provided with a reliable fastening. The inquisitive child at a loose end must be borne in mind—what

he can accomplish with a hairpin or a pair of scissors is almost unbelievable, and various kinds of serious accidents would be made possible if he could raise the hob.

The design of the oven showed many improvements in detail. The internal corners were usually rounded, and other provision was made to facilitate cleaning—an important point which has not always been kept in mind. In some cases the whole of the interior casing could be removed bodily. The old controversy between side heating and top-and-bottom heating is not yet settled; each method has its convinced advocates. The question depends somewhat upon local conditions, which vary widely in different parts of the country. Some makers were prepared to fit either type, and at least one effected a compromise, which may add a little to the cost of the cooker, but will certainly increase its elasticity in use.

An interesting question is the demand for thermometers; these are usually fitted when asked for, and one maker put the proportion at about 50 per cent., but generally it appears to be less than this. The cost of the thermometer varies widely; we think it should be kept as low as possible, to encourage the use of the instrument and thus secure not only better cooking, but also economy of energy. In some cases a simple dial indicator depending on the expansion of metal or gas is substituted for the mercury thermometer; the former is certainly preferable on the score of legibility, and it should be possible to attain sufficient accuracy for practical purposes.

If the makers of electrical cookers, &c., could now get together and agree upon a few fundamental standards, a great deal of future trouble would be avoided, and their business would be benefited. The rating of the hob fittings is already approaching uniformity; the sizes and loadings of ovens, the dimensions of plugs and sockets for heating elements, the diameters of boiling plate apertures and the sizes of hobs, could be standardised much more easily now than in a few years' time. If the makers will remember that the important thing is to make it easy for the public to use electric cookers, and will act accordingly, they will do the best for themselves and for the public. What is wanted is team work.

Wireless Waste.

ELSEWHERE in this issue we reproduce from the monthly *Journal* of the British Empire Chamber of Commerce in the U.S.A. some notes on the position and prospects of American trade in radio apparatus. Unhappy results have attended the operations of many wireless traders, especially of the smaller class, on this side of the Atlantic during the last few years, and the *Journal* shows that credulous people in the States have been suffering from the misfortune that has followed the exploitation of the speculative possibilities of the business there. Losses running into many millions of dollars have been experienced by those who put their money into the innumerable new companies. In this country there have been few public issues of capital on the large scale, and those that have taken place have been made on the basis of recorded results which may continue to be satisfactory for a time, but the electrical trade generally is more directly interested in the weekly arrival of new concerns, small it is true in the great majority of cases, and the weekly departure of traders or companies who have not managed to make a success of their operations, thus saddling those from whom they have made their purchases with a substantial volume of wireless bad debts. We may hope with the writer of the notes referred to that sooner or later the business will settle down on to a plain commercial basis. While the possibilities of the trade are still almost unlimited, it must be recognised as one of the inevitabilities that organisations which are badly financed and poorly managed "will pass out of existence," as they ought to do. Unfortunately, the trade suffers as well as the bad managers and the optimistic financiers—perhaps sometimes more so. That is why the movements for the safeguarding of the trade and of the traders of the country should receive support. The radio-apparatus trade has reached immense proportions in a remarkably short time, and that circumstance, together with the great inherent attractiveness and popularity of "listening-in," and the constant technical changes and improvements, have brought quick losses to some and quick fortunes to others. We hear more of the former than of the latter, but that is only natural. That the present situation in the trade is unsatisfactory is unquestioned. The problem is two-fold: the British manufacturer of material asks for the safeguarding of his business against the extremely low-priced competition from abroad; yet while these very cheap lines are in the shop-windows in their thousands, British retailers ask for support for their movement against price-cutting amongst their own class of trader. We published a letter from the chairman of the Wireless Retailers' Association in our last issue, in which the subject of increased trade discounts was discussed, and we now have before us a list of 119 firms of manufacturers who have already agreed to support the movement of that Association for dealing with undercutting. The list is to be officially published, and dealers are invited to place before the Association any price-cutting information that may come before them. It is hardly to be expected that permanence or finality of anything radio can be introduced at this stage, but stability and security for the industry are its most pressing and essential needs.

Problems of Trade and Industry.

INCLUDED amongst our commercial and industrial matter this week is a series of contributions relating to expert investigations of some of the most pressing problems affecting the life of the nation. "The Survey of Overseas Markets" which has been issued by the Balfour Committee on Trade and Industry should be in the hands of every present or prospective export trader. It will be of service to keep on the shelves as a work of reference, but before it is placed there its contents should be digested by those directly engaged in foreign trade activities; trade associations will doubtless make profitable use of it in the interests of their members. The statement by a Committee of the Federation of British Industries on the propositions to introduce subsidies to industries in place of doles to individuals, is interesting. It views any general subsidy scheme with marked disfavour for the very good reason that the progressive manufacturer may be placed at a disadvantage through the assistance rendered to the concern resting in a rut of inefficiency; but it indicates substantial reasons why the principle may be applied in particular industries to the national advantage. The third contribution which the student of industrial subjects will do well to read, is the statement made by the Federation in connection with the findings of its Economic Staff regarding some of the factors which have produced our present trade position.

Municipal Engineers and their Committees.

FEW engineers and managers of municipal electrical undertakings can adopt a definite policy without fear that changes in the *personnel* of the Committee or the Council may imperil its continuity. The most satisfactory systems are those in which the "chief" and the chairman of Committee have kept close company for many years together. Stability, harmony, and progress are possible under such circumstances. The chairman who knows a good engineer when he sees him will place confidence in his technical and other expert recommendations, and the engineer who has a wise and capable chairman knows that he can rely upon sound judgment being brought to bear when his propositions have to be considered from the standpoint of public policy. Nobody who has had an opportunity to study municipal electrical activity in this country at close quarters will suppose that relationships between engineers and their

councillors have always been, or are now, entirely happy. Indeed, there have been plenty of cases where things have been quite otherwise, but it must be admitted that of late one has heard fewer complaints of chiefs being eager to change over from municipal to private service. Perhaps electrical engineers are accorded a higher status than formerly in the local estimation as their undertakings grow in importance; perhaps councillors are more alive to the unwisdom of interfering with the details of operations requiring very specialised training and knowledge that they do not possess; possibly engineers themselves show a more accommodating spirit. But whatever the reason, we believe that discontent is rarer than it once was. We suppose that few things are so hampering to an engineer as uncertainty regarding the mind or the "policy" of his committee. However anxious he may be to make headway, there will be a brake upon his enterprise unless he can rely upon a consistent backing when he gives a sound lead.

The Sydney Engineer and his Aldermen.

In making the above comments, we are moved to express our sympathy with Mr. Forbes Mackay, the city electrical engineer of Sydney, New South Wales, who, if Press reports be correct, has been suffering from the disadvantages which sometimes attend changes in the Council. He complained recently that he was harassed in the performance of the duties of his office by the delays of the City Council in dealing with his recommendations. He quoted specific instances, to which we refer below. After matters had passed the Electricity Committee they were held up by the Council, and the efficient working of the department was hindered. In his criticism he had the support of the Town Clerk, who said that there had been occasions when not weeks, or months, but actually years, had been allowed to elapse before the Council had given its decision. Some of the Labour aldermen waxed indignant at the thought of a mere paid official daring to criticise their action or inaction, but another alderman held that it was in the best interests of the citizens that the senior officers of the Council should be at liberty to bring forward such a criticism if the work of their department was unreasonably interfered with. Mr. Mackay was allowed the special privilege of replying to his critics in the meeting, and from the Press reports to hand it appears that he had no difficulty in combining a full justification of his complaint with a reasonable appeal for the avoidance of delays. The Town Clerk's view was that if departments were to be efficiently controlled the Council must co-operate with the officers in charge of them by dealing expeditiously with the recommendations that they brought forward. But all the publicity given to the matter did not incline the Labour aldermen to drop their hostility, and they rejected Mr. Mackay's report.

Now for aldermen or city councillors to presume that their official position renders them immune from criticism is laughable. In our opinion, Mr. Mackay and the Town Clerk fulfilled a public duty by revealing what had been happening. In 1922, it seems, there was delay in filling the appointment of power house superintendent, and subsequently against the engineer's recommendation it was filled only temporarily. In October, 1924, he recommended the appointment of a "Safety Officer," and that matter had not been dealt with down to May last. Last December he reported a case of indiscipline in the department, but it had not been dealt with in April. Therefore, in the mildest of words, he said: "The work of the officer in charge of the Electricity Department is sometimes made more harassing than seems necessary by delay in finalising matters . . . brought forward by the head of the department."

The hopeful feature of the situation is that the aforesaid aldermen are annoyed that the matter has received so much publicity. The vigilance of the public, if it can be aroused, is a stimulus to efficiency, and that vigilance is frequently aroused by the ventilation of grievances.

An Engineer shall Lead Them.

The Sydney matter is interesting enough in itself, but it will probably give rise to many reflections in the minds of Mr. Mackay's *confrères* in this country who are faced with their own peculiar local circumstances. Everybody recognises that the question whether a borough electrical engineer and manager is or is not head over his own undertaking may depend largely upon personality or popularity. Given a weak man, his committee will manage him and manage his department too,—perhaps mismanage it. If he be a strong, sound, capable man he will co-operate with them if he can, and only manage them if he must. The engineer whose efforts to carry on successfully are deliberately thwarted by his elected employers can only speak in the Council chamber by consent. In the presence of the Council he is required to sit and listen in silence; only at his peril will he rise to his feet, or while seated throw out a hasty remark, impetuously to pay back in their own coin the duly appointed representatives of the people, however absurd their statements or misstatements. It is in the committee-room, or through the medium of his committeemen or other councillors, that he must ventilate his feelings and justify himself. Men have lost their "jobs," or have had to resign before they were ready to do so, after committing the unforgivable sin of taking the floor without permission. We have heard whispers of engineers of strong will and personality who rule their committees as with a rod of iron; others gently persuade them—so much depends upon the committee and so much upon the man. Some officials "sing small," curry favour, and even go against the dictates of conscience, in order to preserve peaceful relations; but they can never hold themselves in very high esteem for so doing—nor does anybody else whose opinion is worth having. On the whole, the courageous course as adopted at Sydney seems to be the right one because it was necessary that somebody should protest when the efficiency of the public service was suffering.

Monorail Trains Again.

Under this heading, with the subtitle "An Old Invention Perfected," a correspondent of the *Morning Post* states that Mr. Louis Brennan has "perfected the gyroscopic monorail system of transport," and quotes the inventor's glowing account of its virtues. We gave some particulars of the system 18 years ago and on later occasions; the fundamental idea is to maintain an electrically-driven coach upright on a single rail by means of a gyroscope. That this can be successfully accomplished is certain, but whether it is a practicable proposition is quite another matter. "All things are possible unto us, but not all things are expedient," and the monorail system, we think, falls in the latter category. We said in 1907: "As a 'scientific toy' . . . the Brennan monorail car is highly interesting; but that is probably the extent of its usefulness" and we have not modified that opinion in the interim.

A monorailway was actually installed in Ireland which did not employ gyroscopes; stability was secured by the use of two auxiliary rails, so that in reality it was a three-rail line. It was abandoned many years ago. On a line which, we believe, is still in operation in Germany, the cars are suspended from a single overhead rail, so that the system is inherently stable. Most extravagant claims were made for the Behr monorailway, which was to have been built from Manchester to London, but that project did not materialise. In point of fact, there is no need for such schemes, no matter how ingenious they be; the sweet simplicity of a track with two running rails and no stabilising mechanism but gravitation renders it immune from attack by any other railway system, and the only competitor that it has to fear at present is the open road. Mr. Brennan is putting forward his system for "Empire development," and does not advocate its use in densely populated countries such as this; his discretion is commendable.

D

Electricity Supply from the Pit Head.

The Pooley Hall Colliery Co.'s Undertaking.

A GREAT deal has been said in recent years regarding the advantages of generating electricity at the pit-head instead of carting coal to a large number of generating stations situated at varying distances from the coal areas. While it has not been decided whether this would really effect the anticipated economies if carried out on a large scale, the principle has been adopted with success in a number of smaller instances.

One case which has been recently brought to our notice is that of the Pooley Hall Colliery Co., Ltd., which is supplying electricity to the town of Tamworth, Staffordshire. Just over a year ago a committee of the Town Council was appointed to consider the question of a supply of electricity for the borough. The company then offered to provide the whole of the necessary capital and contract with individual residents for a supply to them. The Corporation accepted this proposal, with a provision that it should be able to take over the scheme at any time after the expiry of four years from the signing of the formal contract with the company.

Fig. 1.—The Pooley Hall Colliery.

The undertaking was formally inaugurated on October 1st last year, and has since been forging ahead. Fig. 1 is a general view of the Pooley Hall Co.'s colliery; the interior of the power house is illustrated in fig. 2. The company is devoting special attention to the development of the domestic load. It has a very attractive rate for electric heating and cooking (1¼d. per kWh), and has recently instituted a scheme for the hire of cooking equipment at reasonable quarterly rates varying from 6s. for a large cooker to 1s. 6d. for a grill. In order to bring this scheme before the public of the district an electrical exhibition was recently organised. In this matter the company had the benefit of the assistance of the Credenda Conduits Co., Ltd., whose apparatus is being employed under the scheme. As a result of the exhibition, orders were booked for a total of 132 cookers, and it is possible that another 40 will be required in connection with a local housing scheme.

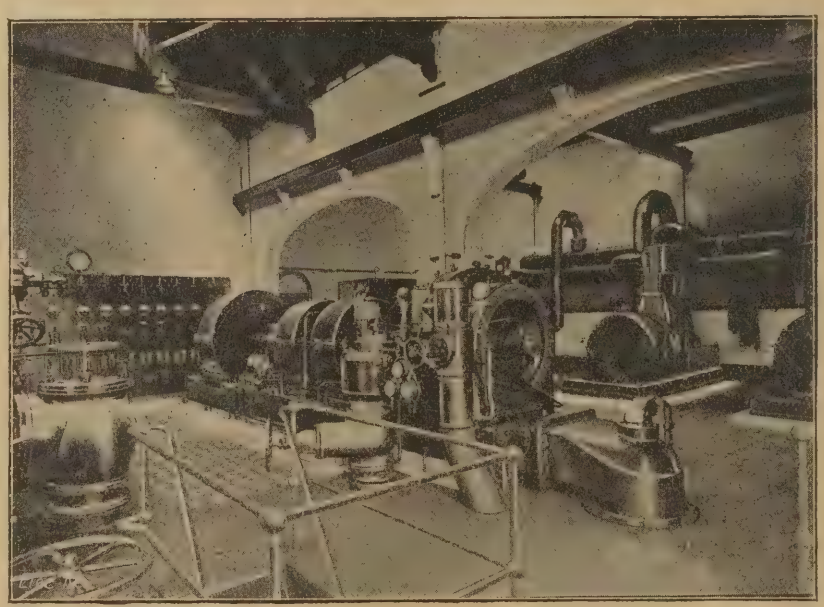

Fig. 2.—The Pooley Hall Power House.

The exhibition is illustrated in fig. 3. In addition to the Credenda Conduits Co., whose display is seen in the background, a number of leading electrical companies held stands. Reference is made to these in our "Business Notes" section. There were also two special exhibits, one of which was a "Hopkinson" electrically-driven coal-cutter, as used at the Pooley Hall Colliery, and the other an exhibit of applications of electricity to farming.

Fig. 3.—A View of the Tamworth Exhibition.

At the opening ceremony, Col. Chaytor, the chairman of the company, outlined the purposes of the exhibition, and mentioned the company's hiring scheme. The Mayor of Tamworth said that the rate for heating and cooking was a great concession for a town of the size of Tamworth. He congratulated the company on having connected up nearly 1,400 consumers since the inauguration of the supply.

The accomplishment of the company is indeed a matter for congratulation when it is seen from the last "Municipal Year Book" that the population of Tamworth is only just over 8,000. Not many towns can show such a large proportion of electricity consumers.

The Science Exhibits at Wembley.

The Royal Society's Display in the Government Pavilion.

(Concluded from page 85.)

The Atom.

Sir Joseph Thomson, O.M., F.R.S., is showing pparatus by which the existence of electrons was de-ected and their mass and velocity measured, and Sir rnest Rutherford, O.M., F.R.S., deals with some spects of radio-activity and their bearing on atomic tructure, including the production of radium emana-ion; the discovery of the nature of alpha particles, ounting and scattering them; and the artificial disin-egration of elements, &c. Mr. D. R. Hartree exhibits odels, made at the Manchester University physical aboratory, illustrating atomic structure.

Clarendon Laboratory, University Museum, Oxford Prof. F. A. Lindemann, F.R.S., Mr. T. C. Keeley, nd Mr. E. Bolton King) demonstrates a method of aking audible the movement of α- and β-particles n an electric field. Owing to the larger mass of α-articles, as compared with β-particles (7,000 to 1), oth of them, in spite of the difference in speed, possess uch the same energy. When one of these particles trikes an atom, it usually breaks off one or more of the uter electrons, leaving the mutilated atom (or ion) ith a positive charge. In an electric field these ions ove, thus transferring charge and thereby forming an lectric current. If the field is strong enough, the velo-ity of the ions rises to such a high value that they hemselves can break electrons off other atoms, forming ew ions which in their turn repeat the process. In his experiment, so powerful a field is maintained be-ween the two electrodes, that the ions formed by one ingle α- or β-particle produce sufficient new ions to ive a momentary current, which, when amplified, orks a loud-speaker.

Slow Oscillations.

The apparatus exhibited by the N.P.L. (Mr. D. W. ye) in this section consists of a triode generator of udio-frequency currents, a resonant circuit and various ndicating devices; currents from this source are made o flow through an inductive coil, and the resulting agnetic field is used to demonstrate resonance and elective absorption, and heating, directive, and coustical phenomena. The G.E.C. research labora-ory shows thermionic rectification, including an xperimental high-power rectifier for use on a 30,000-olt supply; the copper anode is cooled by a water acket, the electron emission from the filament being ver 5 amperes.

Gamma- and X-rays.

Mr. F. D. Edwards illustrates the beautiful effects btained by passing an electrical discharge through a ft. 6 in. glass tube during reduction from atmospheric ressure to high vacuum. A number of Crookes' and ther tubes are shown.

The National Physical Laboratory (Dr. E. A. Owen) emonstrates the penetration of metals by X-rays, and r. G. W. C. Kaye shows visually the relative trans-arency to X-rays of some half-dozen elements ranging rom carbon (graphite density 1.6) to lead (density 1.4), while the Röntgen Society has arranged a display f historic X-ray tubes selected from the collection at the cience Museum. Sir W. Bragg, K.B.E., F.R.S., llustrates the analysis of crystal structure by X-rays ith the aid of his ionisation spectrometer, a Müller pectograph and models representing the arrangement f the atoms in crystals.

Ultra-Violet Rays.

In this section the Clarendon Laboratory, University Museum, Oxford (Prof. F. A. Lindemann, F.R.S., and Messrs. T. C. Keeley and E. Bolton King) shows Schu-mann X-rays. The energy of electrons ejected from metals under the influence of radiation is equal initially to the energy of the quantum of the radiation concerned; this quantum is simply proportional to the frequency, so that red light ejects comparatively slow electrons, whereas violet light ejects electrons of twice the energy, or $\sqrt{2}$ times the velocity. If the metal exposed to the light is insulated, on losing electrons it acquires a positive charge which attracts the electrons and tends to slow them up, ultimately, when the charge is high enough, preventing them from escaping altogether. Hence, an insulated piece of metal will acquire a charge proportional to the frequency of the incident light. It is shown that an insulated electrode connected to an electrometer acquires a charge of some three volts when exposed to visible light. When exposed to radiation produced by stopping electrons the velocity of which corresponds to a potential drop of some hundred volts, the electrode charges up to a potential of the same order as that producing the radiation. Under the influence of X-rays, the electrode charges up to thousands of volts, and the radiation shown in this experiment is therefore of a frequency intermediate between X-rays and the ultra-violet. This is the region of the spectrum which in ill-informed circles is said to include the "death-ray." The whole experiment has to be carried out in a vacuum, as the slightest trace of air entirely absorbs radiation of this frequency.

Visible Rays.

The exhibit of the Clarendon Laboratory, Oxford, under this heading is designed to show that the emission of electrons under the influence of light, *i.e.*, the photo-electric effect, can be applied to a large number of scientific and industrial uses which involve comparison and measurement of light intensities, while Mr. T. H. Harrison indicates the method of colour matching that has been developed by the G.E.C. research staff and is being adopted at the N.P.L.

Prof. F. Horton, F.R.S., and Dr. Ann C. Davies show the excitation of the spectra of gases by electron impacts. The apparatus consists of a small glass vessel supported between the poles of an electromagnet. The vessel contains the gas to be experimented upon at a low pressure, usually a few tenths of a millimetre, and sealed into it are two parallel, lime-coated, platinum filaments which are heated electrically, one at a time, and supply the electrons for the bombardment of the gas. A short distance beneath the two filaments a circular grid of fine mesh platinum gauze is situated, while a circular disk of platinum is placed parallel to and concentric with the grid at a distance of about 1.5 cm. from it. The electrons from the filament are accelerated towards the grid by means of a potential difference supplied by a battery connected to these two electrodes outside the apparatus. Some of the electrons pass through the interstices of the gauze into the space between the grid and the disk, where they collide with gas atoms. The production of luminosity results from the recovery of the atoms after such impacts, and the magnetic field in which the apparatus is situated concentrates the luminosity into a bright central column between the grid and the disk; by watching for changes in the spectrum of the luminosity as the potential difference applied between the filament and the grid is gradually increased, the voltages necessary for the excitation of different groups of lines can be determined. For such an investigation, the grid and the disk would be connected together outside the apparatus.

Solar and Terrestrial Radiation.

This exhibit constitutes a link between the purely physical and geophysical sections, and is arranged to illustrate recent British contributions to meteorology, terrestrial magnetism, and atmospheric electricity (Dr. C. Chree and Mr. C. S. Wright) and seismology.

Conclusion.

In the botany section Prof. V. H. Blackman, F.R.S., shows electrical apparatus for determining the amount of water lost by a potted plant in the process of transpiration and for recording the rate of growth, while Dr. E. D. Adrian, F.R.S., has on view a selection of electrical measuring devices for research in physiology. The undermentioned firms have provided instruments and apparatus for demonstration purposes:—B.T.-H. Co., S. G. Brown, Ltd., Cambridge Instrument Co., Cox-Cavendish Co., Dubilier Condenser Co., Edison Swan Co., W. Edwards & Co., G.E.C., Adam Hilger, Ltd., M. O. Valve Co., Marconi's Co., Metropolitan-Vickers Co., Mullard Radio Valve Co., W. G. Pye and Co., Siemens Bros., H. W. Sullivan, Ltd., H. Tinsley and Co., Watson & Sons (Electro-Medical), Ltd., and the White Electrical Instrument Co., Ltd.

The Errors of Potential Transformers.

By G. W. STUBBINGS, B.Sc., A.Inst.P.

IN a previous article the writer dealt with the determination of the errors of series transformers by comparison with a standard transformer having known errors, and using apparatus of a kind found in test rooms of moderate size.* The method of comparison is very suitable for the determination of the errors of single-phase potential transformers, and the present article deals in detail with the conduct of such tests. It is assumed that there is available a standard potential transformer of identical ratio with that of the transformer to be tested, the errors of which are known when loaded with a voltmeter and a wattmeter potential coil. A single-phase induction meter can be substituted for the wattmeter if desired, and this will be quite suitable for the quadrature adjustments.

The errors of potential transformers are, as a rule, much smaller than those of series transformers, in that the applied voltage is practically constant, and the condition corresponding to a relatively small fraction of full-load current of a series transformer does not obtain. The secondary voltage will always be less than the primary voltage divided by the turns ratio, but it is possible to compensate for this ratio error for a given secondary burden with great exactitude by adjustment of the number of primary turns. The phase shift of the secondary voltage cannot, however, be corrected, nor is the direction of this

Fig. 1.

phase shift almost invariable as is the case with a series transformer. Referring to fig. 1*a*, we here have the vector diagram for a transformer with a non-inductive secondary burden. The exciting current i_e may be comparable in magnitude with the secondary current i_s but, as it traverses the primary winding only, it may be taken to cause one-half the drop of a similar current in the external circuit. The impedance drop in this case leads the secondary voltage, and the phase error of the transformer is lagging. In fig. 1*b* the secondary burden is inductive, as would be the case with the pressure circuit of an induction meter. In this case the lead of the impedance drop on the total equivalent current is less than the lag of this current and the primary vector lags the secondary.

The principle of the method of comparison will be clear from a consideration of fig. 2. The standard and the test transformers are each excited from the same e.h.p. voltage, the secondary of the former being connected to a voltmeter and a wattmeter, the latter being connected to its normal burden. The difference voltage is impressed on the potential coil of a second wattmeter, which can be excited by currents in phase with, or in quadrature with, the secondary voltage of the standard transformer. If w_1 i_1 and w_2 i_2 be the watts and current corresponding to these conditions with a secondary voltage v_s, then it is easy to see that the difference in the percentage ratio errors of the two transformers is $100w_1/i_1\ v_s$, and the difference in their phase angles is $w_2/i_2\ v_s$ radians or $57.3\ w_2/i_2\ v_s$ degs.

The diagram of connections, fig. 4, shows how this test can be carried out without the use of any special apparatus, and there are only one or two points requiring comment. The e.h.p. supply to the two trans-

Fig. 2.

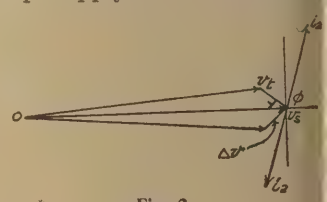

Fig. 3.

formers will probably be obtained from a third potential transformer inverted. The volt-ampere loading of the step-up transformer will not only include the secondary loads of the two transformers being compared, but also their exciting currents. There may, therefore, be a considerable drop in the step-up transformer, resulting in a h.p. voltage well below normal. If the iron of the transformers is worked near saturation, the exciting current may be comparable with the load current, and, moreover, the magnitude of the exciting current will be very sensitive to voltage changes. For this reason it may be necessary to give a small boost to the h.p. voltage on the transformers being compared, so that normal pressure, as indicated by the voltmeter connected to the standard transformer, is obtained. The method of boosting, by the use of an auto-transformer with a number of taps, is easily understood from the diagram. Failing an auto-transformer, some sort of potentiometer connection can easily be arranged to give the required boost, care being taken that the boosting voltage is from the same phase as supplies the h.p. side of the step-up transformer.

The method of obtaining the exciting currents for the difference wattmeter calls for a few remarks. From the diagram it will be seen that a 3-phase supply is available, and a bank of lamps, connected in star, is used to obtain the required currents. The position of the star point can be varied, by means of a slider rheostat, to obtain zero reading on wattmeter W_1, this indicating that the exciting current is in quadrature with the voltage v_s. To obtain the in-phase current, one leg of the star is switched out, the remaining legs of the star being in series across the phases supplying the step-up transformer. Provided there is a negligible phase shift in the step-up transformer, the exciting current so obtained will be nearly in phase with v_s. This can be tested in the following way: When the quadrature adjustment has been made, the potential on W_1 and V is

* ELEC. REV., April 18th, 1924.

changed over to the supply to the step-up transformer. If v_s, i_s, w_s are the watts, current, and voltage respectively under these conditions, $w_s/i_s v_s$ will give the sine of the angle of phase shift, and, if necessary, the determinations of ratio error difference can easily be corrected for the departure of the exciting current from the in-phase condition. Regarding the ratio test, it need hardly be said that the pressure circuit of w_1 should be opened before switching over the exciting current, if this be above the full rated current of the instrument.

The accuracy obtainable by this method is usually greater than with the corresponding method for series transformers, as only one voltage has to be dealt with, and this will usually be the full rated voltage of the wattmeter. If double full load current can be used for wattmeter excitation, 0.2 per cent. of the full scale reading on w_2 will correspond to a voltage difference of 0.1 per cent. Thus, differences in ratio error of 0.1 per cent., and of about 3½ minutes of phase angle, are easily observable with a suitable wattmeter.

The readings of the difference wattmeter will not indicate whether the errors of test transformer are greater or less than those of the standard. The direction of the difference can be determined by temporarily switching on to the test transformer a considerable extra non-inductive load, say, a 100-V 32-c.p. carbon-filament lamp and observing the effect on the difference wattmeter reading. The additional load will diminish the secondary voltage, and if therefore, for the ratio test, the reading of w_2 is increased by this extra load, this will indicate that the secondary voltage of the test transformer for the normal burden is less than that of the standard. If, however, the reading of w_2 is diminished or reversed, the standard transformer will have given the lower voltage. The same procedure applies to the phase error test. The effect of the non-inductive burden is to cause a lag of the secondary voltage. If, therefore, the connection of the additional load diminishes or reverses the reading of w_1, the test transformer voltage will have been leading that of the standard, and *vice versa*.

Modification of the connections to suit a 2-phase supply will not be difficult. It will, however, not be easy to obtain sufficient current in quadrature with the supply voltage when only a 1-phase supply is available, unless additional complications are introduced. If, however, by the use of choke coils the maximum permissible current of the wattmeters can be obtained with a lag of over 60 degrees, the phase error can be obtained easily by a short additional calculation. When the difference wattmeter is excited by the lagging current, the readings of w_1, V and A will enable the angle of this lag, ϕ, to be determined. Fig. 3 is the vector diagram for these conditions, i_2 being the exciting current of the wattmeter. The reading of w_2 is then given by—

$$w_2 = i_2 \triangle v \ (\sin \gamma \sin \phi \pm \cos \gamma \cos \phi).$$

The positive sign applying when v_t lags v_3 and *vice versa*, then $w_2/i_2 v = a \sin \phi \pm r \cos \phi$,

where a is the true phase angle difference in radians, and r is the ratio fractional difference as determined by the in-phase test. From this expression, a can be calculated, but the correction for the phase shift, if any, of the step-up transformer will be more difficult to make. The effect of an additional non-inductive burden will be to increase the lag of v_t and to diminish the reading of w_2 if the voltage of the test transformer leads that of the standard—the same rule applying as when a true quadrature current is used. The effect of the additional load will enable the requisite sign of $r \cos \phi$ in the above expression to be obtained.

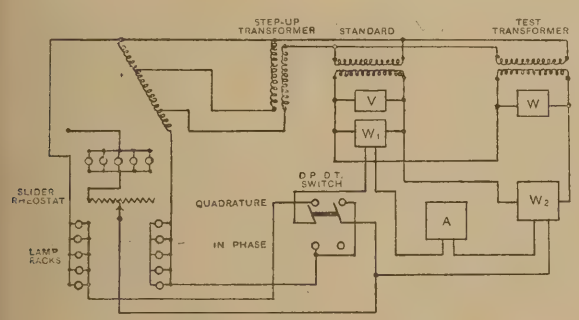

Fig. 4.

The effect of h.p. protective resistances on the errors of potential transformers can easily be determined by the method described above. If, however, the characteristics of the secondary burden and of the exciting current are known, these effects can easily be calculated. If the secondary current be i_s and its phase angle θ, the exciting current referred to the secondary i_e, with a phase angle β, and R the total resistance in series with the transformer, the phase error is $\frac{R}{n^2 v_s}(i_e \sin \beta + i_s \sin \theta)$ radians, the voltage on the transformer leading the supply voltage.

The ratio error is—

$$\frac{100R}{n^2 v_s}(i_e \cos \beta + i_s \cos \theta) = \frac{100R}{n^2 v_s}(w_e + w_s),$$

n being the ratio of transformation, and w_e and w_s the exciting and secondary watts respectively.

The case of three resistances for two potential transformers connected in open delta is not so simple, since the current in the resistance in the common lead is not in phase with that in the others. Knowing the ratio and phase errors occasioned by a single resistance in series with the primary, it is easy to calculate the total effect of the two resistances in circuit with each transformer. If r be the ratio error of the single resistance expressed as a fraction and not as a percentage, and a the phase angle in radians, then for the blue transformer, the equivalent errors are given by—

$$\text{Phase error} = \left(\frac{2+\sqrt{3}}{2}a + \frac{r}{2}\right) \text{ radians},$$

$$\text{Ratio error} = 100\left(\frac{3}{2}r - \frac{\sqrt{3}}{2}a\right) \text{ per cent.}$$

For the red transformer—

$$\text{Phase error} = \left(\frac{2+\sqrt{3}}{2}a - \frac{r}{2}\right) \text{ radians},$$

$$\text{Ratio error} = 100\left(\frac{3}{2}r + \frac{\sqrt{3}}{2}a\right) \text{ per cent.}$$

Referring again to fig. 1, it is readily seen that if the resistance and impedance of the transformer are known, in addition to the data regarding exciting and secondary currents, the total phase error of a single-phase transformer can be calculated from the formula—

$$a = \frac{z}{v}\left\{\frac{i_e}{2}\sin(\beta - a) + i_s \sin(\theta - a)\right\} \text{ radians},$$

z being the impedance of the transformer with a phase angle a and β the lag of the exciting current. The impedance data can be obtained by ordinary short circuit and resistance tests, if instruments of the required ranges are available. Unless the exact turns ratio is known, it is not possible to obtain the ratio error directly by this method.

B.E.S.A. Specifications.—The British Engineering Standards Association has issued the following specifications:—

No. 218, 1925, for brass bars and sections suitable for forgings and drop forgings. The copper content of this material is specified to be not less than 58 per cent., and the minimum tensile strength 20 tons per square inch with an elongation of not less than 25 per cent.

No. 219, 1925, for soft solders. This covers nine grades of tin-lead solder intended for electrical purposes, tinsmiths' and coppersmiths' work, steel tube joints, lead cable wiped joints, &c. Typical purposes for which the various grades are particularly suitable are mentioned in the table of analyses.

Copies of these new publications can be obtained from the B.E.S.A. Publications Department, 28, Victoria Street, London, S.W.1, price 1s. 2d. each, post free.

Electricity at the Royal Agricultural Show.

Practical Demonstrations of Electrical Methods of Farming.

(*Continued from p. 86.*)

The main purposes for which electric power was demonstrated on the Chester showground in connection with farm pursuits were: refrigerating, milking and milk cooling, corn grinding and milling, conveyors, ploughing, mole draining, cultivators, winnowing, barley dressing, seed cleaning, churning and separators, thrashing machinery, water pumping, pasteurising, barn machinery, bottle washing, bacon slicing, oil refining, crop drying, lighting, heating, fans, and for general purposes.

The Institute of Agricultural Engineering of Oxford University aroused great interest by the employment of electric power for driving a blower which forces hot air into a stack of green material such as grass or cereals, for the purpose of artificial drying. The power consumed for this purpose is in the neighbourhood of 20 h.p. This demonstration shows the convenience of the use of electricity for this purpose. Tractors can also be used for the work, but where electric power is available, it is much better, on account of its being more reliable than the ordinary tractor, and free from fire risk.

An Electro-Farming Conference.

On the second day of the Royal Show an Electro-Farming Conference was held. The attendance of agriculturists was poor, having regard to the importance of the subject to be discussed and the expertness of the various speakers. Lord Bledisloe presided and said that the Conference had been called by the Electrical Development Association at the suggestion of Mr. R. Borlase Matthews. If their Continental and Transatlantic competitors were using electricity with good results, then British agriculturists would have to do the same, to improve the economic condition of agriculture in this country. Even the up-to-date experienced and enlightened farmer would approach the subject cautiously. He asked to be satisfied that electricity on the farm was a sound commercial proposition, likely to be profitable to him. It might be suggested that conditions were quite different in this country from what they were in Denmark and South Sweden, where electricity provided the bulk of the power, but it had to be admitted that this form of power was useful for a greater number of purposes than had been yet conceived. As an agriculturist, he felt that farmers had to move cautiously, but at the same time move forward. He had electricity on his farm for the purpose of grinding barley for his pigs, and he was now installing power for the mixing of pig foods. He calculated that the latter machine would save the services of one and a half men, and do the work more efficiently.

Mr. S. E. Britton then opened the discussion with a short paper on the use of electricity in agriculture, of which the following is an abstract:—

It is the custom of the Royal Agricultural Society to invite competition at its annual shows in specified classes of implements. These trials serve to direct the public mind to the development of the mechanical aids to agriculture which is continually in progress. Up to now the Society has not seen fit to invite competition involving the aid of electricity in agriculture. This meeting may be the means of a change in that direction. As each new form of power is evolved the question of its application to agriculture invariably follows, the inference being that the farmer is not satisfied with manual and horse power, and thinks there will be a more suitable substitute at his disposal ultimately.

There is a growing number of people who think that electricity will eventually be the power used on the farm. Whatever be the inherent good in associating electricity and agriculture, progress will be difficult, slow and costly, so long as there is no established route whereby the farmer and the electrical engineer can approach this subject on equal terms.

Although it has been possible to obtain powers to supply over wide areas both in bulk and to authorised distributors since 1900, very few supply authorities have attempted to supply in rural areas. Electricity cannot be taken into such areas by any other means than overhead lines if the supply is to be given at cheap rates, and every obstruction to the granting of consents tends to increase the cost and the price at which electricity can be sold. In negotiating wayleaves, distributing authorities must give the utmost consideration to the wishes of the land-owner and the occupier, and the purpose the land is put to.

Briefly, the present condition of the electricity supply industry, and the use of electricity in agriculture, is as follows:—

1. The Electricity (Supply) Act, 1919, enables electricity to be taken into the rural districts.
2. The conditions governing the setting-up of Distribution Authorities are not satisfactory or conducive to the most economical supply being given in rural districts.
3. There is an economic problem to be solved, to enable electricity to be transmitted from the source of supply to the potential users in the rural districts.
4. The Electricity Commissioners' Rules and Regulations governing the construction of overhead transmission and distribution lines set up too high a standard of perfection, thereby increasing the cost of overhead lines.
5. There is no technical or engineering problem to overcome in the application of electricity to the homestead for lighting, heating, cooking, and power in the house, the dairy, the shippon, the barn, the hen-house, the yard, and for the supply of water.
6. Practical demonstrations of electricity on the land for ploughing, cultivating, reaping, and the treatment of crops, have already been made. The results obtained, if not absolutely perfect, promise an early solution and the development of suitable electrical apparatus for such operations.
7. Electroculture is an extremely fascinating subject. It is being carefully explored by scientists, in the hope of developing something practical for the farm.
8. The cost of generating and distributing electricity under specified conditions is not difficult to ascertain. It is important to know how much the farmer can afford to pay for electricity for the various uses to which it can be economically applied. When that is ascertained a suitable tariff can be formulated.
9. There is a lack of co-operation between the agriculturist, implement makers, and the electrical industry. An organisation to bring them together is urgently needed.
10. Experience has shown that there is no visible limit to the application of electricity to all purposes. But hitherto electricity has not been called upon to take its place in the attempt to solve such problems as the intensive cultivation of the land, or to secure the stability of the noblest of industries, agriculture.

In the discussion Sir John Russell said that it was for the electrical engineer to bridge the gap now existing between the position taken up by the agriculturist and that of the electrical engineer. The latter had to bring his inventions down to the level at which they established contact with the farmer. For domestic purposes, lighting, power, heating, the pumping of water, the working of bacon factories, dairies, light railways, &c., the advantages of electricity to the agriculturist were so obvious that all that had to be done was to solve the problem of how to get the electricity where it was wanted. A second group of problems involved the use of power for traction purposes, operating cultivating implements, driving machinery in barns, and so on. Finally, there was a group of problems which, as yet, had not emerged from the laboratory; he referred to the electrical treatment of crops, the sterilisation of milk, the drying of crops, &c. With regard to the use of electric power on the farm, whilst the problem might have been solved from the engineering point of view, he was not satisfied that it had been from the farmer's point of view. Engineers should remember that farming devices were not worked by men of a mechanical turn of mind: they were accustomed to dealing with animals. Electrically-operated machinery intended for the farm must embody certain features which, to the skilled engineer, might appear unnecessary. The farmer had an incurable habit of leaving his machines out-of-doors and not lubricating them; electrical engineers had to think in terms of the men who were addicted to these habits. Again, electrical machinery must be flexible. If comparison were made between the cost of a unit of power, electricity and horse—electricity had an enormous advantage, yet the farmer continued to make great use of the horse. At Rothamstead it had been shown that the cost of ploughing an acre of land by tractor was considerably less than by horse: yet the horse was not being displaced to any great extent by the tractor. There was a time after the war when the tractor went ahead, but now there was a tendency for the horse to come back again, because the horse was a flexible unit which could do many classes of work. It would take a great deal of work on the part of the engineer to get the farmer to adopt electricity sufficiently to cope with the harvest and yet be able to employ it generally during the year. Electricity must be cheap. Farm machinery was not in use all the time. There might be weeks when it was lying idle, and the farmer could not afford to incur a big outlay on plant which did not show the probability of an early return. It was obvious that some jobs about the farm could very well be done, and would be done by electricity, and he expected considerable developments as soon as power was available. He referred specifically to machinery for cake

breaking, root-cutting, and other tasks which had to be done daily, regarding that as the most hopeful line of approach. Farmers usually hired thrashing machines, but there was a tendency for them to acquire their own instruments, and that held out the possibilities for an increasing use of electricity. He was not so hopeful with regard to the use of electricity for cultivating purposes. Farmers had to face the unknown factor of depreciation in expensive electrical equipment. In the use of tractors for ploughing purposes, depreciation turned out to be much heavier than was expected. It was a problem to which engineers must devote attention. The application of electricity to the drying of crops was now being studied; experiments had been made on a number of farms. This was a thing to watch, but not to advocate yet to farmers. The use of electricity for stimulating crop growth had been studied in great detail at Rothamstead. There had been increases in yields up to 20 per cent., but they did not know how these results were obtained. They could never say beforehand whether an increase could be obtained or not. They did not know when to apply electricity, or how long, or whether to apply a.c. or d.c. The possibility of reducing friction in ploughing by the use of electricity had been engaging attention, and favourable results had been attained. Engineers should bear in mind all the time that farmers had an economic problem to solve. As soon as it was directly obvious that electricity was cheaper and better than power from oil engines, they might expect to see progress.

Mr. BORLASE MATTHEWS said that on his 600-acre farm there were 67 applications of electricity, and he had only two horses. In the agricultural industry there were 200 applications of electricity. He thought they were at the beginning of an electrical era in agriculture. On the farms of the world there were nearly one million farmers using electricity; in this country there were only 400, but he hoped that within a year this number would be doubled. Electricity was used largely in every national industry except farming, and he considered that its possibilities in that connection should be investigated to determine how far it could be successfully applied. He agreed that the problem was a commercial one. One of the main avenues for the employment of electricity on the farm was for the lighting of stock sheds. It saved time every day. On dairy farms it paid to have electric light; in a good light there was less milk spilt. The daily spillages in time amounted to more than the cost of a good installation. At the present time there were 50 poultry farms using electric light, and they had registered results 43 per cent. better than when none was employed. There were also possibilities in electricity for the market gardener. When seedlings were transferred they were apt to fall down and become wilted next day; he had found that, when electric light was applied overnight, the seedlings became fresh and vigorous next morning—in fact, they developed a week's growth overnight. Plants in this way could be brought forward in a wonderful manner. Daffodils had flowered in four days and narcissus in seven days. The application of electric light had accomplished three or four weeks' growth in four to seven days. The first thing the farmer should do was to equip his chaffing machines with power. Some farmers were also employing centrifugal dust extractors; the extraction of this small dry dust was much better for stock. For the pumping of water electricity might also be usefully employed, and when a supply could be delivered at a pressure of 30 to 40 lb., instead of the ordinary farm trickle, the benefits to the farmer were obvious. In the installation of plant, he agreed that the farmer required robust machinery, but this was already available in the squirrel-cage induction type motor, which did not demand much attention. There were two forms of electric motor—(1) the industrial motor and (2) the agricultural electric motor. The latter had been designed so that it could be safely left out in the open, and it could always run when the farmer wanted it to run. The life of the industrial motor was a long one; some little time ago he was on a farm where the farmer told him that his motor had been running 25 years, and he bought it second-hand then. Electricity was not, and never would be, used simply because it was electricity; it had to be shown that it was cheaper and better than any other form of power. The farmer was essentially a business man, and it was open to remark that there was no business in which there were so few bankruptcies as in farming. The farmer in the past had been often imposed upon by inventions which purported to do what they did not; hence the farmer now proceeded very cautiously, and, before associating himself with revolutionary devices, had first of all to be assured that he was on safe ground. That was one reason why the electrical engineer had to get into closer touch with the farmer to ascertain his precise needs.

Mr. J. W. BEAUCHAMP, director of the Electrical Development Association, mentioned that it was hoped to arrange similar electrical conferences in different parts of the country. He believed that there was an electrical appliance for every job on the farm.

Mr. HOWARTH, an agriculturist who is now using electricity on his 400-acre farm, said that the farmer was mainly concerned with the economic possibilities of various forms of power, and many of them were coming to realise that electricity was cheaper than either oil or gas engines. He had been using electricity for several years, and since becoming connected to the Chester Corporation supply system he had been surprised at the great economies which had resulted.

Mr. C. T. ALLAN, of the South Wales Electric Power Co., said that in South Wales the mains passed a lot of farms, 200 of which were connected, most of them being of about 50 acres. His method of approach was not to the farmer but to the housewife, who, after all, was the hardest-worked person on the farm. They endeavoured to interest her in electric light, electric ironing, electric washing, and so on. After that they tried to get the farmer to install a 3-h.p. chaff cutter. As regarded ploughing, he thought that the local supply authority should undertake to plough fields on contract.

Mr. G. YOSHIDA, electrical engineer, of Tokio, gave particulars as to what had been done in Japan in connection with electric farming.

Mr. WALKER, a member of a firm of farming implement manufacturers, said that if progress was to be made in electric farming, there must be co-operation between the electrical engineer, the manufacturer, the farmer, and the supply authority. In the United States there were experimental electric farms. A similar venture should be made here.

Sir JOHN RUSSELL supported this idea. He suggested that engineers should equip a dairy farm and let it be worked by farmers, in order that engineers might ascertain and adequately appreciate the attitude of the agriculturist.

(To be continued.)

Correspondence.

Correspondents should forward their communications **at the earliest possible moment.** *No letter can be published unless we have the writer's name and address in our possession.*

American Underwriters' Laboratories.

Through absence from England I have got rather behind with my reading, so have only just seen the Editorial on "Standards of Quality and Performance" in the ELECTRICAL REVIEW for July 3rd, and the request therein for particulars of the experience of any reader with the Underwriters' Laboratories of the U.S.A.

As I believe the matter is one which should be of general interest to British manufacturers, I am glad of this opportunity of giving the experiences I have had in connection with the time switch business in which I am interested.

It was in 1911 that I first came up against the Underwriters' Laboratories. I use the words "up against" intentionally because that is exactly how I felt when faced with the discovery that I could not sell in a British Dominion—Canada—without the approval of an American concern. It roused my British pride and I felt very defiant about it, but my Canadian friends rightly pointed out that as our English insurance companies had handed them over to American offices, they had to comply with the latter's requirements and were not going uninsured just to please their own, my, or anybody else's patriotism. It is as well for us all, over here, to understand this point of view, as it will save a lot of ruffled feelings.

Having recovered from this first antagonism, my next shock came when my firm submitted for approval a time switch that incorporated a tumbler switch. To an Englishman, brought up on tumbler switches, it came like a bolt from the blue when I was told that such switches were not allowed. This perhaps points to one of the dangers of a National Proving House—it may become more national than proving. I suppose, at the time of which I am writing, I was not the only one having a dig at the Underwriters' Laboratories. I seem to remember Messrs. Berry Skinner having a tilt at them. Anyway, they proved themselves quite reasonable people and Mr. Dana Pierce, now their president, came over here, studied things on the spot, and appointed Messrs. Heap & Digby to represent them and test for them any British goods submitted. One outcome was that tumbler switches are now not unknown in the States, where they were soon being advertised as a great discovery. Another was that we got our time switches approved and, in general, things went along very smoothly as far as I know. Since the war, Messrs. Heap & Digby have ceased to handle this business and I have found it rather a difficulty to get approvals through. This, however, I am bound to say is not due to any obstacles put in the way from the other side, but rather to slackness and lack of common sense, or technical ability, on this. My first thought was that the B.E.A.M.A. would like to take action for the common good of its members, but it declined. In the end, the Underwriters' Laboratories deputed the Fire Offices Committee here to make the tests, we supplying current, instruments, and other facilities—not an easy matter where, as in this instance, a current of 300 amperes at 500 volts, d.c., had to be switched on and off 50 times at the rates of six times per minute. For special cases (and this happened to be one of them) there are no cut and dried rules, and rules relating to the nearest apparatus are taken as a general basis. This is where I found on this side a want of understanding and reasonableness which makes me hope that if ever we have a proving house in England it will not be under the control of the fire insurance people. For any further approvals I may want, I should send the articles straight out to the States, where they have the facilities for testing almost anything electrical and do not seem to be unreasonable in their requirements.

In general, I am not enamoured of the proving house idea. I have already given some reasons—and fears—but the main point, and one on which I think all manufacturers will be agreed, is that it will either stop progress or be generally disregarded. We never really reach finality in manufacturing; always there are little alterations being made—different materials being used, slight re-arrangement of parts and similar changes in materials, methods and design—so that very few articles would be as per sample submitted by the time the approval came through. Are we, therefore, to stand still lest we incur the rejection of our goods because a letter-of-the-law official notices a cheese-headed screw where a rose-headed one occurs in the approved sample?

Your hope that a "Proving House would furnish a very much more effective protection of British manufacturers against cheap foreign accessories" I am afraid would not be realised. "Approval" never has been, and, I think, never will be, a guarantee of satisfactory operation.

I hope I have made it clear that so far from finding it "almost, if not quite, impossible for a British or other manufacturer to secure the services of the Bureau," I have always experienced courtesy and fairness from the Underwriters' Laboratories. That there are difficulties cannot be denied, but these are due to the differences in ideas that one finds between one country and another. For instance, we have to use a type of terminal to comply with their requirements which we do not think is so good as our English standard. Possibly if more British manufacturers were involved, or the B.E.A.M.A. were interested, conditions might become easier.

Ernest E. Sharp.

London, S.W.1, *July 17th*, 1925.

Is There an Age Limit?

I have read with interest the letter in your issue of July 10th, by Mr. L. P. Ives, on the question of age limit, in connection with the procuring of appointments in the electrical profession. My advice to Mr. Ives is to keep it as dark as possible about his thirty-three years' experience when applying for posts. What seems to be wanted nowadays by most employers in the electrical trade is a young man who has had practically no experience whatever, and who has never held a really big post in the electrical profession, but is "full of beans," and open to take a post only fit for an experienced man at a salary about half the figure the experienced man deserves and is well worthy of. No doubt quite a number of such youngsters fill the bill, but even if they don't, it does not worry them much if they have to move on to another job, as they are always getting experience and have not much at stake.

I should advise Mr. Ives to abstain from advertising his age and experience too much when he is applying for a post, unless he is certain that the advertisers want, and would appreciate, a man of sound and lengthy experience in engineering, and would be willing to pay a suitable salary to such an applicant. The old catchword "too old at forty" appears to be too much thought of by electrical employers, but if they would only think of recent conditions and the often blank ten years, since the war broke out, as regards business experience, put in by many young men who were with the forces, they would alter their ideas as to the most suitable age for the men they appoint to responsible posts. It is surprising, the number of men of 50, or even 60, who are nowadays more fit, mentally, morally, and physically, than the present type of young man of 30. I take the liberty of subscribing myself,

"Too Young at Forty."

July 14th, 1925.

An Illustrated Course of Lectures.

We wish, through the medium of your paper, to express our hearty thanks to Mr. A. M. Parkinson, B.Sc., A.M.I.E.E., for his very interesting series of lectures forming the "Summer Course," for which he used the kinematograph.

We are pleased to hear that it is to be used in future lectures, and wish Mr. Parkinson and the Battersea Polytechnic Institute every success in these.

Fulham, *July 15th*, 1925.

Definitive Units.

With regard to your editorial Note on "Definitive Units" in the June 5th issue of the ELECTRICAL REVIEW, I enclose a leaflet on "Octic" arithmetic.

Units based on the decimal system will always have limited usage. Until we change our base for calculating from ten to eight we will not have universal units. The persistence of the English money system is due to its binary divisions. Twelve as a base is just as objectionable as ten. The first contains the odd factor three, while the second contains the odd factor five.

However, I have no illusions regarding the probability of a change from ten to eight. Nothing less than a miracle, something wholly unexpected, will bring the change.

E. M. Tingley.

The Faraday Society.

The Electrodeposition of Zinc.

Now that the winning of zinc by electrolysis is in commercial operation and the method is likely to extend as time goes on, a study of the conditions under which good deposits can be obtained is of considerable interest and importance. A paper embodying a careful experimental research on zinc deposition from acid zinc sulphate solutions (which in practice have almost, if not entirely, replaced the chloride solution) was communicated to the Faraday Society on July 6th by Dr. A. L. MARSHALL, now in America. The work, which was carried out at University College, London, was primarily designed to obtain a closer insight into the effect of temperature on the characteristics of a zinc cathode and also to study the variation of current efficiency with temperature.

At first sight it would appear impossible to deposit zinc from an acid solution, seeing that zinc is far more electropositive than hydrogen and it would be expected to dissolve readily. It is only on account of the high discharge potential of hydrogen at a zinc electrode, its "over-voltage" to use the current term, that the latter is preferentially deposited at the cathode from a solution containing both zinc and hydrogen ions. If the zinc ion concentration is low, or the solution contains small amounts of other metal ions, the overvoltage may be so modified that hydrogen will be deposited more readily than zinc, and it therefore becomes important to study the potential effects at a single zinc electrode, using a standard hydrogen electrode for reference. Dr. Marshall has carried out a useful series of experiments on this point, evaluating the potential of the zinc electrode at various current densities, at different temperatures and with electrolytes of varying zinc content. In all cases the potential was found not to exceed a certain (negative) limiting value. An explanation based on chemical polarisation is put forward of the variations observed and also of the increase in efficiency of zinc deposition with rising temperature.

In the experiments to determine the effects of varying temperature, current density, and the concentrations of zinc and acid on the current efficiency of zinc deposition, Dr. Marshall employed an aluminium cathode placed between two peroxidised lead anodes. The composition of the electrolyte was kept approximately constant by adding pure zinc oxide from time to time. As was to be expected from the experiments with the single zinc electrode, there was invariably found an increase of efficiency with rising temperature, the increase being more marked with solutions of lower zinc content. Metals such as nickel, cobalt, and iron have been found to show this behaviour even more markedly than zinc. The effect of varying temperature and concentration of zinc and acid on the power consumption of the zinc cell was also investigated and again it was shown how the efficiency of deposition increased with rising temperature.

Finally, Dr. Marshall has studied the effects of metallic impurities on the electrolyte on the efficiency of zinc deposition. In the case of iron, small quantities had little effect on the efficiency, but larger quantities were very harmful, although nothing like so baleful as small quantities of antimony. Manganese, under certain conditions, when not so much was present as to be suspended in the solution in the form of oxide, actually retards the formation of hydrogen and so increases the efficiency of the zinc deposition.

Incidentally, a copper coulometer was developed in the course of the experiments, which may be of some general interest. It consisted of a circular platinum gauze cathode which was rotated at about 1,000 r.p.m. and a heavy sheet copper anode. The latter was ring-shaped from a sheet of copper 4 inches by 18 inches; with a current of 12 amp. the anodic current density was 0.03 amp./cm.^{2} The coulometer solution consisted of 125 gm. hydrated copper sulphate, 50 gm. concentrated sulphuric acid, and 50 c.c. alcohol in a litre of water.

Tests made on this coulometer using a standard Weston ammeter to measure the current gave the following results:—

Time.	Current.	Weight Copper (Found).	Weight Copper (Calculated).
10 mins.	15 amp.	2.965	2.964
,,	,,	2.964	,,
,,	12 amp.	2.369	2.371

The copper deposit was beautifully hard and coherent. The results show that this is a very convenient method for measuring even comparatively large currents.

Irish Free State Electricity Supply Bill.—In moving the second reading of the Electricity Supply (Special Powers) Bill in the Dail last week, Mr. McGilligan, Minister of Industry and Commerce, said that the whole principle of the Bill was to prevent new plant being installed, and to allow undertakings which had a surplus of plant to supply undertakings requiring additional energy, pending the materialisation of the Shannon scheme. The second reading of the Bill was passed and the next stage is fixed for November 3rd.

Business Notes.

Commercial and Industrial Developments, Business Changes, Trade Opportunities, New Publicity Literature, Liquidations and Failures.

Our Issue of August 7th.—Our Advertisement Department draws attention to the fact that, owing to the August Bank Holiday, new copy and alterations to existing advertisements for the issue of the ELECTRICAL REVIEW for August 7th must be received by Wednesday morning, July 29th, at the latest. All matter for our editorial pages will also require to be in our hands earlier than usual.

E.D.A. Activities.—Publication E.D.A. 566 which has recently been issued by the British Electrical Development Association illustrates and describes an ideal all-electric home. The booklet is written in a practical and interesting manner, while its pictures immediately create a most favourable impression of the cleanliness, convenience, and comfort of electrical service.

Electricity in Tin Mining.—In his speech at the recent annual meeting of the Sungei Besi Mines, Ltd., Mr. W. J. Payne said that larger dividends would have been paid had it not been for the necessity of reserving money to meet the cost of the new hydro-electric plant. A thorough investigation of the possibilities had been made, and a water licence had been secured from the Government of the Federated Malay States. It was hoped to make a commencement almost immediately, and there was no doubt that the scheme would result in lower production costs.

The Highland Show.—Electrical equipment for farm and dairy was prominent at the annual show of the Highland Society which was held in Glasgow last week. Among the exhibits were a windmill-generator for electric lighting and pumping shown by Messrs. McBain Bros., Ltd., of Tweedmouth; a 130-gallon cream separator with the driving motor incorporated in it, by Messrs. Watson, Laidlaw & Co., Ltd., Glasgow; crop-drying plant, shown and demonstrated by Messrs. Telford, Grier and Mackay; another wind-dynamo installation, for battery charging, made by Messrs. F. A. Wilkinson & Partners, Ltd., and shown by Mr. A. M. Russell, Edinburgh; and various apparatus exhibited by Messrs. McKenzie and Moncur, Ltd.

Employment during June.—The July *Ministry of Labour Gazette* shows that employment in the electrical engineering industry continued good during June. While the total proportion of unemployed for all branches of engineering was 11 per cent., in the electrical branch the figure was on 5.6 per cent. In the heavy engineering industries the proportion of unemployed was 12.3 per cent. Unemployment decreased in the electrical wiring and contracting industry, and in electrical cable, wire and lamp manufacturing, by 0.8 and 0.1 per cent., respectively.

Insuring against Bad Debts in Export Trade.—Mr. A. M. Samuel, M.P., the Parliamentary Secretary of the Department of Overseas Trade, has appointed a Committee, under the chairmanship of Colonel the Hon. Sidney Peel, to consider the question of insurance against bad debts in export trade. The Committee comprises representatives of the banks, accepting houses, insurance companies, Lloyd's, the Association of British Chambers of Commerce, and the Federation of British Industries, together with the Comptroller-General of the Department of Overseas Trade. Mr. F. H. Nixon, of the Export Credits Department, will act as Secretary.

Trade Announcements.—MESSRS. DORMOR & HINES, who have commenced business as wholesale electrical suppliers at 74, Old Christchurch Road, Bournemouth, wish to receive priced trade catalogues.

The notice in our issue of July 10th, p. 56, respecting a new "Exide" depôt at Glasgow was not quite correct in certain particulars. The purpose of the depôt is to give wireless and car-starter battery service and it will be under the control of Mr. A. T. Fraser, while Mr. Donald Sinclair will continue to act as the general representative for the whole of Scotland for all the CHLORIDE COMPANY'S manufactures.

The TWEEDALE MOTOR CO. LTD., Peebles, has opened an electrical and wireless department.

Catalogues and Lists.—MESSRS. DONOVAN & Co., 47, Cornwall Street, Birmingham.—An illustrated and priced folder dealing with the "Wandsworth" patent combination switch with automatic action.

MESSRS. SIEMENS BROS. & Co., LTD., Woolwich, S.E.18.—Catalogue 190, containing very full particulars of the company's ebonite manufactures with details of physical and electrical characteristics.

THE VACUUM OIL CO., LTD., Caxton House, Westminster, S.W.1.—A pamphlet dealing with steam cylinder and valve lubrication, specifying "Gargoyle" oils prepared for these purposes.

MR. J. R. MORRIS, Imperial House, 15-19, Kingsway, W.C.2.—Two illustrated pamphlets dealing with "Columbia" radio batteries.

SWITCHGEAR & COWANS, LTD., Old Trafford, Manchester.—Catalogue sections Nos. 4, 14-1, and 14-3, dealing respectively with spare parts for mining switchgear, "Andrews" reverse-power relays, and earth-leakage protection gear for systems with insulated neutral. Fully illustrated.

LAMLOK, LTD., 237, Acton Lane, Acton Green, Chiswick, W.4.—An illustrated pamphlet showing examples of the company's lamp-locking devices.

"MANDA" MOTORS, LTD., 53-54, Royal Mint Street, E.1.—A trade price list of "Manda" electric fans and small-power motors.

MESSRS. FERRANTI, LTD., Hollinwood, Lancashire.—A pamphlet illustrating a patent oil-filled cable box for transformers.

Bankruptcy Proceedings.—G. C. SPONG and J. H. TRUSSELL, trading as the C.C.S. TRADING CO., 30, Western Mail Chambers, Cardiff, electricians.—The public examination of these debtors was held on July 15th at the Law Courts, Cardiff. The debtor Spong stated that the concern was formed in January, 1923, and he acted as manager, his partner knowing most about the working of the business. The ranking liabilities were returned at £413, against assets of £25, leaving a deficiency of £388. The debtors attributed their failure to the loss of a contract. Debtor Trussell, in reply to questions, said that when they started trading he thought the business would keep them both, but the loss of the contract mentioned was disastrous. The examination was closed.

H. J. HEASMAN, Stamford Rivers, Ongar, Essex, company director.—The receiving order in this matter was made recently on a creditor's petition. The statement of affairs shows liabilities of £243 against assets of £1, leaving a deficiency of £242. Debtor attributes his failure to insufficient income. It appears that in August, 1914, he and his wife commenced business in partnership as general mechanical and electrical engineers, at Walthamstow, with £50 borrowed money, since repaid. On October 29th, 1919, the business was formed into a limited company with a capital of £5,000 in £1 shares, the debtor and his wife being allotted 2,200 shares, but he now holds only 10 shares. The following are creditors:—

	£		£
Greig, E. T. & M. R.	75	Income Tax Commissioners ...	20
Island Manufacturing Co., Ltd....	120	Shone, M. D.	25

F. J. NORTH, 13a, Midland Road Wellingborough, Northants, electrical engineer.—The public examination of this debtor was held recently at the County Hall, Northampton. The statement of affairs showed liabilities of £245, against assets of £28, leaving a deficiency of £217. Debtor attributed his failure to bad trade and lack of capital at the outset. The examination was adjourned.

V. G. BAINES, 2, West Street, Wellingborough, Northamptonshire, electrician and radio dealer.—The adjourned public examination of this debtor was held recently at the County Hall, Northampton. The statement of affairs showed liabilities of £185 against assets of £62, or a deficiency of £123. Debtor attributed his failure to lack of capital, working on credit, and competition. The examination was adjourned.

W. A. HUNTLEY, X-ray engineer, Farfield, Burnt Yates, near Harrogate, and 62, Albion Street, Leeds; late of Bradford.—The public examination of this debtor took place on July 17th, at the Harrogate Bankruptcy Court, when the statement of affairs showed gross liabilities of £1,233, of which £1,211 was expected to rank for dividend, and there were no assets. The examination was closed.

F. H. P. HOOLAHAN (Holloway Bros.), electrical engineer and instrument maker, 16, The Hale, Highams Park, and 209, Holloway Road, N.—Bankrupt discharged subject to consenting to judgment for 30s. being entered against him and payment of 30s. costs of judgment. (30s. paid to the Official Receiver in lieu of entering up judgment.)

W. K. M. WILSON, electrician and wireless apparatus dealer, 1, Mount Street, Heanor.—First meeting July 23rd, at the Official Receiver's offices, 4, Castle Place, Nottingham; public examination September 22nd, at the Court House, Derby.

H. FILDES, electrical engineer's superintendent, 108, Monton Road, Eccles.—First meeting July 22nd, at the Official Receiver's offices, Byrom Street Manchester. Public examination September 17th, at the Court House, Salford.

C. W. STOCKEN & C. FINK, Wyndham Radio Supplies, 74 and 80, Redcliff Street, Bristol.—Trustee, Mr. J. P. Emett, 18, Nicholas Street, Bristol, released June 18th.

G. W. TEMPEST (Northern Radio Co. & General Wireless Trading Co.) radio and telephone engineer, 40, Brazennose Street, and Arcade Chambers, Manchester, and Commercial Street, Leeds.—Receiving order made July 15th, on debtor's own petition.

A. O. JOYCE, electrician, 7, Park Parade, Leamington.—First meeting, July 28th at the Official Receiver's office, 9-11, High Street, Coventry. Public examination, August 19th, at the Shire Hall, Warwick.

J. S. YEOMANS, electrician, 11, Hill View Terrace, Chapel Allerton, Leeds.—First meeting, July 27th, at the Official Receiver's office, 24, Bond Street, Leeds. Public examination, August 5th, at the County Court House, Leeds.

R. A. BURNELL, electrical engineer, Harefield Park, Harefield, Uxbridge.—Receiving order made July 13th, on debtor's own petition.

J. S. TURNER (Stanley Motor Co.), electrical and motor engineer.—Trustee, Mr. E. D. Symond, Official Receiver, 11, Dale Street, Liverpool, released July 2nd.

P. L. SYMONS, electrician, 40, Victoria Road, Great Yarmouth.—Receiving order made July 9th on debtor's own petition. First meeting, July 27th, at the Official Receiver's office, 9, Queen Street Chambers, Norwich. Public examination July 28th, at the Town Hall, Great Yarmouth.

Company Liquidations.—DUBILIER CONDENSER CO.—Winding up voluntarily. Liquidator, Mr. F. W. Hollings, Ducon Works, Victoria Road North Acton, W. Meeting of creditors, July 27th, at Ducon Works. (This notice is purely formal for the purpose of complying with the provisions of the Companies Acts.)

ELBA, LTD., manufacturers of dry batteries, 1, Winchester Place, Acton.—The first meeting of the creditors of the above was held on July 17th, at the offices of the Official Receiver, Russell Square, W.C. Mr. Thomas Gourlay, the Official Receiver, occupied the chair, and reported that the statement of affairs had not yet been lodged. The company was formed on January 29th, 1924, for the purpose of taking over the business of manufacturing dry batteries for electrical purposes, and especially h.p. batteries for radio work. The issued capital was £1,353, of which only £103 was for cash, the balance being in respect of the vendor's shares. A debenture for £1,350 was issued, covering all the assets of the company. A receiver for the debenture-holder was appointed on April 28th last, but he had retired in favour of the Official Receiver, who at the moment was in possession of the assets and was realising them. The whole of the assets were subject to the debenture, and it did not appear that there would be anything for the unsecured creditors, whose claims were in the neighbourhood of £2,200. The assets were only estimated to realise £558. One of the directors stated that the position had been brought about by bad trade and keen competition particularly German competition, and the cancellation of important contracts. He added that when the debentures were issued for cash the assets had already been charged to the bank, and to others, for about £750. The money raised on the debentures was used to discharge those claims. A resolution was passed to the effect that no application should be made to the Court, and the Official Receiver therefore remains as the liquidator of the company.

M.E.L., LTD., 45-7, King's Road, Camden Town, N.W.—The first meetings of the creditors and shareholders of this company were held last week at Carey Street, W.C. The Official Receiver reported that the company was formed in July 1923, to carry on business as manufacturers of and dealers in electrical appliances and accessories. The issued capital was 5,650 ten per cent. cumulative preference shares subscribed for cash, and 2,400 ordinary shares issued as fully paid to the vendors of a business then acquired. The business carried on has been mainly that of manufacturers of and dealers in apparatus and accessories used in connection with radio-telephony; the company had also carried on a small trade in electric domestic appliances manufactured under the patents it had acquired. The failure was attributed to falling off of trade due primarily to the inability of the company to sell its goods profitably owing to foreign competition, and to the general fall in prices of apparatus used for radio-telephony which occurred during 1924. The accounts filed under the liquidation showed unsecured liabilities of £12,331, against assets valued at £2,575, consisting mainly of book debts. The liquidation was left in the hands of the Official Receiver.

LIVERPOOL ELECTRICAL ENGINEERING COMPANY (1923), LTD., 54, Oldhall Street, Liverpool.—A meeting of creditors was held recently at the offices of the Liquidator, Mr. C. Hodgson, accountant, Liverpool. A statement of affairs was submitted which disclosed liabilities of £4,222, of which £2,150 was due on debentures £775 was in respect of cash claims, and there were trade creditors for £1,297. The assets were estimated to realise £1,132, but from this had to be deducted £46 for preferential claims, leaving net assets of £1,086, or a deficiency of £3,136. It was reported that the company was incorporated on May 11th, 1923, to acquire the business previously carried on by Mr. John Clarke. The company took over the existing liabilities and allotted to the vendor or his nominees 1,996 fully paid £1 shares, and eight debentures of £100 each. The nominal capital of the company was £2,000. Subsequently the company purchased further plant and machinery for £525, that amount being advanced by Mr. J. Clarke. Further sums were also advanced to the company by Mr. Clarke, bringing the amount of his loan up to £1,350, for which a second charge was created in September, 1923. The trading of the company to March 31st, 1924, disclosed a loss of £2,297, which was attributed to the fact that the company was compelled to move into fresh premises, which caused it to dispose of certain plant and machinery and stock at a loss. Last September the company examined the position, and in view of the fact that the radio season was about to commence it was decided to continue trading, as there appeared to be some prospect of a profit being made. Those hopes were not fulfilled, and a further loss of £1,408 was sustained up to March last. A creditor for £300 then issued a writ, and the debenture holder appointed a receiver. It was stated that in addition to the amount of £2,150 in respect of which Mr. Clarke held debentures, he was also an unsecured creditor for £775, cash advanced. It was resolved to confirm the voluntary liquidation of the company, with Mr. Hodgson as liquidator.

ELECTROLITE, LTD., 138, Southbridge Road, Croydon.—The first meeting of the creditors of the above was held on July 15th. The Official Receiver said that a statement of the company's affairs had been lodged, showing unsecured debts of £2,166 and loans on debenture bonds of £10,372. The assets were estimated to realise £1,974, so that there was a deficiency, so far as the debenture holders were concerned, of £8,398. The liability to contributories was apparently £500. With regard to the debentures, there was one for £2,000, which appeared to be quite in order, but the Official Receiver said that there was a further debenture for £7,500 which might require consideration, although there did not seem to be anything very material in the point, as if the assets were correctly estimated, there would scarcely be sufficient to pay the debentures about which there seemed to be no question. A receiver and manager was in possession on behalf of the debenture holders. In the absence of a quorum the meeting was formally adjourned to enable the creditors to consider the question of appointing a liquidator.

FALLON CONDENSER MANUFACTURING CO., LTD.—A meeting of members is called for August 22nd, at 122-3, Moorgate Station Chambers, E.C., to hear an account of the winding up from the Liquidator, Mr. R. H. Dutchman.

P. S. WIRELESS MANUFACTURING CO., LTD.—Winding up voluntarily. Liquidator, Mr. E. Webb, 34, Grand Parade, Brighton. A meeting of creditors is called for July 27th at the liquidator's address.

Private Arrangements.—ASTRO ELECTRIC, LTD., 45, Carlton House, Lower Regent Street, S.W.1.—A meeting of the creditors of this company was held recently, when the Receiver, Mr. R. Rooke Jones, presented a statement of affairs which showed liabilities of £1,950, of which £653 was due to unsecured creditors; current expenses, &c., amounted to £46, salaries and commission totalled £169, and there were debentures and accrued interest amounting to £1,081. The assets were estimated to realise £1,504, leaving a deficiency of £446. The Receiver said he had endeavoured to dispose of the business, but so far without success. Since he had been carrying on the business the sales for April, May and June of this year had only amounted to £350, and if the business was continued it would not be in the interests either of the debenture holder or the creditors. He did not anticipate that any dividend would be paid to the creditors unless the business could be disposed of satisfactorily. The debenture holder was originally a director, but not at the time the debentures were taken up. The creditors resolved that the Receiver should approach four or five people in the electrical trade who might be interested in the purchase of the business and assets, and that a further meeting should be called as soon as *bonâ-fide* offers were forthcoming.

A. E. G. STONE, 61, Western Road, Hove, radio apparatus dealer and electrician.—A meeting of creditors was held on July 15th at the offices of Messrs. Bishop & Fenton-Jones, solicitors, Kingsland High Street, N.E. It was reported that the liabilities amounted to £2,813, of which £1,636 represented money advanced by the debtor's wife; there were trade creditors for £431, and there was a cash creditor for £683. There was also a claim for £209 in respect of advertising. The assets after deducting preferential creditors for £15 were estimated to realise £465. It was reported that the present position was due to very heavy bad debts and keen competition in the neighbourhood. The business was started by the debtor in September, 1921, with a capital of £75. For the year ended September, 1922, there was a loss of £15, while the debtor had drawn from the business only £27. From October, 1922, to March, 1924 there was a loss of £405 and the debtor drew £225. The creditors decided that the estate should be dealt with under a deed of assignment. The following are creditors:—

	£		£
Metropolitan - Vickers Electrical Co., Ltd.	35	Ullman (London), Ltd.	159
Bayleys, Ltd.	50	Pratt, Fred	33
		Mason & Co.	62

W. K. COXON, electrical and radio engineer, Nurshill, Lydney, Gloucestershire.—A circular has been issued to the creditors herein by Mr. C. Latham, stating that on June 19th a private conference of the larger creditors was held, at which a statement of affairs was submitted showing the assets to exceed the liabilities. The meeting was adjourned, and it was agreed that Mr. Latham, representing the largest creditor, whose account amounted to about half the total unsecured creditors' claims, should make an investigation and prepare another statement of affairs. At a further meeting on June 29th a statement of affairs was presented, and it was stated that negotiations were proceeding which, it was hoped, would result in the sale of the assets of the business for a sum more than sufficient to discharge the creditors' claims. On July 6th, at a further meeting, it was stated that negotiations were proceeding with a company for the sale of the plant, stock and machinery of Mr. Coxon for a sum of £1,000 in cash and the balance in shares in the company, leaving Mr. Coxon with the book debts. If this sale was effected there would be sufficient to discharge the liabilities of the trade creditors of the business in full. It was decided that, in view of the negotiations a deed of inspectorship to Mr. Latham should be

executed. The debtor has approved of this, and the creditors are asked to assent to the arrangement. An approximate statement of affairs shows ranking liabilities of £1,508, of which £1,082 is due to unsecured creditors and £426 to the bank. According to the books, the assets total £3,741, and at a forced realisation they are expected to produce £1,988, giving a surplus of assets over liabilities of £480. As a going concern the surplus is £2,233.

Dissolutions of Partnership.—MAGORIS, WIGHTMAN & Co., electrical engineers, Rusken Chambers Scale Lane, Hull.—Messrs. J. F. Magoris and O. N. Wightman have dissolved partnership. Mr. Magoris will attend to debts and continue the business.

HOWARD TERRY & Co., electrical engineers, Carlton House, High Street, Birmingham.—Messrs. F. H. Jeanes and M. Terry have dissolved partnership. Mr. Jeanes will attend to debts.

Deeds of Assignment.—R. H. W. GOUGH and H. SMITH (Electric & Radio Supply Co.), electrical engineers, 4, Waterloo Road, Epsom.—Particulars of claims by July 31st to Mr. W. A. J. Osborne, Trustee, Balfour House, Finsbury Pavement, E.C.

F. R. HICKSON, electrical engineer, 16, Dartmouth Park Hill, N.W.5.—Particulars of claims by July 31st to the Trustee, Mr. W. A. J. Osborne, Balfour House, Finsbury Pavement, E.C.

Foreign Capital in Bulgaria.—A recent inquiry into foreign capital invested in Bulgarian industry shows that approximately 2½ millions sterling has been put into 79 companies. Sugar, electricity works, tobacco, and mines are the principal industries with which foreign capital is connected. One-third of the total foreign capital invested comes from Belgium and another 45 per cent. is divided between France and Czecho-Slovakia. British capital invested in Bulgaria is insignificant.—*British Industries.*

Annual Holidays.—The offices of the City Electrical Co. will be closed from August 3rd to 10th.

The Prescot works of British Insulated & Helsby Cables, Ltd., will be closed from Saturday, August 1st, to Saturday, August 8th, inclusive.

The works of Messrs. Alfred Graham & Co. will be entirely closed from the evening of Friday, July 24th, until the morning of August 10th.

The works of the Record Electrical Co., Ltd., at Broadheath, Cheshire, will be closed from to-night, Friday, July 24th, until the morning of Tuesday, August 4th, for the annual holidays.

Book Notices.—"*Journal* of the Institution of Electrical Engineers," Vol. LXIII, July, 1925. No. 343. London: E. & F. N. Spon, Ltd. Price 10s. 6d.

The "Amplion Magazine," which is being produced by Messrs. Alfred Graham & Co., is of rather an unusual character. It is not strictly a "house" magazine, being directed to "all radio users," and although "Amplion" loud speakers receive special notice, it is not really advertisement. A number of interesting articles appear in the first issue, the writers including Capt. P. P. Eckersley, Mr. A. R. Burrows, and Mr. P. R. Coursey, B.Sc. The price is 1s.

"A Description of the Damages done by the Great Earthquake of September 1st, 1923, to the Electrical Installations in Japan"—prepared by the Japanese Electrotechnical Committee, Tokio, Japan.—The damages are treated generally in the order of the classified equipments. The considerations upon many of the peculiar effects are most interesting.

Technologic Papers of the U.S.A. Bureau of Standards, No. 284.—A study of the Seasonal Variation of Radio-frequency Phase Difference of Laminated Phenolic Insulating Materials (5 cents). Washington: Government Printing Office.

Callender's Band.—The Band of Callender's Cable and Construction Co., Ltd., whose performance at 2LO gave such pleasure to listeners on two occasions early in the year, again broadcast from the same station on Monday evening last.

Domestic Appliances in Ontario.—According to Mr. G. J. Mickler, head of the Merchandising Department of the Hydro-Electric Power Commission of Ontario, the percentage of fully electrically-equipped homes in Ontario is actually decreasing, probably because electricity is not being installed in all new houses, showing that the field for the sale of equipment is as big as ever. According to a table prepared by the department, reproduced in the *Electrical News*, only 13.8 per cent. of wired houses use electric cookers. The highest percentage (89.2) is reached by electric irons, while only 0.2 per cent. of the consumers have electric refrigerators. Other appliances which show a small percentage of users are water-heaters (4.8) and hot-plates (5.5). No appliance, with the exception of irons, as mentioned above, has a place in more than 44 per cent. of the consumers' homes.

English Plant at a Newfoundland Development.—A great deal of English machinery figures in an important hydro-electric development which is nearing completion in the Humber Valley, Newfoundland. The undertaking is being carried out by Sir W. G. Armstrong, Whitworth & Co., Ltd., in connection with a large pulp and paper mills. The British Thomson-Houston Co., Ltd., is supplying the main generating plant, consisting of seven 10,250-kVA, 6,600-V, 3-phase alternators, designed to run at 375 r.p.m. The power is to be stepped up to 66,000 V for transmission to the main sub-station of the mills, Canadian General Electric transformers being employed. The B.T.H. Co. has also supplied seven 2,600-h.p., 2,200-V synchronous grinder motors, and two similar machines have been provided by Messrs. Crompton & Co., Ltd. Messrs. Ferguson Pailin, Ltd., have supplied some of the switchgear, the main gear having been ordered from the B.T.-H. Co. A feature of the mills is the use of two 25,000-kW electric steam generators for heating the rolls of the newsprint machines. The output of the mills will be about 120,000 tons of newsprint per annum.

Indian Electrical Trade in April.—Our Indian correspondent says that the Indian trade figures for the month of April, 1925, show that the imports of electrical machinery into India during the month declined, and those of electrical instruments and apparatus considerably increased, as compared with the corresponding month of the previous year. Machinery imports amounted in value to Rs. 14½ lacs as against Rs. 19½ lacs, while instruments and apparatus increased from 15 lacs to 23¾ lacs. The decline in the case of machinery has been mainly under the head "Meters," from 5 lacs to 2½ lacs, and "Miscellaneous," from 7 lacs to 3¾ lacs; control and switchgear showed an increase from 4 lacs to 5 lacs. The United Kingdom's share decreased from 17½ lacs to 13 lacs, but as imports from the United States have declined considerably, the percentage share of the United Kingdom shows a little improvement. Imports from Germany increased from Rs. 19,000 to Rs. 52,000, and those from Sweden from Rs. 3,000 to Rs. 16,000. Under "Electrical instruments and apparatus," the general increase of about 8 lacs has been mainly under the heads "Electric wires and cables," from 3 lacs to 8 lacs, and "Electric lamps" which increased from 1 lac to 2½ lacs. The United Kingdom considerably improved its position, the value of its imports rising from 9 lacs to 17½ lacs, the proportion being increased from 65 to 85 per cent. Germany and the United States both showed decreased trade.

New French Companies.—Among the new hydro-electric concerns lately formed in France are the Société des Forces Motrices de la Haute Creuse, with a capital of 3½ million francs, to acquire and work the Croix Blanche and Confolent stations at Moutier-Rozelle, in the Department of Creuze; and the Société des Forces Motrices de la Glane formed at Tulle with a capital of 5 million fr.

A new company has lately been formed in Paris (22 Rue Julie), with a capital of 100,000 fr. and the title La Société des Etablissements Kenotron to manufacture radio apparatus.

La Société de Distribution Rurale d'Energie Electrique is the name of a new company which has lately been formed at Ruffec, in the Department of Charente, with a capital of 1,200,000 fr.

Consumer-Ownership in Canada.—According to the *Financial Times*, the Shawinigan Water and Power Company has just completed a customer-ownership campaign, which has brought in 3,300 shareholders, making the total 7,700 shareholders, or an addition to the stockholders' list of 75 per cent. The total number of shares sold was approximately 12,000, representing a value of $1,600,000. A novel feature in connection with this campaign was that the company placed at the disposal of its customers common stock at $132 per share, instead of preferred stock, as is the practice in customer-ownership campaigns. The net yield on the investment at this price is 5.3 per cent. The terms were cash or deferred payments, and the average subscription was about 3⅔ shares. This company was the first utility company in Canada to offer stock to its customers, and is the pioneer in the customer-ownership field.

Local Exhibition.—TAMWORTH.—On p. 124 we give some particulars of the undertaking of the Pooley Hall Colliery Co., Ltd., which supplies electricity in Tamworth, Staffs. Mention is made of an exhibition which was recently held there and a view of the display is reproduced. The following companies were among the exhibitors:—The Credenda Conduits Co., Ltd. (cooking equipment and domestic appliances); the British Thomson-Houston Co., Ltd. ("Mazda" lamps and lighting fittings for home shop, and factory, "Tungar" rectifiers, fractional h.p. motors, and domestic apparatus); the General Electric Co., Ltd. ("Osram" lamps and lighting fittings, including the "Wembley" street-lighting lantern and colour-sprayed lamps, and electrical appliances for the home); the Western Electric Co., Ltd. (the "A.S." washing machine and an ironing machine, which were demonstrated, and various domestic apparatus); Metro-Vick Supplies, Ltd. (lighting fittings, fires, radio apparatus, &c.); the Siemens & English Electric Lamp Co., Ltd. (domestic appliances, the "Stannos" wiring system, and lighting fittings); the Tamworth Electrical Contracting Co. (various apparatus made by the leading electrical concerns); Hoover, Ltd. (vacuum cleaners); the Coventry Wireless Supplies, Ltd. (radio apparatus made by the principal British firms); and the Singer Sewing Machine Co., Ltd. (electrically-driven and lighted sewing machines).

Greek Power Contract.—Sealed tenders for the carrying out of power extension works in Athens, the Piræus, and the suburbs have just been opened by the Government, and have aroused great interest here. One was sent in by an Anglo-Greek group, consisting of the Power & Traction Finance Co., of London, allied with the principal Greek banks, headed by the National Bank, and with a guarantee for its proposals of £2,000,000 from the British Treasury, under the Trade Facilities Act. The only other competitor is the existing Greek Electrical Co.—*Reuter* (Athens).

The Rutenberg Concession.—The Bagdad correspondent of the *Financial Times* states that Baron Edmond de Rothschild has subscribed £100,000 to the Rutenberg electric power undertaking in Palestine, and that Mr. F. Worburg has promised to finance the scheme up to $500,000. The cost of the first stage of the scheme, which was the subject of a concession granted in 1921, was estimated at £750,000.

The Mulungushi Power Plant.—In the course of his speech at the recent annual meeting of the Bechuanaland Exploration Co., Ltd., the chairman (Mr. Edmund Davis) mentioned that the Mulungushi hydro-electric plant had been opened by the Prince of Wales. This plant has been erected by the Rhodesia Broken Hill Development Co. to provide power for its mine plant 39 miles away. The output capacity of the plant is 2,500 h.p. initially, but the site is capable of development up to 20,000 h.p. An artificial lake about 15 miles long and nearly four miles wide in places has been created for impounding the water against times of minimum flow.

A Canadian Telephone Contract.—The Manitoba Government Telephone Commission has recently awarded a contract for the installation of an automatic telephone exchange in the St. James's District of Winnipeg, to Messrs. Siemens Bros. (Canada), Ltd., a subsidiary company of Messrs. Siemens Bros. & Co., Ltd., of Woolwich. This firm installed the St. John's Exchange in Winnipeg in 1923. A considerable order for automatic dials and telephone instruments has been awarded to the same firm.—*Electrical News.*

Competition for Czecho-Slovakian Order. — The Witkowitz Iron Works Co. has placed the contract for a large steam turbine for its new electric power station with the Erster Brunner Maschinenfabrik of Brunn. Several English firms are reported to have competed for the order.

New Italian Companies.—A new company has lately been formed in Turin with a capital of 500,000 lire and the title La Società Fabbrica Accumulatori Elettrica.

The Società Collocamento e Lavorazione Telefoni Automatici "Scelta" has been formed in Milan, with a capital of 300,000 lire.

Among the new hydro-electric undertakings recently organised in Italy are the Società Idro-Elettrica di San Filippo, at Contigliana, capital 500,000 lire; the Società Idro-Elettrica dell' Isario, Rome, capital 100,000 lire; the Società Forze Idrauliche del Ceno, Barma, capital 90,000 lire; and the Società Forza Elettrichi Val Degagna, Milan, capital 200,000 lire.

A number of new concerns have lately been formed in connection with the radio industry in Italy.

Czecho-Slovakian Radio Exhibition.—Arrangements are in hand for the holding of a radio exhibition in Reichenberg from August 15th to 21st next.

Standardisation in Industry.—In the course of an address delivered at Leeds last week, Col. V. Willey, president of the Federation of British Industries, said that the growing adverse trade balance meant a decreasing amount available for foreign investment and as the latter always re-acted on exports, it was obvious that unemployment must increase. He said that industry in its present precarious state was not satisfied that the Government appreciated its critical condition. We as the premier manufacturing country were feeling most acutely the world trade shrinkage. Later, Col. Willey said (according to *The Times* report) that wastage in industry could be eliminated in an enormous number of ways. He would merely instance the possibilities of saving by standardisation. The present vast multiplicity of sizes, qualities, and specifications involved in their turn an immense cost in merchant stocks, in small unit transportation, and neglect of mass production possibilities. That was a tremendous field for possible economy. Let them imagine the saving in standardisation in hotel and institutional china, in plumbing supplies, paints and varnishes, in bolts and nuts, in bottles, wire fencing, timber. The idea that odd sizes gave the manufacturer competitive advantage was a fallacy. The only case where unlimited divergence seemed justified was in padlock keys. The Government could here well give a lead in standardising equipment for all Government Departments; but a determination of specification must be subsequent to the determination of standards in quality and dimension. By a Government lead in the simplification of business practices enormous saving to the taxpayer could be effected.

Swiss Firm to Finance an Austrian Company.—According to *Commerce Reports* the Salzburg Electric Company is constructing a 60,000-V transmission line in the Salzburg province. The company will be financed for this purpose by the Swiss firm, Aluminium A.G., of Neuhausen. The loan will not be made directly to the company but through the provincial Government. It is assumed that the Aluminium Company will supply the materials.

The Telephone Industry.—At a meeting of the Committee on Industry and Trade held last week at the Board of Trade, evidence was given on behalf of the Telephone Development Association by Mr. H. E. Powell-Jones, the secretary of the Association. After stating that the telephone manufacturing industry employed some 100,000 people, exclusive of 50,000 employed by the Post Office on telephone business, the witness pointed out that all the manufacturers could do was to create a demand and that they could not ensure that this demand was promptly satisfied. The principal cause, Mr. Powell-Jones stated, lay in the policy of annual revision of estimates, which made it difficult for the Post Office to lay down a programme in advance. The Association urged a policy whereby the probable requirements for a period of years should be ordered in advance. This policy would enable manufacturers to formulate a works programme and would result in employment being continuous instead of spasmodic. This should result in lower prices and more even quality, in addition to better deliveries. Further, it would assist manufacturers to tender more satisfactorily for contracts from abroad.

Golf Tournament.—A number of the principal members of the staff of the Automatic Telephone Manufacturing Co., Ltd., recently participated in a golf tournament. Messrs. H. W. Brooke and H. Adams reached the final, and the match was played off on the Bowring Park Municipal Golf Course, Liverpool, on July 10th. Mr. Adams received five strokes but was defeated after a very level game.

Swedish Wiring Practice.—An article on this subject recently appeared in *Commerce Reports*. It is stated that Swedish wiring practice conforms closely to the German methods. In the better-class buildings Bergmann or other forms of tubing are used; in many other buildings wiring on porcelain cleats is adopted. When lead-covered cables are used they are required to be armoured. Rotary and push-button switches are generally employed, although tumbler switches are used to some extent. The fuses are mainly of the Edison screw plug or the German "Diazed" types; cartridge-type, open-link and thumb-grip fuses are not employed. Edison screw sockets are general, the bayonet type being almost unknown.

For Sale.—Manchester Corporation Electricity Department invites offers for surplus electrical instruments, &c., including ammeters, voltmeters, relays, &c. Hastings Corporation Electricity and Public Lighting Committee has for disposal surplus generating plant consisting of steam turbines, alternators, boilers, cooling towers, &c. (See our advertisement pages to-day.)

Strike at Lochaber. — Work upon the Lochaber hydro-electric scheme was held up last week by a strike of carpenters and joiners, about 1,000 in all. The dispute originated with the dismissal by the contractors, Messrs. Balfour, Beatty and Co., of a joiners' shop steward. The strike lasted a day and the men decided to return to work pending negotiations.

German Activity in Italy.—In a review of a report upon the situation in Italy during the past year, the *Board of Trade Journal* says that Italian factory production itself is developing year by year and is becoming a formidable competitor with the goods of other countries. For the business available to foreigners Germany is a severe competitor. A feature of the year has been an intensive canvassing campaign on the part of German representatives on an even larger scale than before. These representatives speak Italian and know the country intimately, carry price lists in Italian, and are able to show complete collections of samples from which all traces of their origin have been removed. Prices are now quoted in lire. It is thought that no other country could contemplate competition with these representatives on anything like the same scale and it is doubtful whether the market would furnish sufficient orders to pay any other country to follow in the German's footsteps; yet it is a fact that they are reaping the fruits of their initiative.

Spanish Hydro-Electric Development.—The Seville Electric Co., of Seville, which controls the hydro-electric facilities throughout South-west Andalusia, has announced that it intends to issue a 6 per cent. loan to the amount of 10,000,000 pesetas for the carrying out of a large programme of hydro-electric extension involving the purchase of foreign equipment.

British Trade-mark Applications.—The following are among the recent applications for British trade marks. Objections against any of the proposed marks may be entered within one month from July 15th :—

Eos. No. 456,449. Class 4. Electric and galvanic carbons.—The firm trading as C. Conradty, 9, Spittlertorgraben, Nuremburg, Germany. (British representative: S. Sokal, 1, Great James Street, Bedford Row, W.C.1.)

Pixie Grippa. No. 459,076. All goods in class 8.—Perophone, Ltd., 76-78, City Road, E.C.1.

Eddystone (lettering and design). No. 456,158. Class 8. Instruments and apparatus, and parts thereof, for use in radio-telephony and telegraphy, but not including electric batteries and cells, nor goods of a like nature.—Janet, Rainsford & Laughton, Ltd., Alexandra Works, Kent Street, Birmingham.

Design only. No. 458,840. All goods in class 8.—Chinn's Patents, Ltd., 33, Brazennose Street, Manchester.

Icall. No. 448,364. Class 11. Electrolysis outfits, electric massage vibrators, air douches, radiant heat lamps, &c.—I. Calvete, Ltd., 11, Little St. Andrew Street, W.C.2.

Lumina. No. 459,539. Class 13. Sparking plugs for internal-combustion engines.—A. E. Macdonald, 5, St. John's Road, Golder's Green, N.W.4.

Memite. No. 459,287. Class 50. Electrical insulating materials.—The Midland Electrical Manufacturing Co., Ltd., Barford Street, Birmingham.

Amplifying Equipment at St. Peter's.—MESSRS. ALFRED GRAHAM & CO., LTD., have received a letter from Signor Federico Mannucci, the chief engineer of the Vatican, congratulating them upon the success of the amplifying equipment installed by them for the recent imposing ceremonies in St. Peter's Cathedral, Rome. It is stated in the letter that the apparatus enabled a huge assembly of 30,000 persons to hear every word of the ceremonies.

Proposed Municipal Showrooms.—The Loughborough Town Council proposes to open a showroom in connection with the Electricity Department, and shop premises are being inspected for the purpose.

Czecho-Slovakian Radio Regulations.—The importation of radio apparatus into Czecho-Slovakia is subject to a licence granted by the Ministry of Commerce, jointly with the Posts and Telegraphs Department. To obtain a licence manufacturers or their agents are required to submit drawings or a sample of the apparatus which it is desired to import. The use of reaction is prohibited by the Government.

Lead.—Messrs. James Forster & Co. report under date July 18th:—"Considering that demand from consumers this week was quiet and a general strike is threatened, the market shows a remarkably firm front. All lead arriving is quickly absorbed, and it is estimated in some quarters that there is an average consumption of lead in this country of 21,000 tons a month, an increase of from 3,000 to 4,000 tons a month over last year. In Germany, also, there has been a large increase, the average monthly imports this year of 14,000 tons being over 100 per cent. higher than during the same period of last year. This would mean a total increase in the United Kingdom and Germany of about 120,000 tons a year, apart from any increase in the United States, where consumption is running at a high level. If this rate is maintained, we can see nothing for it but still higher prices for lead, for, although production is increasing, it is not doing so to nearly the same extent. The Board of Trade returns show as follows:—May: Imports, 23,962 tons; exports, 3,678 tons; leaving 20,284 tons. June: Imports, 19,400 tons; exports, 2,278 tons; leaving 17,122 tons."

Social Event.—The staff and employés of Messrs. Macdonald, Syer & Co., Ltd., held their annual outing on July 11th. The *venue* was Southend and lunch was taken at the Palace Hotel, Mr. C. Stanley Syer presiding.

Chinese Notes.—The Yung Ming Electric Lamp Factory has recently commenced operations in Shanghai. The company has installed German machinery; its lamps bear the trade mark "Klasun."

The Mukden authorities are considering the installation of a long-distance telephone service between Tientsin and Shanghai. The line will be erected in four sections, *viz.*, Tientsin-Tsinan, Tsinan-Hsuchow, Hsuchow-Pukow, and Nanking-Shanghai. A cable will be laid in the Yangtze River to connect Pukow and Nanking. The total length of the line will be over 2,900 li (970 miles), and its cost is estimated at between 1½ and 2 million dollars.

The Yalukiang Electrical & Water Supply Co., a Sino-Japanese concern, is being organised with a capital of 6,000,000 yen to supply electricity and water in Antung.

An electric lighting company commenced operations at Yutse (Shansi) in May with a capital of $30,000.

The Shihkiachwang Telephone Service Co. has been registered in the Chihli province with a capital of $50,000. Another company to provide telephone service at Tsanghsien, in the same province, is being organised.

Proposed Large Canadian Aluminium Plant.—The *Electrical News* (Toronto) reports that the approval of the Provincial Government of Quebec has been given to the development of 600,000 h.p. near the Saguenay River. The power will be employed in a large aluminium producing plant which is to be erected by a group controlled by Mr. J. B. Duke, the American magnate, and Mr. E. H. Davies, who controls one of the largest aluminium companies in the world. The expenditure involved is estimated at between 75 and 90 million dollars.

Lighting and Power Notes.

Ashton-under-Lyne.—NEW CHARGES.—The Electricity Committee has recommended that the rateable value system of charging for domestic supplies be adopted, based on an annual fixed charge of 15 per cent. of the net rateable value of the house plus ½d. per kWh for all purposes; also that the scale of charges for three-phase energy to large consumers be varied by increasing the basic price of coal from 10s. per ton to 12s. delivered at the generating station, the increases over 12s. to be 0.02d. per kWh for each 1s., and proportionately for fractions of 1s.

Barnes.—BULK SUPPLIES.—The Urban District Council has now received quotations from neighbouring authorities for a bulk supply of electricity and is comparing them with the cost of extending the Barnes works.

Bedford.—EXTENSION OF OFFICES.—The Electricity Committee recommends the provision of new office accommodation by remodelling and extending the existing offices at a cost of £2,750.

APPLICATION FOR LOAN.—The Town Council has applied for a loan of £30,000 for electricity purposes.

Belgian Congo.—NEW SUPPLY COMPANY.—Under an agreement between the Société Union Minière and the Société Electricité et Traction, of Brussels, a new company is being formed with a capital of 75 million francs and the title La Société Générale des Forces Hydro-Electrique du Katanga to establish a plant to utilise the water power of the Lufia Falls in the Belgian Congo, for the supply of electricity to the mines of the Union Minière. Under the terms of the agreement the last-named concern will have the right to purchase the electrical undertaking at the end of 30 years on the basis of the profits during the preceding seven years.

Birmingham.—ALL-ELECTRIC HOUSES.—Two experimental houses now being erected at Bournville are to be equipped throughout for both heating and lighting by electricity. Only one fire grate is being put into each house, and it is estimated that this will make a saving of £20 on the equipment expenses.

Bradford.—MAINS EXTENSIONS.—The Electricity Committee has sanctioned an expenditure of £20,000 on mains extensions.

LOAN SANCTIONED.—The Committee has obtained sanction to borrow £1,724 in connection with the provision of an e.h.p feeder from the Valley Road works to Bolton Road sub-station

SUPPLY TO SHIPLEY.—The Committee has come to terms with the Yorkshire Electric Power Co. with respect to a bulk supply of electricity to the Shipley U.D.C.

NEW PLANT.—The new 20,000-kW turbo-generator is expected to be ready for work in two months' time.

Brecon.—OBJECTION TO ELECTRICITY ORDER.—The Brecon Gas Co. has lodged an objection to the Council's application for a Special Order for the supply of electricity.

Carlisle.—MAINS EXTENSIONS.—The Unemployment Grants Committee has agreed to the scheme of the Electricity Committee for laying electricity mains in various streets at a cost of £7,957.

LOAN SANCTIONED.—The Electricity Committee has received sanction to borrow £5,000 for electricity purposes.

Chard.—PROPOSED CONFERENCE.—The Town Council has received a communication from the Axminster Rural District Council to the effect that the promoters of the Axminster electricity scheme would be pleased to confer with the Chard Town Council to see whether any agreement could be arrived at for removing the objections to the scheme.

Chester.—OVERHEAD TO OUTLYING DISTRICTS.—Overhead transmission lines are being erected to form a belt at a distance of about four miles from the city of Chester. In this way an area of about 70 square miles will be supplied with energy.

Northern Ireland.—COLERAINE.—The Rural District Council is considering an application from the Coleraine Urban Council to obtain powers for the supply of electricity in the rural district.

Colwall.—ELECTRICITY SUPPLY.—The Hereford Corporation has assented to the Malvern Council's seeking powers to afford a supply of electricity to Colwall. The Malvern Council undertakes that the charges shall not exceed 20 per cent. of the rates in force at Malvern.

Continental.—SPAIN.—The Riegos Fuerza del Ebro (a Pearson enterprise) is considering a gigantic development of its plant. If this project is carried out the company will be able to provide all the electric power necessary for Catalonia, but the work would entail enormous expenditure and a long time would elapse before its completion.

According to an industrial map of the province lately issued by the Barcelona Chamber of Industry, water power to the extent of 326,175 h.p. is now being utilised in Catalonia. The major portion—268,813 h.p.—is used for hydro-electric purposes.

FRANCE.—The Société Biterroise de Force et de Lumière has lately completed the erection of a 30,000-V transmission line between Plaissan and Beziers. The company has also entered into an agreement with the Société Pyrenéenne d'Energie Electrique for the establishment of a second transmission line between the power station at Luzieres of the Société des Forces Motrices de l'Agout and Beziers.

East Morton.—ELECTRICITY SUPPLY.—An offer by the Bingley Council to supply electricity to East Morton at the price charged in Bingley, plus 7½ per cent., was accepted, and support will be given to Bingley's application for an order to supply electricity in the district.

Edinburgh.—PROPOSED EXTENSIONS.—Important proposals for the extension of the Portobello electricity station are being considered by the Corporation Electricity Committee. The estimated cost is £400,000. It is recommended that the work of the building extensions should be proceeded with at once, a decision to be reached later regarding the extent of the generating plant which would be required.

LIGHTING OF HOUSING AREAS.—The Corporation Lighting Sub-Committee recommend that provision be made in the estimates for additional lighting in housing areas and for increasing the wattage of electric lamps where this is unsatisfactory. The cost of the proposed extension is £2,067.

East Ham.—Cable Extensions.—The Electricity Committee has prepared a scheme for cable extensions at a cost of £4,751; it has also obtained sanction to borrow £1,199 for the extension of distributor mains.

Faversham.—Correction.—The new plant at the electricity works includes two Vickers-Petters heavy oil engines of 320 b.h.p. each, and not two Browett-Lindley engines, as stated in our issue of July 17th.

Great Yarmouth.—Year's Working.—The results of the year's working (1924-5) of the electricity undertaking (engineer: Mr. P. G. Campling) show an income of £48,953, as compared with £51,598 for the preceding year. The working expenses were £28,179, against £33,308, leaving a gross profit of £20,774 (£18,289). After deducting the capital charges, &c., a net surplus of £2,136 is shown, against £2,123 for 1923-4. During the 15 months ended March 31st, 1925, the sales amounted to 3,563,532 kWh.

Gloucestershire. — Opposition to Applications. — The County Council has decided to oppose the Gloucester application for extended powers for the supply of electricity, also the Cheltenham application and those of the Avon Valley Company and the West Gloucestershire Power Company.

Hamilton. — Acquisition of Undertaking. — The Town Council has adopted a recommendation by the Electric Lighting Committee to acquire the electric light undertaking from Messrs. Edmundsons from January 1st next. The committee is to meet the general manager to complete the negotiations.

Hathern.—Bulk Supply.—The village is to receive a supply of electricity from the Loughborough electricity works. It is proposed to erect overhead cables (2,800 yards) at an approximate cost of £1 3s. 3d. per yard in the main streets and 19s. 5½d. per yard in the side streets.

Ilkeston.—Supply Powers.—The Corporation has now received powers to supply electricity to various places in the district.

India.—Calcutta.—The new power house of the Calcutta Electric Supply Corporation, which is in course of construction, will be started with two 6,000-kW turbo-generators and three 50,000-lb. boilers. Ultimately it will be possible to increase the capacity of the generating station to 100,000 kW. It is understood that the station will be ready for running in September, 1926.

Japan.—Reserve Plant.—It is reported from Tokio that a law has been enacted requiring all hydro-electric power stations in Japan to be provided with a reserve steam plant capable of producing 10 per cent. of the normal output.

Keighley.—Distribution Conference.—A conference of local authorities is being called by the Town Council to discuss questions affecting the distribution of electricity in the north-western portion of the West Riding of Yorkshire.

Liverpool.—Street Lighting.—More than seven miles of thoroughfares in Liverpool have been converted from gas to electric lighting during the past twelve months and the Electric Power and Lighting Committee is carrying out a scheme to illuminate every city street with electricity.

Northampton.—Hospital Installation.—The Northamptonshire County Council has decided to install electric light and power at the Barry Wood Mental Hospital at a cost of £4,750.

Penang.—Year's Working.—We have received a report on the working for the year ended December, 1924, of the Electricity Supply Department (engineer and manager, Mr. W. J. Williams). The income was £91,555 and the working expenses amounted to £63,461, leaving a gross profit of £28,094. After deducting capital charges, &c., the net surplus amounts to £6,462. The capital expenditure during the year amounted to £118,905, making a total of £467,496.

Preston, Blackburn, and Blackpool.—Applications Recommended.—The Electricity Advisory Board for Mid-Lancashire has decided to recommend to the Commissioners that applications by the Preston, Blackburn, and Blackpool Corporations for permission to develop their electricity undertakings be granted.

Portsmouth.—Year's Working.—The statement of accounts of the electricity undertaking for the year ended March 31st last shows a total income for the year of £151,572, against £130,054 in the preceding year. The working expenses are recorded as £99,224, against £79,705, leaving a gross profit of £52,347 (£50,348). Deduction of the capital charges &c., leaves a net surplus of £14,574, compared with £17,904 for the year 1923-4. The capital expenditure for the year was £111,086, including £68,762 spent on mains, making a total of £748,087. The total kWh sold during the period amounted to 10,262,205, while the maximum demand was 7,000 kW. The bulk sales totalled 458,088 kWh.

Extension of Generating Station.—The Electricity Committee has received consent to extend the generating station.

Loan Sanctioned.—The Town Council has received sanction to a loan of £14,900 in connection with the scheme for supplying electricity to Hayling Island.

Application for Loan.—Application is to be immediately made for sanction to borrow £35,000 for mains to be laid in the areas first to be supplied under the Special Order for extensions which has been granted.

Price Reductions.—Reductions in the charges for electricity have been made or recommended in the following districts:—

Ayrshire.—Private lighting: First 1,000 kWh per quarter to 6d. per kWh; beyond this figure 5½d. per kWh; 4½d. per kWh, with a minimum guarantee of 20,000 kWh per annum. Power (l.p.): First 5,000 kWh per annum, 2½d., the next 5,000 kWh, 2d., 1½d. for a further 5,000 kWh, 1½d. for the next 5,000 kWh, and 1d. for all beyond. Maximum demand: £6 per kW plus 0.5d. per kWh up to 150 kW, £5 10s. plus 0.5d. up to 200 kW £5 plus 0.5d. up to 250 kW, £5 plus 0.4d. up to 300 kW, and above this £5 plus 0.3d. Domestic heating: To 1½d. per kWh.

Weybridge.—10d. per kWh for the first 100 kWh per quarter and 9d. per kWh beyond.

Swansea.—Lighting: Flat rate from 6d. to 5½d. per unit; maximum demand system: The war increase reduced from 40 to 20 per cent. Power: The war increase reduced from 25 to 12½ per cent. Heating and cooking: Winter quarters from 2d. per kWh to 1½d. per kWh. Meter rent: By 50 per cent.

Bedford.—Cooker hire charges: From 10s. per quarter to 7s. 6d. in respect of large cookers, and from 8s. 6d. to 6s. 6d. in respect of smaller cookers.

Harrogate.—Lighting: By 1d. per kWh. Heating: By ½d. per kWh. Power: To 4d. for the first 116 kWh per h.p. per quarter.

Exeter.—Lighting: To 5½d. per kWh. Heating: To 2d. per kWh. Power: To 1½d. per kWh.

Barnes.—Rateable value system: To one penny per kWh throughout the year, meter rents to be reduced by 1s.

Grays.—Lighting: For first 1,000 kWh per quarter 7d., next 1,500 6d., beyond 5d.; prepayment meters, 8d. Power and heating: For first 500 kWh 3d., next 3,500 2½d., beyond 2d. Outside shop lighting, 5¼d. Cooking: If cooker is purchased, 1½d.; cooker hired, through separate quarterly meter, 1½d.; cooker hired, through separate prepayment meter, 2d., with a rebate of 1d. in each 1s. collected; cooker purchased, through separate prepayment meter, 2d., with a rebate of 2d. in each 1s. collected.

Fleetwood.—Reduction of over 10 per cent. on previous charges. Lighting: First 200 kWh per quarter, 6½d. per kWh; 201 to 400, 6d.; 401 to 600, 5½d.; 601 to 1,000, 5d.; 1,001 to 1,500, 4½d.; over 1,500, 4d.; prepayment meters, 8½d. per kWh and 2d. in 1s. discount. Power: Up to 2,000 kWh per quarter, first 500 kWh at 2½d., remainder 1½d.; over 2,000 and up to 5,000, a flat rate of 1½d.; over 5,000 a sliding scale from 1½d. to 1d. at 30,000, subject to coal clause for consumption of over 5,000 kWh per quarter. Heating and cooking purposes: A flat rate of 1½d. Discount to Railway Company to be increased from 5 per cent. to 7½ per cent.

Rawtenstall.—Application for Loan.—The Town Council is to apply for sanction to borrow £32,000 for the purchase of a 6,000-kilowatt turbo-alternator and the necessary equipment for extensions to the Corporation electricity works at Hareholme.

Ryde.—New Charges.—The Ministry of Transport has made an order authorising the Isle of Wight Electric Light and Power Co. to make the following charges for electricity as from July 1st:—Winter quarters: For any amount up to 15 kWh, 12s. 6d., and beyond, 10d. per kWh. Summer quarters: Any amount up to 10 kWh, 8s. 4d.; and 10d. per kWh beyond.

Saltburn-on-Sea.—Non-Purchase Decision.—The Urban Council has affirmed its previous decision not to purchase the electricity undertaking supplying the town.

Sheffield.—Year's Working.—The statement of accounts for the year ended March 31st, 1925, for the electricity supply undertaking (engineer, Mr. S. E. Fedden), shows a working expenditure of £368,994, against £297,729 for the previous year. The income amounted to £813,024, compared with £808,946, resulting in a gross profit of £444,030 (£511,217). After deducting the capital charges, &c., the net surplus stands at £147,510, against £201,411 for 1923-4. The capital expenditure for the year amounted to £149,406, making a total of £4,015,892; £131,792 was expended on sub-station buildings and mains. The average price per kWh during the year was 1.186d. The kWh sold increased by 2,568,316, or 1.7 per cent. The maximum demand for the year was 229,032 kW.

South Devon.—Supply Inquiry.—The Electricity Commissioners have appointed Col. Ekin, of the Ministry of Transport, to conduct an inquiry regarding proposals to supply electricity over a wide rural area in South Devon. This area extends from Prawle Point to Teignmouth on one side and Moretonhampstead on the other. The Teignmouth Electric Lighting Company has asked for powers respecting part of this area, including Kingsteighton, Bishopsteighton, Bovey Tracey, Teigngrace, Trusham, and Heathfield.

Southend.—NEW PLANT INQUIRY.—Col. T. C. Ekin, M.Inst.C.E., representing the Electricity Commissioners, opened an inquiry at the Clarence Hall, Southend, on July 14th, into the application of the Town Council to borrow over £75,000 for new plant and the conversion of the system of distribution. The principal witnesses were Mr. W. H. Patchell and Mr. R. Birkett, the borough electrical engineer. The latter gentleman spent some 6½ hours in the witness-box, and was mercilessly cross-examined for some time, says the *Southend Times*, on matters contained in the report of the late Mr. C. H. Wordingham. The figure referred to includes £40,000 in respect of new plant; £7,100 and £2,980 in respect of expenditure in excess of grants on previous sanction; and £25,000 for the purpose of laying a.c. mains, &c.

Southwick.—ELECTRICITY SUPPLY.—Considerable progress has been made with the laying of feeders to supply this area from the Brighton electricity undertaking, and it is hoped that the supply will be available in time for the next lighting season.

Special Orders.—The Electricity Commissioners have submitted to the Minister of Transport for confirmation, Special Orders made by them for the supply of electricity in the following districts:—The County Palatine of Lancaster, by the Urban District Council of Ashton-in-Makerfield; the rural district of Whitchurch in the county of Southampton, by the Whitchurch and District Gas Company, Ltd.; also a Special Order made by them authorising the London Electric Supply Corporation, Ltd., to supply the Southern Railway Co. with electricity to be used for purposes incidental to the working or lighting of certain railways.

Application is being made by the Darlington Corporation to supply electricity in the rural districts of Darlington and Croft.

The Urban Council of Dartford has decided to apply for a Special Order to supply electricity to the parish of Stone.

Stockton.—MAINS EXTENSIONS.—The Electricity Committee has agreed in principle to the laying of a new h.p. main from the works to the Dinham Road area, and the erection of an outdoor sub-station, at an estimated cost of £5,500. The electrical engineer is to report further on the matter later.

Strood (Kent).—ELECTRICITY IN BULK.—The Rural Council has decided not to accede to an application by the County of London Electric Supply Co., for an order to supply electricity in bulk by mains to be laid between Barking and Rochester.

Swansea.—MAINS EXTENSIONS.—The Electricity Committee has decided to lay electricity mains in various roads at a cost of £33,000, and to borrow £50,000 for prospective extensions to mains and house services.

Torquay.—APPLICATION FOR ORDER.—Subject to the disposal of an application by a private company for an Order to supply energy in an adjoining area, the Torquay Corporation proposes to apply for an Order for powers to supply outside its area, which would then enable negotiations to proceed with Edmundsons' Electricity Corporation, Ltd., for a supply in bulk to other districts. It is suggested that such a supply could be given to Dartmouth.

OVERHEAD LINES.—The Electricity Committee has obtained the consent of the Ministry of Transport to the erection of overhead lines to supply electricity at Kingskerswell.

Truro.—ELECTRICITY SUPPLY.—The Truro Corporation has accepted the offer of Messrs. Edmundsons' Electricity Corporation, Ltd., to supply electricity to the city, subject to provisions that the maximum price charged shall not exceed 10d. per unit for lighting and 5d. per unit for power, and that the company shall undertake to adopt as soon as possible the proposed Government standard periodicity.

Warwick.—NEW CABLE FEEDER.—The Leicestershire and Warwickshire Electric Power Co. is to lay a cable from the power station at Warwick to Coventry.

Watford.—PLANT EXTENSIONS.—The Electricity Committee has decided to ask for permission to install a 5,000-kW turbo-alternator and a 30,000-lb. water-tube boiler at the electricity works.

West Thurrock.—PUBLIC LIGHTING.—The Parish Council has accepted the offer of the County of London Electricity Supply Co. for public lighting at £3 7s. 6d. per 100-watt lamp. The total cost of lighting will be £351 18s. 6d., against £414 5s. 9d., the estimated cost of gas lighting.

Woking.—EXTENSION TO POWER STATION.—The Woking Electric Supply Co. are to enlarge their power station at the junction of Board School Road and North Road.

Wrexham.—OBJECTION TO BULK SUPPLY SCHEME.—The Wrexham Rural District Council has decided to make a formal objection to the application of the Wrexham Corporation for powers to distribute electrical energy within parts of the rural district.

Worcester.—APPLICATION FOR LOAN.—The City Council has applied to the Electricity Commissioners for a loan of £33,300 to carry out the first instalment of a scheme under the Electricity Extension Order.

Tramway and Railway Notes.

Argentina.—BUENOS AIRES.—Plans are under consideration for an underground electric railway in Buenos Aires to connect the Retiro railway station in the North with several important suburbs in the southern part of the city.

Bradford.—NEW TRAM TRACK.—The City Council has decided to re-lay the tramway track from the junction at Eccleshill to Five Lane Ends after considering the installation of a railless car system.

Continental.—AUSTRIA.—Austria will, within the next three years, electrify an additional 300 kilometres of its railways, and will purchase upward of 70 electric locomotives. A total of $18,000,000, part of the remaining proceeds of the International Loan for Austria, recently released for this purpose by the League of Nations finance committee, will be used to finance this electrification.—*Commerce Reports.*

ITALY.—Work has lately been completed on the electrification of the railway between Genoa and Sestri Levante.

A new electric railway has lately been completed and opened for traffic between Eribano and Agordo a distance of about 17¾ miles.

FRANCE.—The Midi Railway has prepared plans for a projected electric railway to the summit of the Pic du Midi de Bigorre, which has an altitude of 9,435 ft.

Work has been practically completed on the electrification of the Midi railway between Montrejean and Luchon, a distance of 22½ miles

SWITZERLAND.—Such good progress is being made with the electrification of the Olten-Berne section of the Swiss Federal railways that it is expected the work will be completed a month or two before the date specified in 1923, *i.e.*, by the end of 1925. This will enable work on the electrification of the Pratteln-Brigue line to be started somewhat earlier than was anticipated.

Dudley.—TRAMWAY ABANDONMENT.—The Ministry of Transport has sanctioned the abandonment of the tramway track from Dudley to Kingswood.

Java.—ELECTRIFIED STATE RAILWAYS.—The first electrified section of the Java State railway has recently been completed and opened for traffic. It is about 10 miles in length and runs from Batavia to Tandjong Priok. The power is transmitted at 7,000 volts from a hydro-electric station about 60 miles away, the current being converted to 1,650 V, d.c., at two sub-stations in Batavia.

Middlesbrough.—YEAR'S WORKING.—A progress table for the tramway and 'bus undertakings shows for the former a gross income for the year 1924-5 of £67,343, against £64,547 for the previous year. The working costs amounted to £48,493, against £45,245, leaving a gross profit of £18,850 (£19,302). The reduction of capital charges, &c., leaves a deficit of £4,316 against £3,848 for 1923-4. The car mileage for the year was 718,854, compared with 667,976 for the preceding year. There was a deficit of £3,414 on the 'bus services.

Penang.—YEAR'S WORKING.—The accounts for the year ended December 31st last of the Tramway Department (engineer and manager, Mr. W. J. Williams) record a total expenditure of £22,971 and an income of £27,923, leaving a gross profit of £4,952. The net result after deducting capital charges, &c., was £470 profit. The capital expenditure during the year was £4,579. The accounts for the 'buses and railless cars are both included in the above.

Southport.—YEAR'S WORKING.—We have received a copy of the annual report for the year ended March 31st last, on the working of the Tramway Department (general manager, Mr. T. J. Kendrew). The revenue is shown as £76,627, against £70,841 for the preceding year. The working costs amounted to £52,365, against £48,703, leaving a gross profit of £24,261 (£22,137). After deducting capital charges, &c., a net surplus of £4,401 is shown. The car miles run during the year reached a record figure of 1,015,969, an increase of 873,110.

Sunderland.—TRAMWAY REPLACED BY 'BUSES.—The Sunderland District Tramways Company has withdrawn the last of its tramway services and the track is being pulled up. The company has substituted motor-'buses for tramways, and has 58 'buses operating on eight separate routes in the Houghton-le-Spring-Durham-Sunderland area.

Swansea.—TRACK IMPROVEMENTS.—The Corporation has agreed to advance £25 000 to the Swansea Tramway Co. for doubling and improving the tramway track.

Walsall.—YEAR'S WORKING.—The accounts for the tramway way undertaking (engineer and general manager, Mr. C. Burgess) for the year ended March 31st, 1925, show a total income of £78,690 as compared with £76,315 for the previous year. The total working expenses were £55,285 against £57,378, leaving a gross surplus of £23,404 (£18,937). The capital charges for the year amounted to £13,109, which, after adding income from other sources, leaves a net profit of £10,877, as compared with £5,242 for 1923-24. The car miles run during the year increased from 901,580 to 933,143, and the number of passengers carried was 11,373,512, compared with 10,744,392 for the preceding year.

Telegraph and Telephone Notes.

Belgium.—ANGLO-GERMAN TELEGRAPHIC COMMUNICATION.—A meeting attended by three Ministers and officials connected with the Belgian Telegraph Administration was held on July 18th at Brussels for examining anew the installation of a cable from La Panne, on the Belgian coast, to Herbesthal, on the Belgo-German frontier. This cable is intended to assure direct telegraph communication between England and Germany, which is best served by way of Belgium. The present Belgian installations are unable to cope with the traffic, a large part of which is transmitted *via* Holland. The projected cable is estimated to cost one hundred million francs [about £950,000 at present rates]. It was suggested that the best solution would be for the work to be done by Germany under the head of reparations.—*The Times.*

India.—TELEPHONE TRAIN CONTROL.—The installation of telephone train control by the B.B. & C.I. Railway Co. has removed much of the cause of delays in running time which were so frequently experienced before its adoption, and again further relief was afforded when a system of track-circuiting was introduced extending over the section between Colaba and Bandra stations. These improvements have had the effect of enhancing the operating efficiency of the service in that 40 per cent. increase in the number of train movements per diem has been made possible.

Italy.—AUTOMATIC TELEPHONY.—An automatic telephone exchange on the Western Electric Co.'s system has recently been completed in Naples.

Mexico.—AUTOMATIC TELEPHONY.—According to *Commerce Reports* the Mexican Telephone & Telegraph Co., which was established 37 years ago and now has 32,000 miles of line in 10 Mexican States, has been granted a concession by the Congress of the State of Tamaulipas to install an automatic telephone system in Tampico. Several small lines in the State of Tamaulipas will be taken over, consolidated, and ultimately connected with existing lines. Work must be begun within eight months of the approval of the plans, and the company is obligated to have its lines into Matamoros within four years.

Postmaster-General's Statement. — In the House of Commons on July 20th the Postmaster-General (Sir W. Mitchell-Thomson) reviewed the working of the postal, telegraph, and telephone services during the past year. He said that the position with regard to telegraphs continued to be unsatisfactory; the service had incurred a deficit of £1,330,000. This was attributed to the competition of the telephone service. The latter service continued to make steady progress. In spite of the reductions in the fees, there had been a surplus of £865,000; it was expected that the further reductions which had been made would reduce the current year's surplus to £500,000. The Postmaster-General refrained from going into great detail regarding the telephones as he proposed shortly to introduce a Bill to make provision for capital expenditure upon the telephone service over a series of years. He made special mention of the increasing use of automatic telephony and to telephone communication with the Continent.

Referring to broadcasting, he said that the arrangements for the appointment of a Committee to study the whole matter were well in hand.

Dealing with Imperial radio communication, Sir W. Mitchell-Thomson said that the stations for communication with Canada and South Africa were due to be completed in October, and the sending and receiving stations for India and Australia were to be ready within nine months. It had been provisionally agreed that the Marconi Co. should be licensed to serve the following European countries, in addition to countries outside Europe:—Austria, Bulgaria, Denmark, Finland, France, Greece, Portugal, Russia, Spain, Sweden, Switzerland, Turkey, and Jugo-Slavia.

Radio at Sea.—SHIP-SHORE SERVICE BANNED.—The G.P.O. has declined permission to the Cunard Co. to install a wireless telephone station at Liverpool as a medium of communication with its liners at sea. The White Star Line experimented twelve months ago with a wireless telephone service by which it hoped to establish regular connection between its ships at sea and Cherbough, but it was found that, principally owing to interference from other wireless services, the scheme was not a success. It is understood that a representative of the Marconi Company will visit Liverpool shortly to discuss details of new experiments.

Shetland Islands.—TELEPHONE SERVICE.—Telephone development has reached even the distant Shetlands. This month sees Lerwick equipped with a new telephone exchange with a manual switchboard, and a continuous service instead of just a daytime one as hitherto.

The Telephone Service.—RE-NAMING EXCHANGES.—By the time the next issue of the London telephone directory is in the hands of subscribers, there will be three further changes in exchange names, yet another step towards the introduction of automatic telephones: East Ham will be re-named Grangewood, Woodford will become Buckhurst, and Kingsbury will change to Colindale. Single digit telephone numbers will disappear, and big business houses will have four digit numbers instead of the familiar No. 1. The practice of calling for certain commercial exchanges by name only will cease and "Lloyd's" and "Baltic" will henceforth be known by numbers.

Radio Notes.

The B.B. Co..—PROGRAMME PLANS.—Lord Gainford, chairman of the B.B.C., at the second general meeting of the company, claimed that there is still great evasion in spite of 1,371,581 licences having been issued up to June, an increase of 567,000 during the year. "Not only is our present income not large enough," he said, "but even if and when the number of licensed listeners increases to 2,000,000 the income derived will not secure the standard of service which we desire to attain." Out of £666,000 received for licences during 2¼ years to March 31st, 1925, £612,000 has been spent in programmes, leaving a surplus of £54,000. It is essential to provide more alternative programmes than are at present possible to the great majority of listeners, and proposed improvements involve an expenditure of approximately £100,000. An income of £500,000 is expected from licenses next year, which will be spent on programmes. Lord Gainford emphasised that 85.37 per cent. of expenditure has thus been incurred on programmes, only 6.38 per cent. on administration (head office administrative salaries and wages, general expenses, directors' remuneration, &c.), and the balance of 8.25 per cent. on depreciation.

France.—RADIO LEAGUE.—An organisation open to all persons interested in radio communication in France has been formed at a meeting in Paris. This "National Federation of Wireless Clubs" represents the great majority of the 600,000 radio amateurs in France, and will deal with all questions of interest to listeners. M. Foveau de Courmelles was elected president, and vice-presidents were chosen for each district of France. Technical and juridical advisers were also appointed. —*Reuter* (Paris).

Germany.—SHORT-WAVES.—It is reported that the German Postal Ministry has decided to permit amateur broadcasting on short wave-lengths.

New Zealand.—NEW STATIONS.—The Christchurch correspondent of the *Daily Mail* reports that the Government and a new broadcasting company have agreed to the erection of modern 500-watt broadcasting stations at Auckland, Wellington, Christchurch, and Dunedin.

Rumania.—RADIO LAW.—The Department of Overseas Trade has sent us a translation of the "Law for the installation and use of Radioelectric Posts and Stations" in Rumania which has been received from the commercial secretary at Bucharest. The regulations were published on July 8th and they provide, *inter alia*, that the right of exploitation of broadcasting in Rumania belongs to the State, and may be carried out either through the General Post Office or through a limited company which will have the sole right of broadcasting. The State will contribute to the company 60 per cent. of the capital and will have the majority of votes at the general meeting and on the Council of Administration in proportion to its shareholding; private persons may participate to the extent of 40 per cent. The company will have the right to impose an annual tax for the use of receiving apparatus, fixed by agreement with the Ministries of Finance and Communications and with the approval of the Council of Ministers. Of this tax the General Post Office will take at least 30 per cent., of which it will give 10 per cent. to the town hall in the place where the apparatus is installed. The Ministries of Education, Worship and Arts, and of Communications will each have a delegate on the Board of Administration and 50 per cent. of the net profits accruing to the State from the company shall form a fund to be used specially for purposes of propaganda and national culture by wireless telephony. The broadcasting company can make agreements with enterprises in the country or abroad for the supply and erection of transmitting and receiving apparatus in models approved by the General Post Office. The General Post Office will register and control all apparatus in order to make sure that no system is used which might disturb other posts. All apparatus imported from abroad and that made in Rumania must, before being sold, bear the seal of control of the General Post Office. For certifying the apparatus the Post Office will charge a tax.

Transatlantic Broadcasting.—EXCHANGE OF PROGRAMMES.—In connection with the development of international broadcasting, the British Broadcasting Co. has sent a message to America through Mr. David Sarnoff, vice-president and general manager of the Radio Corporation, stating that, further to explore the possibility of an international exchange of programmes, the British organisation plans to establish a central station for receiving the world's most powerful broadcasting stations, and it hopes during the next winter season to be able to re-transmit to its 10,000,000 listeners Transatlantic programmes. The complete technical arrangements made on both sides of the Atlantic encouraged the B.B.C. definitely to allocate part of its programme time as an "American Programme Period, and it understands that similar arrangements will be made in the States. The scheme concerns other European countries besides England, and the *Evening News* explains that Continental programmes will be picked up by a new receiving station which is being built just outside London and thence conveyed by land line to Daventry, whence they will be re-radiated.

Telephotography in America.

Developments in the Transmission of Pictures over Telephone Lines.

THE broad principles of the electrical transmission of drawings, figures, photographs, &c., from one point to another have been known for years, but the systems heretofore devised have been insufficiently developed to meet the requirements of modern commercial service. Prominent amongst the newer developments which have facilitated picture transmission are the photoelectric cell, thermionic amplifier, electrical filters, and the use of carrier currents, the method described below having been designed for practical use over long distances on the Bell telephone network in the U.S.A.

Fig. 1.—Indian Lake, Adirondachs ; 220-mile Circuit.

The successful development that has taken place during recent months may be gauged from the accompanying illustrations, all of which have been reproduced from untouched prints made from the untouched negatives taken from the receiving apparatus in March and April, 1925. Each picture was transmitted in 7½ minutes, those shown in figs. 1 and 2 having been sent from Washington to New York City over a 220-mile telephone circuit, while those shown in figs. 3, 5 and 6 from New York to Chicago, or *vice versa*, over a circuit 931 miles long.

The negative picture to be transmitted is prepared in the form of a transparent positive celluloid film which is bent into the shape of a cylinder ; the latter is mounted on a carriage that is made to move along its axis at the same time that the film cylinder is rotated, and a spot of light thrown upon the film by an optical system is thus caused to traverse the entire film area in a long spiral. The light passing into the interior of the cylinder varies in intensity with the transmission (or tone) of the picture, and is transformed into a variable electric current by means of a photoelectric cell upon which it impinges. The vacuum cell has an alkali metal cathode (such as potassium), and its response to variations of illumination is practically instantaneous, the photoelectric current being directly proportional to the intensity of the light spot. Assuming the photoelectric current (which is d.c. of varying intensity) to be adequate and the transmission line to be suitable for carrying d.c., the photoelectric cell current may be imagined to traverse a communication line, at the far end of which is a "light valve" for reproducing the transmitted picture. This valve consists of a narrow ribbon-like conductor lying in a magnetic field in such a position as to entirely cover a small aperture; by passing the incoming current through the ribbon, the latter is deflected by the interaction of the current and the magnetic field, and so exposes the aperture beneath. Light passing through the aperture is thus varied in intensity, and if it is allowed to fall upon an unexposed photographic film (bent into cylindrical form and rotating in exact synchronism with the film at the sending end), the film will be exposed by amounts varying in proportion to the lights and shades of the original picture.

Fig. 3.—Interior View, Library ; 931-mile Circuit.

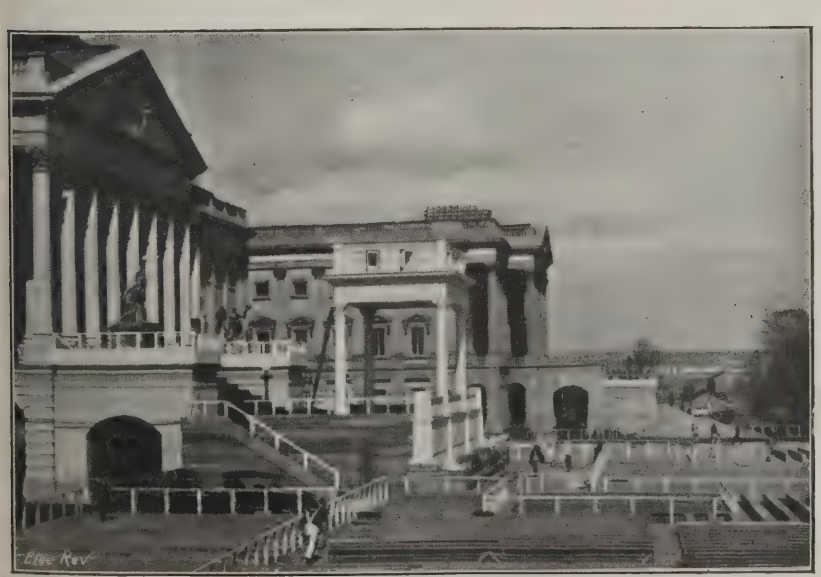

Fig. 2.—Capitol Buildings, Washington ; 220-mile Circuit.

Of the existing electrical means of communication, the wire telephone circuit has proved to be the most suitable for adaptation to the system postulated. Commercial long-distance telephone lines are, however, not ordinarily suitable for transmitting weak direct or low-frequency currents, and accordingly the photoelectric cell current is amplified by thermionic valves and then impressed upon a modulator jointly with a carrier current whose frequency is about 1,300 cycles per second. What the telephone line transmits, then, is the carrier wave modulated by the photoelectric wave so that the currents are similar in

frequency range and amplitude to the currents corresponding to ordinary speech. When the modulated carrier current traverses the ribbon of the light valve at the receiving end, the aperture is opened and closed with each pulse of alternating current; the envelope of the pulses follows the light and shade of the picture, but

controlled by electrically-operated tuning forks. Impulses controlled by the fork at the sending end are transmitted to the receiving station over the same circuit, the picture on a 1,300-cycle carrier and the synchronising pulses on a 400-cycle carrier, the two carrier frequencies being obtained from two thermionic

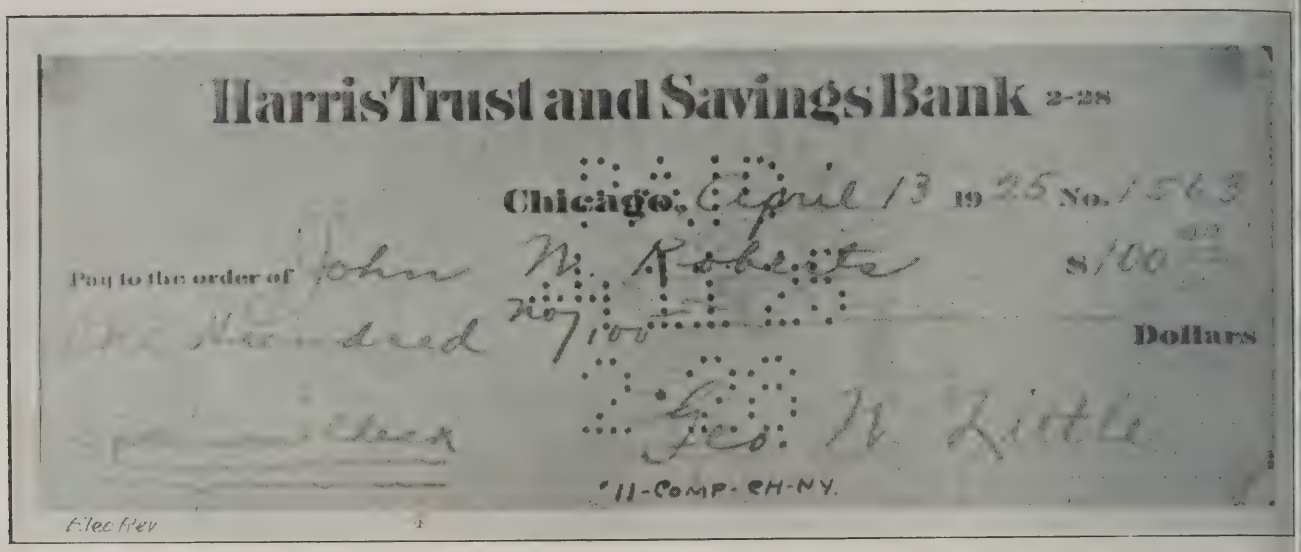

Fig. 4.—Specimen Cheque Telephotograph.

the actual course of the illumination with time shows a fine structure, of the periodicity of the carrier as indicated by the enlarged section of a picture (fig. 8), the black lines being traces of the image of the light valve aperture. Superposed on the larger variations of width, which are proportional to the light and shade of

valve oscillators, and the two currents are kept separate by electrical filters at the sending and receiving ends of the line. Space considerations do not permit reference to the interesting electrical circuits of the amplifier-modulator and filter systems; the functions of starting the two ends simultaneously and the transmission of

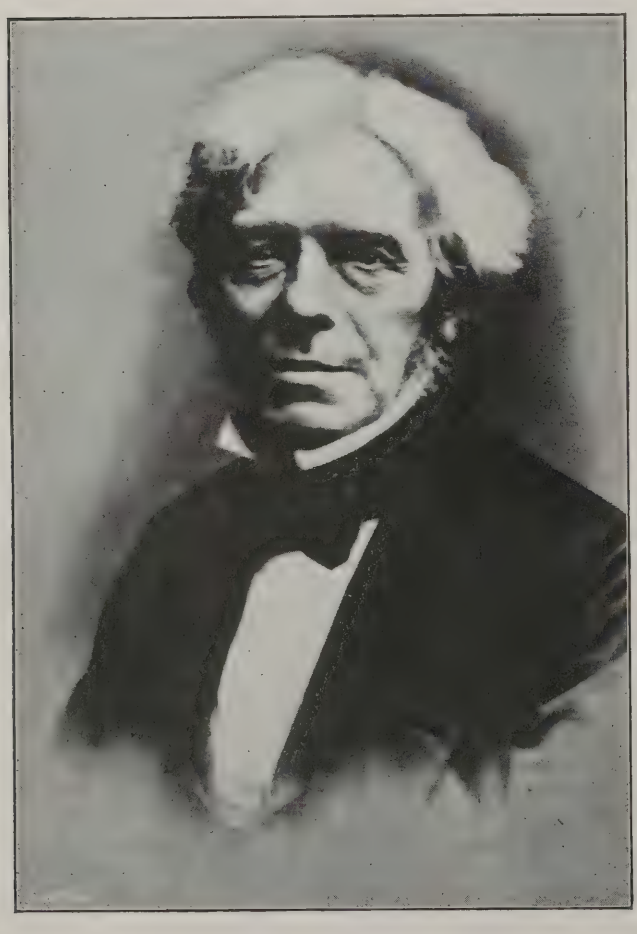

Fig. 5.—Michael Faraday; 931-mile Circuit.

Fig. 6.—X-ray Picture; 931-mile Circuit.

the picture, small steps may be noted (particularly where the line width varies rapidly), which are caused by the carrier pulses.

To secure accurate reproduction, the rotation of the transmitting and receiving cylinders is maintained at the same uniform rate with the aid of phonic wheels

signals are performed by the interruption of the picture current working through detectors and relays, while testing circuits are provided for adjusting the various elements without utilising the actual transmission line. No important changes in the transmission characteristics of the telephone line are called for; with regard to the

frequency range of the a.c. transmitted and also the permissible line attenuation, picture transmission is less exacting than speech, but variations in the transmission loss of the line, or noise appearing even for a brief instant, will be recorded as blemishes on the finished picture, while a high degree of balance between the lines and their balancing networks at repeater points is necessary. Picture transmission by radio is less stable and not so free from interference.

There are two methods of reception: (*a*) When an image of the light valve aperture is formed on the photographic surface, the picture is made up of lines of constant density and varying width. A merit of this type of picture (when received in the negative form) is that if the structure is of suitable size (from 60 to 65 lines to the inch) it may be printed directly on zinc for making a typographic printing plate, thus saving copying time, but a disadvantage is that such a picture does not readily lend itself to retouching or to change of size in reproduction. (*b*) If, however, the light from the light valve is allowed to fall on the film in a diffused manner through an aperture of fixed length so that lines of constant width (exactly juxtaposed), but of varying density, are produced, prints made from film negatives received in this way (if the structure is chosen fine enough, *i.e.*, 100 lines to the inch, or more) may be reproduced by the ordinary half-tone cross-line screen. Electrically-transmitted pictures are, in general, suitable for all purposes for which direct photographic prints are used, being faithful copies of the originals.

Fig. 7.—Specimen Finger Print.

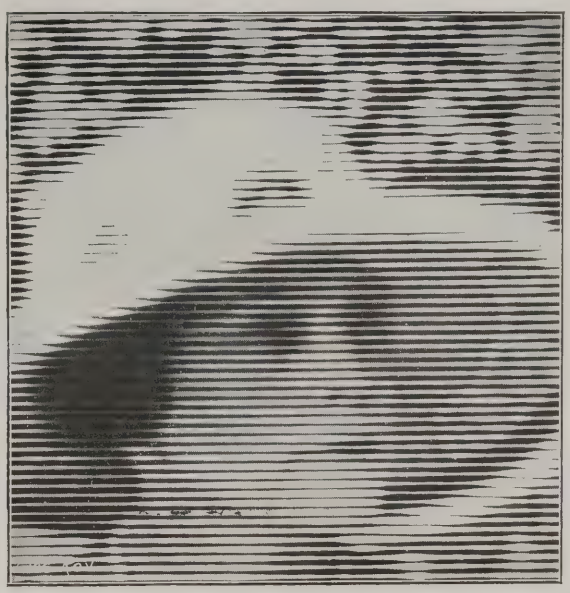

Fig. 8.—Portion of Variable-line Picture, Enlarged.

In conclusion, we have to express our indebtedness to Mr. F. Gill (International Western Electric Co.) for furnishing the pictures reproduced herewith, the accompanying details of the system employed having been abstracted from the *Bell System Technical Journal*.

A Record of Half-a-Century.

Messrs. Johnson & Phillips's Charlton Works.

To have remained on the same site, constantly growing in importance and magnitude, for half a century is a record which may be paralleled in mechanical engineering, but is probably unique in the electrical field. Messrs. Johnson & Phillips started the manufacture of cables and accessories in 1875, in the primitive workshop illustrated in fig. 1, which is still standing in the midst of the buildings which now occupy over 15 acres and employ approximately 2,500 workpeople. In those days Charlton was a village, and the electrical industry consisted wholly of telegraph engineering; commencing in that line, the firm contrived its own machinery not only for making submarine cables but also for laying them, and has continued the business with such success

Fig. 1.—Original J. & P. Workshop.

Fig. 2.—Main Cable Shop; 20,000 sq. yd. Area and 1,000 ft. Long.

that it claims to have equipped the majority of the world's cable steamers with paying-out, picking-up, and cable-handling machinery.

The introduction of electric lighting opened a new field for the company's activities. At that period electrical engineers hesitated at nothing; if they wanted

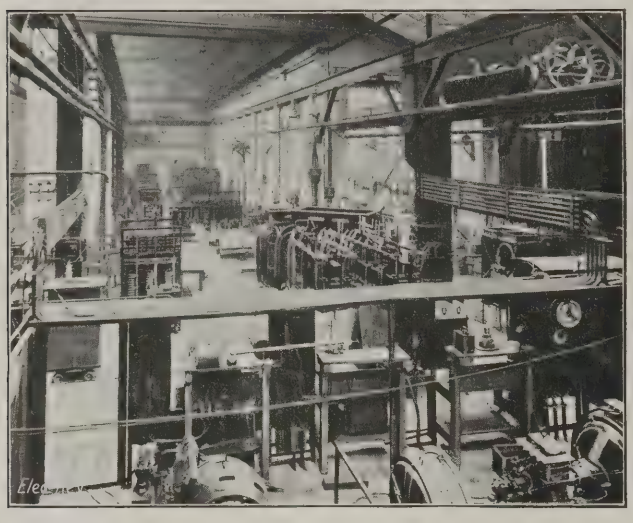

Fig. 3.—Transformer Shop Bay.

some piece of apparatus they made it, and thus a dynamo factory sprang up at Charlton—of which for a time the late Dr. Gisbert Kapp, who exercised so great an influence on dynamo design, was the director—and large numbers of machines were manufactured during the 'eighties and 'nineties. Arc lamps were also produced, the Brockie-Pell lamp which at one time was so widely known and highly esteemed being first manufactured by the company, which maintained its position in the front rank of arc lamp makers until the metal-filament lamp came into general use. The "Metroflam" magazine flame-arc lamp, designed by the late Mr. James Brockie, was one of its products. Rubber-insulated cables, of course, for lighting and power, were manufactured at the Charlton works, and from these it was a natural step to the production of lead-covered, paper-insulated cables for feeders and distributors. Such cables, for ever-increasing power and pressure, to-day form a most important part of the company's output, the cable shops, of which one is illustrated in fig. 2, occupying a large proportion of the floor space of the factory. Here, again, as in the case of submarine cables, Messrs. Johnson & Phillips designed their own machinery, and have supplied similar plant to almost

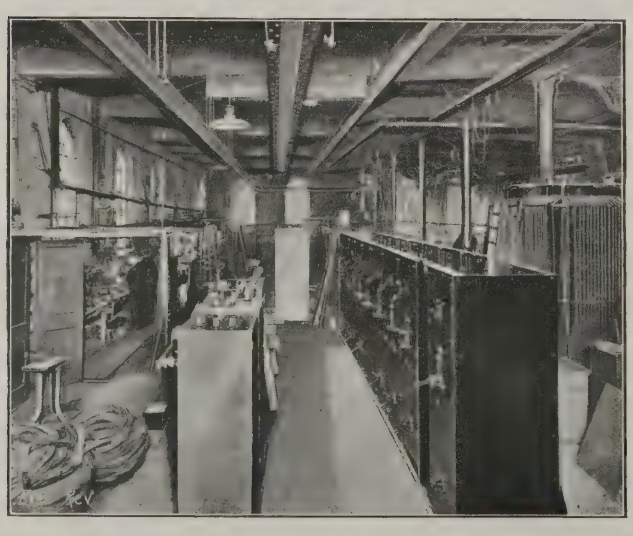

Fig. 4.—A Section of One Switchgear Shop.

every manufacturing country in the world. They make paper-insulated cables for pressures up to 33,000 volts, as well as the junction boxes, &c., for use with them; they also make cables insulated with vulcanised bitumen for mining work, claiming for their "Elastumen" type that it is free from the decentralising trouble, and like most other cable makers, they have their own "J. & P." twin metal-sheathed surface wiring system, for which all the virtues are claimed, as well as their cab-tire-sheathed wires and cables. Electric light flexibles and trunk telephone cables are likewise included in the company's operations.

Fig. 5.—A 33,000-V Line; Edinburgh Corporation.

Generators are not now built at Charlton; the company has devoted its attention rather to the transmission end of the electrical circuit, and this involves the addition of the manufacture of transformers and switch-

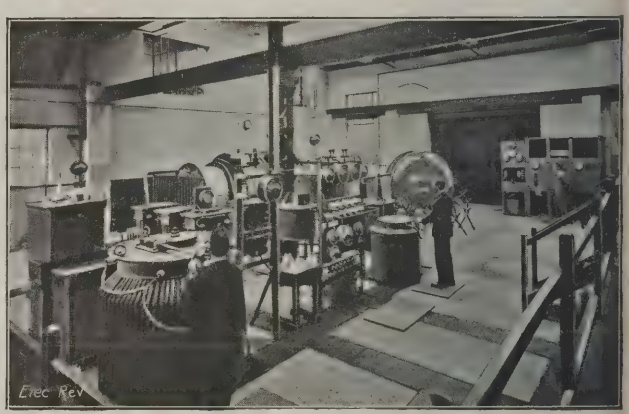

Fig. 6.—One of the Cable Testing Rooms.

gear to that of cables; at the time of a recent visit the transformer shop, of which we give a view in fig. 3, appeared to be working at its maximum capacity, a large proportion of the output being for export. Moreover, as our pages have witnessed, the company adopts an enlightened attitude with regard to the communication of technical infor-

Fig. 7.—Canteen.

mation on the design of transformers to the world in general. Fig. 4 shows a section of the switchgear shop, where are manufactured various types of switchboards for power stations and sub-stations. Ammeters, voltmeters, and frequency meters are included in the company's products.

Many large home and oversea contracts have been carried out by Messrs. Johnson & Phillips, involving the erection of overhead transmission lines, which naturally fall within the bounds of their chosen field of work. An example of a 33,000-V three-phase overhead line of their construction is shown in fig. 5, and on a later occasion some particulars will be given of the important share that they have borne in the cabling of the Southern Railway which, though not overhead, is generally overground. For use with their aerial lines they have developed pole-mounting transformers and suitable switchgear.

Special attention is given by the company to the development of export trade, particularly within the Empire, with marked success; from 25 to 30 per cent. of the turnover is for export; but the home trade is not neglected. Large contracts with the postal authorities at home and in the British Dominions are being fulfilled, and the contract for cables for the South-Eastern section of the Southern Railway is said to have been the largest of its kind yet placed in connection with railway electrification. Recent orders for transformers and switchgear have been received from a score of countries overseas, and overhead lines have been under construction in many parts of this country. Record figures were reached last year, and there are good prospects that the current year will beat them. It will be seen, therefore, that this concern though old in years is young and vigorous in spirit, and may look forward to the completion of another half-century with the confidence born of conscious integrity and strength.

Contracts Open and Closed.

(The date given in parentheses at the end of the paragraph indicates the issue of the "Electrical Review" in which the "Official Notice" appeared in our advertisement pages.)

Open.

Australia.—SYDNEY.—September 14th. New South Wales Public Works Department. Electrical equipment, machinery, &c., for bascule bridge over Cook's River at General Holmes' Drive.*

September 21st. Material and apparatus for complete communication system, Barrenjack hydro-electric scheme.

MELBOURNE.—Postmaster-General's Department. August 11th. (Sched. C. 26), plugs and sleeves (switchboard). (Sched. C. 25), switchboard cords.

September 15th. Lamps, lamp caps, and lamp sockets. Tender forms from High Commissioner, London.

September 14th. State Electricity Commission. 3,000 kVA transformers and spares.*

Barking.—July 28th. Electricity and Tramways Department. One 1,000-kW and one 500-kW rotary converters, with oil-cooled transformers and synchronising panels or, alternatively, one 1,000-kW and one 500-kW motor-converters (La Cour type), with starting and synchronising panels, e.h.p. switchboard, 3-wire d.c. switchboard and traction board. (July 10th.)

Bristol.—August 10th. Docks Committee. Four 3-ton movable electric jib wharf cranes for the Royal Edward Dock, Avonmouth. Spec. (£3) from Mr. T. A. Peace, chief engineer, Avonmouth Docks.

France.—July 31st. French Ministry of War (Service de Genie) in Paris. 1,500 metres of 26-pair conductor lead-covered cable and 1,000 metres, with 14 pairs of conductors. Particulars from Etablissement Central du Materiel de la Telegraphie Militaire, 51, bis Boulevard de la Tour Maubourg, Paris.

Grimsby.—August 1st. Electricity Department. Storage battery, booster, and switchgear. (July 10th.)

Steel lamp standards. (See this issue.)

India.—August 5th. India Store Department. Electric ceiling and table fans. (See this issue.)

August 11th. 313-kVA 3-phase alternators and exciters and accumulator cells. (See this issue.)

London.—ST. PANCRAS.—September 3rd. Electricity Department. One 10,000-kW steam turbine, alternator, condensing plant, pipes, &c. (July 17th.)

BETHNAL GREEN.—July 20th. Electricity Department. L.p. cables and switchgear. (July 10th.)

ST. MARYLEBONE.—August 31st. Highways Department. One 200-kW turbo-alternator set with surface condenser and auxiliaries; one second-hand 200-kW, 200/220-V d.c. generator set. (July 17th.)

H.M. OFFICE OF WORKS.—July 31st. Incandescent lamps. (July 17th.)

Manchester.—August 7th. Electricity Department. Three-phase, 6,600-V switchgear for Dickinson Street and 6,600-V switchgear for Bowker Vale. (July 17th.)

August 18th. One water-tube boiler, &c. (See this issue.)

Motherwell and Wishaw.—The Corporation is inviting tenders for electric lighting work at 128 houses. Particulars from Director of Housing, Motherwell.

New Zealand.—MARLBOROUGH.—September 22nd. Electric Power Board. Turbines, generators, and switchgear. (B.X. 1,904.)*

Newport (Mon.).—August 15th. Electricity Department. Ferro-concrete foundations for a 10,000-kW turbo-alternator and condensing plant, and one 49/50-ton engine-room crane, &c. (See this issue.)

Nottingham.—August 7th. Electricity Department. One 20,000-kW turbo-alternator, with exciter, condenser, air pumps, oil coolers, air coolers, and auxiliary plant. (July 17th.)

Oban.—August 4th. Town Council. Electric lighting work at six blocks of houses. Specifications from Burgh Surveyor.

Preesall.—August 17th. Urban District Council. E.h.p. 6,600-V cables, l.p. distribution and service cables, including excavation and reinstatement. (See this issue.)

South Africa.—JOHANNESBURG.—August 1st. Municipal Council. Twelve a.c. power relays.*

September 3rd. South African Railways and Harbours. Five 4-wheeled traversers and two tractors.*

*Further particulars can be obtained at the Department of Overseas Trade (Inquiry Room), 35, Old Queen Street, S.W.1.

Closed.

Bedford.—Electricity Committee. Accepted:—

Three rotary converters (£3,926).—Crompton & Co., Ltd.
Rotary feed pump (£249).—W. H. Allen, Sons & Co., Ltd.

Boston.—Town Council. Accepted:—

Installing electric light at the Assembly Rooms.—J. & S. Farr, Ltd.

Bradford.—Tramways Committee. Accepted:—

100 steel tramway tires (£230).—Hadfields, Ltd.
24 gear wheels and 30 pinions (£183 18s.).—A. Wiseman, Ltd.
500 lap-welded steel poles (£2,750).—Stewarts & Lloyds, Ltd.

Board of Guardians. Recommended:—

Radiological apparatus for St. Luke's Hospital, £977, Newton & Wright, Ltd.; £280, Watson & Sons, Ltd.; and £996, General Radiological Surgical Apparatus Co.

Bromley (Kent).—

Installing electric light at Christ Church, Bromley Park.—G. J. Wade and Son.

Carlisle.—Electricity Committee. Accepted:—

Battery-charging motor-generator set (£226).—English Electric Co., Ltd.
Exciter armature (£97).—British Thomson-Houston Co., Ltd.

Croydon.—Farm Committee. Accepted:—

Substitution of electricity for gas power at Beddington sewage farm (£2,075).—J. & T. Robinson.

Electricity Committee.

Alterations and additions at High Street offices and showrooms (£9,994).—E. H. Smith. (Accepted.)
Two 50,000-lb. Clayton-type boilers, with stokers, &c. (£36,424), buildings and foundations (£19,765).—Babcock & Wilcox (recommended).

Tramways Committee. Accepted:—

Points, crossings, &c. (£2,491).—Hadfields, Ltd.

Government Contracts.—The following Government contracts were placed during June, 1925:—

ADMIRALTY (CONTRACT AND PURCHASE DEPARTMENT).

Galvanometers.—Elliott Bros. (London), Ltd.
Motor alternators and spares.—E. N. Bray, Ltd.; Crompton & Co., Ltd.; G. Kent, Ltd.; W. Mackie & Co.; Small Electric Motors.
1,500-kW motor converter, &c.—British Thomson-Houston Co., Ltd.
Motor-generator sets.—Metropolitan-Vickers Electrical Co., Ltd.
Starting resistances.—Whipp & Bourne, Ltd.
Switches.—General Electric Co., Ltd.; Hawkers, Ltd.
Change-over switches.—General Electric Co., Ltd.; Whipp & Bourne, Ltd.
Electric tractors.—Electromobile, Ltd.
Wireless apparatus.—Dorman & Smith, Ltd.; Gambrell Bros., Ltd.; Park Royal Engineering Co., Ltd.; Radio Instruments, Ltd.; H. W. Sullivan, Ltd.; Veritys, Ltd.
X-ray apparatus.—A. E. Dean; Newton & Wright, Ltd.

WAR OFFICE.

Batteries.—Pritchett & Gold & E.P.S., Ltd.
Electric cable.—Fuller's United Electric Works, Ltd.
Electric cells.—Edison Swan Electric Co., Ltd.; General Electric Co., Ltd.; Siemens Bros. & Co., Ltd.
Rotary converter.—English Electric Co., Ltd.
Economiser.—E. Green & Son, Ltd.
Electricity meters.—Ferranti, Ltd.; General Electric Co., Ltd.
Electric lamps.—British Thomson-Houston Co., Ltd.; Cryselco, Ltd.; General Electric Co., Ltd.; Stella Lamp Co., Ltd.
Turbo-alternator.—Metropolitan-Vickers Electrical Co., Ltd.
Electric lighting installation, Devonport Military Hospital.—C. H. Robinson & Son.

AIR MINISTRY.

Underground cables, Tangmere.—Watshams, Ltd.

POST OFFICE.

Telephone apparatus.—Automatic Telephone Mfg. Co., Ltd.; Bonnella Bros., Ltd.; British L. M. Ericsson Mfg. Co., Ltd.; General Electric Co., Ltd.; Siemens Bros. & Co., Ltd.; Sterling Telephone and Electric Co., Ltd.; Western Electric Co., Ltd.

BATTERSEA.—Electricity Committee. Accepted:—
Three 25-kVA balancers, with kiosks (£120).—Hackbridge Electrical Construction Co.

Lamp Contracts.—The London, Midland and Scottish Railway Co. has placed contracts for six months' supplies of electric lamps with the General Electric Co., Ltd., and the Edison Swan Electric Co., Ltd.

The Aberdeen Line has renewed its contract for Siemens traction lamps with the Siemens & English Electric Lamp Co., Ltd.

Lyme Regis.—Corporation. Accepted:—
Two 75-kW generators for the electric power station (£2,930).—General Electric Co., Ltd.

Weymouth.—Housing Committee. Accepted:—
Electric lighting on the Westham estate (£312).—W. J. Warren & Sons

The "Electrical Review" Service Department.

INQUIRIES must be accompanied by a stamped addressed envelope.

We should be glad to learn the names of makers or suppliers of:—

FAMOS vacuum cleaners.
Pigskin electric lamp shades.

Notes.

Gas v. Electricity.—At the invitation of the directors of the Gas Light & Coke Co. some 300 members of Chambers of Commerce inspected the Beckton works on July 16th. After luncheon, Mr. D. Milne Watson, M.A., LL.B., D.L. (President of the National Gas Council), said he had a shrewd idea that the electricity undertakings were after the gas companies' business; they were not satisfied with power and light, most of which was supplied by them; they wanted the cooking and heating load as well, and that was exactly where the gas companies were up against them. It might be thought they were animated by a spirit of hostility to electricity. That was not true, for they used electricity in their gas works for a number of purposes. The Government, however, seemed to think that it was its special duty at the present moment to boost electricity. This was not a mere whim, but a course that had been advocated by previous Governments. To him it did not seem wise to boost electricity at the expense of gas, or the best way of overcoming the unemployment difficulties of the country, particularly in view of the fact that gas was at present so largely used. If there was any artificial boosting of electricity at the cost of gas, the people's gas would cost them more, though their electricity might cost them less.

New Insulating Material.—A new company named Aktiebolaget Isoleringsmaterial at Noortaelje has started the production of an insulating material called "Sphagni" according to a method invented by the Swedish engineer, M. Bagge. The raw material used is common white moss, which is found in very large quantities on the Swedish peat moors. The moss is dried and then pressed into paper-covered cakes. The cost of production is said to be very low.—*Reuter's Trade Service* (Stockholm).

Fatalities.—An inquest into the death of Leslie R. Bastock an employé at the Staveley Works, near Chesterfield, was held last week. A witness said that he found the deceased lying with his right hand on the switch of an electric motor. He tried to pull him off, but the shock knocked him backwards, and he then ran to the power-house to have the current cut off. A doctor said that artificial respiration was carried on for two hours, but without success. Death was due to paralysis of the respiratory organs. Charles Dissington, electrical engineer, stated that he examined the motor less than an hour after the accident, and found it perfect, but there was a leakage in one of the rods inside the switch. The earth wire had been broken and had evidently been twisted together by an amateur, without being reported to him. The insulation defect in the switch was so small that it was difficult to see. The pressure on the switch was 440 V a.c., and the voltage to earth 240 to 245. A verdict of "Accidental death" was returned.

On July 17th, Andrew Jones, who was engaged in repairing an overhead transmission line at Pentre, South Wales, received a fatal electric shock, while his companion, H. Wallis, sustained a slight shock.

Static Electricity.—At the conference of the Institution of Fire Engineers, held in Edinburgh, a paper was read by Mr. A. M. Cameron, A.I.Fire E., Lasswade, on "Some Notes on the Fire Hazard due to the Development of Static Electricity during the Storage and Use of Inflammable Liquids," a subject that had been given much attention in America, but had been somewhat neglected in this country. A number of delegates having expressed their views on the subject, Mr. Cameron stated that the Institution might gather together all the authenticated cases and have them published.

Czecho-Slovakian Electrical Engineers.—The annual congress of the Union of Czecho-Slovakian Electrical Engineers was lately held at Banska-Bysterica, when among the papers read was one on "The Electrification of the Czecho-Slovakian State Railways," and one on "The Construction of Super Power Stations."

A North Met. Anniversary.—To celebrate the supply of electricity to the British Empire Exhibition (1925), and incidentally its 25th year of activity, the North Metropolitan Electric Power Supply Co. entertained representatives of local authorities, large consumers, purchasers in bulk, and others in its area, to luncheon at the Garden Club, Wembley, on July 15th. The chairman, Sir James Devonshire, K.B.E., occupied the chair, and following the loyal toast he proposed "Electricity and Development," referring to the history of his company and its steady growth since its inauguration in 1900. It had been entrusted by Parliament with an area of 326 square miles in Hertfordshire, Middlesex, and Essex, supplying over 19,000 consumers direct and over 47,000 directly and indirectly. In other words, its development has been from less than 2 million kWh in 1904 to nearly 100 millions in 1924, while Royal Assent had recently been given by an Act of Parliament which extended the company's area by 230 square miles.

All this had been done with a capital expenditure of £2,331,000, of which £973,000 (or 42 per cent.) had been spent on buildings and generator plant; £389,000 (or 17 per cent.) on main transmission lines; £895,000 (or 38 per cent.) on distribution, the remaining £74,000 (or 3 per cent.) representing miscellaneous expenditure.

The company possessed four power stations; the first was opened at Hertford in 1901; in 1904 a supply from Brimsdown was commenced, while in the same year a power station was purchased from the Willesden U.D.C. and the St. Albans station commenced to supply in 1908. The stations were mostly interconnected and their total capacity was 50,000 kW. The company's system was interconnected with those of Luton and Hackney, and a link was now being laid to the new Barking station of the County of London Company, while the above-mentioned Act of Parliament authorised the erection of a new station at Brimsdown.

The districts served by the company numbered 26, with the aid of 182 miles of e.h.p. trunk lines underground and 1,400 miles overhead, in addition to 412 miles of h.p. and l.p. distributing mains underground. Seven authorised distributors purchased the whole of their supplies from the company, and in addition bulk supplies were furnished to the Metropolitan Electric Tramways, Ltd. Wiring installations of all descriptions were undertaken by the company at each local undertaking, showrooms being in existence in nine districts, and two more were to be opened in the near future at Edgware and Harpenden.

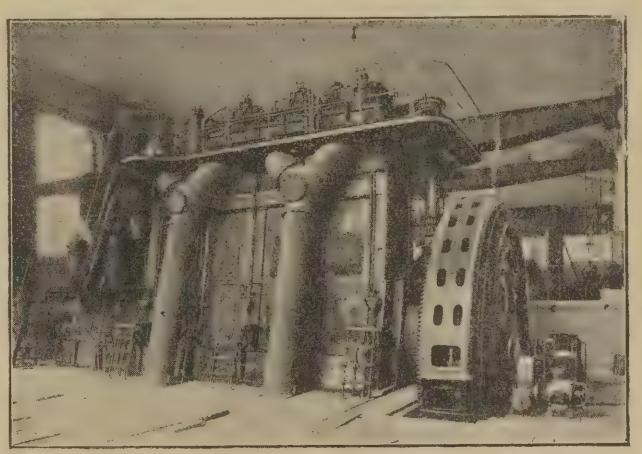
The toast was responded to by County Alderman B. Todd, J.P., chairman of the Middlesex County Council, who referred to the benefits that many had received by purchasing energy in bulk from the company. He emphasised the responsibilities of those companies which undertook to supply in bulk, and hoped that they would be able to enjoy a reduction in price in the near future.

Miss C. M. Eve, J.P., Mayor of Stoke Newington, also responded, as also did Sir Herbert Nield, K.C., M.P., vice-chairman of the Lee Conservancy Board, who referred to the efforts which had been made to stampede the country into believing that the Government was to subsidise the electrical industry.

Norway Water Shortage.—The *Financial Times* says that reports from Bergen indicate that the water shortage in Norway has become so acute that numbers of hydro-electric undertakings are apprehensive of a complete stoppage. The majority of companies have already reduced the supply of electrical energy.

The Supply "Change-over" of the Dick-Kerr Works, Preston.—We have received some interesting particulars respecting the supply change-over of the above works of the English Electric Co., Ltd., from its own generating station to the new Ribble power station of the Preston Corporation.

The Dick, Kerr works power station consisted of a 750-kW and one 250-kW reciprocating engines, a 1,500-kW steam turbine-driven generator, and two Babcock & Wilcox and four Lancashire boilers. The conversion to the Corporation supply meant the scrapping of the whole of this plant, together with the existing switchboards, and the installation of a joint sub-station, which is now being effected.



The works were driven throughout by d.c. motors, and it was decided to convert to a.c. all motors where a reasonably steady load was assured in the electrical works and the car works, to scrap the whole d.c. plant and change over completely to a.c. For machine drives, squirrel-cage a.c. motors (three-phase) have been installed, and for lighting, the d.c. wiring has been utilised and balanced between the phases.

Thirty motors, aggregating 600 h.p., in the electrical works, have been changed to a.c.; and in the car works 54 motors, amounting to 585 h.p., are gradually being changed.

The joint sub-station plant to supply the English Electric Co.'s works, as well as the Docks and Marsh Lane areas, consists of two 500-kW rotary converters, with transformers and switchgear on the Corporation side, and one 1,000-kW rotary converter, one 1,000-kW, 6,600 to 420-V transformer, and one 1,400-kW motor-generator for special heavy testing work. The switchboards have been so arranged that one 6,600-V feeder from the Ribble power station supplies the English Electric Co.'s machines, and another the Corporation machines; but the switching of motoring arrangements are such that the Corporation d.c. mains can be fed from the English Electric machines, or *vice-versa*.

The position to-day is that the whole of the power for the works is supplied by the Corporation. The conversion of the building from a generating station to a converting sub-station, and the changing of the motors has been effected without in any way affecting the continuous operation of the factory. Before an engine could be removed it was necessary to arrange for a temporary supply by using one of the machines in the testing department; and in view of the fact that the cellar contained the steam pipes it was necessary to lay the h.p. incoming cables along the floor until such a time as the steam pipes were removed. As soon as this was operating satisfactorily it was possible to remove the vertical engines. The whole of the work in connection with the conversion will be completed before the winter load comes on. In the changing of the shop drives it has in most cases been possible to erect the a.c. motor on a different site from the d.c. motor, so that the change in the drive is only a matter of fitting a belt on the new motor during the meal hour. In those cases where it has not been possible to arrange a new site for the motor it has been necessary to work on Saturday afternoons to carry out this work.

A Large Diesel Stand-by Plant. — To enable it to meet heavy peak loads on its hydro-electric undertaking as well as to act as a stand-by plant in case of emergency, the Berne Municipality has recently installed a 4,000-b.h.p. Diesel-electric plant at its Marzili power station. The undertaking was already provided with steam-turbine stand-by plant, but this will only now be used when the Diesel sets prove insufficient to meet the load. The installation is in two sets each of 2,000-b.h.p., consisting of a two-cycle, 136 r.p.m. Diesel engine, by Messrs. Sulzer Frères, coupled to a flywheel alternator generating three-phase, 50-cycle current. At the outset the sets are required to supply 40-cycle current and the engines are therefore run at 109 r.p.m., developing 1,600-h.p. Tests carried out with the engines running at this speed showed a consumption of 0.418 lb. of fuel per h.p.-hour at full load; 0.423 lb. at three-quarters load; 0.455 lb. at half load; and 0.575 lb. at

Diesel Stand-by Plant at Berne.

quarter load. The guarantees were respectively 0.429 lb., 0.440 lb., 0.484 lb., and 0.660 lb. per h.p.-hour. The foregoing figures all relate to fuel of a lower calorific value of 18,000 B.th.u. per lb.

The accompanying illustration shows the first set in position, and, in the foreground, the foundations for the second set. The first was put into commission in November, 1924, while the other commenced running in February last.

Submarine Diesels at Loughborough.—Two Diesel engines taken from German submarines and presented by the Admiralty to the electrical engineering department of Loughborough College, have been adapted for use in connection with the scheme of that college to provide its own electricity supply. One is of 1,850 h.p., and the other 500 h.p. The engines had been made unworkable by the Germans, and the task of re-assembling them has been a formidable one, but, nevertheless, it has been a valuable experience for the students. A very cheap and crude oil is being successfully used for running the engines. The switchgear has been collected from various submarines. When the new power house is completed it will supply the whole of the college buildings, the current being conveyed by overhead wires.

Illuminations on Southend Pier. — This year visitors to Southend will find the illumination of the pier, pierhead, bandstand and dancing pavilion, to be on an altogether more elaborate scale than in the past. It is at the pierhead where the most extensive additions and alterations have been made to last season's illuminations. Festoons of white light in the foreground are supported by posts which are surmounted by G.E.C. fittings and flambeau shades; each shade accommodates a green or flame coloured sprayed lamp. In the dancing pavilion the bandstand is outlined with clear lamps; streamers of clear lamps also radiate from a central four-tier corona of lamps over the dancing floor to the bandstand and the sides of the pavilion. The installation of a number of "Wembley" lanterns illuminating the whole of the dancing floor has proved to be extremely satisfactory.

Electricity on Board Ship.—An interesting event took place at Belfast on the 7th inst. that is, the launch from Messrs. Harland & Wolff's East Yard of the Royal Mail passenger motor liner *Asturias* (22,000 gross tons). The new vessel marks an epoch in the progress of naval architecture, for she is the largest and most powerful motor vessel in the world (with her two Harland-B. and W. 8-cylinder double-acting oil engines. Needless to say, elecfricity is used largely; there are 400-kW Diesel-driven generators and one 75-kW Diesel-driven emergency generator. There will be some 4,000 lights in all, together with the usual navigation lights with Morse lantern and the high-angle-power lamps and lanterns for working of cargo. A feature of the ship will be the ample ventilation which is so necessary in warm climates, there being over 50 large fans for delivering cold air to the accommodation, in addition to more than 500 cabin and ceiling fans distributed throughout the staterooms and public rooms. The heating throughout will also be electric, there being some 500 heaters in the public rooms and the accommodation. The cooking ranges for passengers and crew will be electric. There will also be two large electrically-heated bakers' ovens, in addition to salamanders, grills, toasters, griddle plates and fish friers. In the dining saloon electrically-heated *rechaud* stands are distributed at intervals in way of the tables.

In the hospitals and barbers' shops large sterilisers will be installed; the barbers' shops will contain electrically-heated hair driers and machines for the application of vibro-massage.

On the decks the electrical equipment includes a 135-h.p. warping winch, two 150-h.p. capstans, and 136-h.p. windlass, together with the motors for the electro-hydraulic steering gear. The watertight doors are electrically operated and controlled from the captain's bridge, where an indicator shows their position at any time.

There are no less than seven electrically-operated lifts and hoists and the following service machinery:—Two mincing machines, one cake whisk, one coffee mill, one bacon slicer, one ice-cream machine, four plate washers, three potato peelers, two dough mixers, one printing machine, one laundry motor, one gymnastic motor, and one photographic printing machine for the dark room.

A complete system of bells and telephones is installed throughout the vessel, and an up-to-date equipment for wireless telegraphy has been fitted both on the ship and the motor lifeboats.

Electricity Supply Rifle League.—The following are the results of the June matches:—*1st Division:* Central A 591, St. James' 573; Central A 589, County 589; City A 578, Central B 561; Shoreditch A 584, Central B 563; Shoreditch A 587, St. James' 557; County 586, City A 577. The Central A team heads the list with nine points. *2nd Division:* Central C 574, City B 573; Central C 569, Shoreditch B 562; City B 573, Epsom 474; Hackney 541, Epsom 444; St. James' A 529, Shoreditch B 515; St. James' A 536, Epsom 412. The Central C team heads the list with 10 points.

Electric Vehicles in the Vienna Postal Service.—At a recent meeting of the Austrian Motor Engineers' Association, Herr Ing. Josef Altmann gave particulars of the electric and petrol vehicles used in connection with the postal service in Vienna. At the present time 26 electric vehicles, built by the Austrian Daimler Motor Co., and 35 petrol vans and trucks constructed by the Austrian Fiat Co., are in service, the "electrics" having a carrying capacity of 1½ tons and the petrol vehicles two tons. The electromobiles are each fitted with compound four-pole motors rated at 6 h.p. at 1,250 r.p.m., driving the rear road wheels through gearing and chains. The controller is adapted to give three speeds, with a maximum of approximately 12 m.p.h. The battery consists of 80 cells, supplied by the Akkumulatorenfabrik Gesellschaft, of Vienna; they have a capacity of 200 amp.-hours and weigh, with their receptacle, about 24 cwt. Owing to the bad hilly roads in the Vienna district, the mileage per charge amounts to only from 25 to 35 miles. For charging the batteries, a special installation was put in for the postal authorities by the A.E.G. Union Electricitäts Gesellschaft. The available 5,000-volt a.c. is stepped down to 380 V by means of six transformers of a total capacity of 400 kW, and converted to the desired battery-charging voltage by 26 mercury-vapour rectifiers. The latter are said to work at 88 per cent. efficiency, their glass bodies having a useful life of from 2,500 to 4,000 hours. Special provision is made for the rapid substitution of charged for discharged batteries; in front of each charging board is a pair of rails on to which the little battery-carrying trolleys can be run in front of a charging board. Along the length of the battery-charging room, at right angles to the other rails, is a set of rails running to the electric vehicle garage on which runs a special trolley capable of carrying two of the battery trolleys. The main trolley, together with an auxiliary one, is run under the vehicle and, by means of special gear, a battery box is quickly released and dropped into position ready for transport to the charging room. At the same time another trolley brings a fully-charged battery.

The records which have been kept indicate that on macadam roads the energy consumption of the vehicle works out at 85 watt-hours, and on asphalt roads at 77 watt-hours per ton-kilometre. In the case of vehicles provided with ball instead of plain bearings, the figures are 77 and 61 watt-hours respectively. Experience has also shown that the positive plates of the batteries have a life of from 4,300 to 4,400 miles, and the negative plates from 8,500 to 8,800 miles. Owing to the greater tare weight and the high cost of electricity in Vienna at the present time, the running costs of the electromobiles are stated to be higher than those of the petrol vehicles. Efforts are, however, being made to reduce the costs not only of electricity, but in other sections of the electrical department, notably in connection with mercury-vapour rectifiers, as a result of which it is anticipatesd the electric vehicles will be able to show results contrasting more favourably with the petrol type.

Island Falls Plant, Canada.—According to the *Electrical News*, Toronto, the plant of the Island Falls, which has been purchased by the Abitibi Pulp & Paper Co. from Hollinger Gold Mines, Ltd., is to be completed to capacity. The order has already been placed for the installation of the two remaining generators. These will be supplied by the Canadian G.E.C. and will have a capacity of 12,000 kVA, operating at 128½ r.p.m. The two machines already installed are 25 cycle, but the two units outstanding will be 60-cycle machines. They are all of the vertical type with direct connected exciters. The wheel pit for No. 3 was completed in the original construction, and the excavation was completed for No. 4. The two final machines will be ready for installation early next year.

Boiler Explosion Report.—We have received a copy of the Board of Trade report of the preliminary inquiry into the explosion at a steam trap at the Great Western Railway power station, Park Royal. The explosion is attributed to the abnormal stresses to which the metal of the cover was subjected when its securing nuts were tightened. Examination of the fractured portions suggested that the cover had been working in an unsafe condition for a considerable period prior to the explosion, and that, when the cover was last rejointed, these fractures were either extended or the remaining metal was subjected to such an abnormal stress that it could not withstand the normal load. Both the existing and final fractures are attributed to the design of the joint. The owners and makers have substituted a design of cover in which the jointing material extends over the whole width of the flange.

Institution Notes.

Institution of Electrical Engineers.—NEW MEMBERS OF COUNCIL.—The following gentlemen have been duly elected members of the I.E.E. Council:—*President*: Mr. R. A. Chattock. *Vice-Presidents*: Lt.-Col. K. Edgcumbe, R.E. (T.A.), and Prof. W. M. Thornton, O.B.E., D.Sc. *Hon. Treasurer*: Mr. P. D. Tuckett. *Members of Council*: Prof. C. L. Fortescue, O.B.E., M.A., Messrs. R. W. Paul, C. Rodgers, S. J. Watson, R. Grierson, Major E. O. Henrici, R.E. (ret.), and Messrs. J. W. T. Walsh, M.A., M.Sc., and E. Leete.

Whitworth Society. — SUMMER MEETING. — The second summer meeting of the Society was held on July 17th. A number of members took tea together at the British Empire Exhibition, Wembley, and in the evening nearly fifty of them dined together at the Holborn Restaurant. The chair was taken by the retiring president, Mr. R. B. Buckley, C.S.I. (senior Whitworth scholar) who installed the new president, Mr. Wm. Sisson (Wh.Sc., 1874). There are now 465 members on the roll.

Our Personal Column.

(Electrical men are invited to enable us to keep readers of the "Electrical Review" posted concerning their movements).

The Salaries Committee of Keighley Town Council recommends that as from April 1st, 1925, the salary of the borough electrical engineer (Mr. H. WEBBER) be at a minimum (without bonus) of £800 per annum, plus (1) £20 for every complete 1,000,000 kWh sold above 10,000,000 in each financial year; and (2) as from April 1st, 1926, £30 for every reduction of .03d. in the works costs in each financial year below the figure for the year ending March 31st, 1926.

From Berne we learn that the Swiss Federal Technical High School has lately awarded the title of Doctor to Herr EMIL HUBER-STOCKAR, of Zurich, as a mark of recognition of his work in connection with the development of electric traction and the electrification of the Swiss Federal railways, and to Herr ARTHUR NIZZOLA, president of the Motor Columbus Gesellschaft, of Baden, for his services in connection with Swiss hydro-electric development.

Prof. GUISEPPE PESSION, a captain in the Italian Navy, has lately been appointed General Director of the Post and Telegraph section of the Italian Ministry of Communications.

The degree of Doctor of Science has been conferred by Leeds University upon Mr. H. S. HOULDSWORTH, chairman of the Heckmondwike Council's Electricity Committee.

Since the death of Mr. W. J. Hudson, in May last, Mr. R. W. WEEKES has been carrying on for his widow till his affairs could be settled. Mrs. Hudson has now re-assigned the business to Mr. Weekes as from January 1st last. Mr. Weekes will continue to practise under his own name, and the name "Weekes & Hudson" will not be used any more.

Mr. T. G. HUNTER, formerly representative in South Wales for the Siemens & English Electric Lamp Co., Ltd., has joined Messrs. Johnson & Phillips, Ltd., as their cable sales representative for the southern counties (Hampshire, Sussex and Kent coast). Mr. Hunter will work in conjunction with Messrs. Johnson & Phillips's Portsmouth branch, having his headquarters at Southampton.

Mr. G. RABBITTS, head linesman on Sunderland Corporation tramways for the last 25 years, is leaving to take up an appointment in New Zealand, and has been presented by the Sunderland tramway employés with a wallet of Treasury notes.

Mr. C. BURGESS, manager of the Walsall Tramways since 1920, has secured an important appointment at Shanghai.

At Tuesday's meeting of the L.C.C. the General Purposes Committee brought forward a recommendation that Mr. J. K. BRUCE, the traffic manager, be appointed general manager in succession to Mr. A. L. C. Fell, who retired in December last. The salary proposed is £2,000, the amount which Mr. Fell was receiving. Mr. Bruce's present salary is £1,500 a year, plus a special allowance of £150 per annum while acting as general manager, plus bonus, making £1,856.

It is reported that Mr. H. W. WATTS, of Cheltenham, has been appointed electrical engineer to the Epsom Council.

We are pleased to report that Mr. E. HOLCOMBE HEWLETT, borough electrical engineer, Mansfield, who was taken suddenly ill on the Friday of the I.M.E.A. Convention, has, after a dangerous period during which his life was several times despaired of, now turned the corner and is approaching convalescence.

Mr. GUY BURNEY, retiring managing director of Sterling Telephone & Electric Co., Ltd., paid his farewell visit to Dagenham Works on Thursday last week. In his speech he thanked the employés for their efforts on behalf of the company. One of his chief regrets in severing his connection with the company was the parting with the staff and employés who had worked so well and loyally under him for so many years. Outlining the position of the telephone industry, Mr. Burney said that the domestic trade in which they had specialised for such a number of years was gradually declining, largely due to competition from the G.P.O., who were now giving such splendid facilities to subscribers that privately-owned intercommunication telephones were no longer in large demand. Unhappily the telephone manufacturers had only one customer for public exchange work, the competition for which was keen, with prices very lean. Touching on the future of the radio industry, Mr. Burney expressed the opinion that its future prosperity largely depended upon the attitude of the Board of Trade in regard to the application shortly being made to safeguard the industry against unfair foreign competition. He stated there was ample evidence that radio apparatus was being dumped into this country at prices approximately 50 per cent. below those at which the British manufacturer could afford to market them. German and Austrian telephones were coming in at an alarming rate, prices delivered averaging 6s. per pair. He had an example at 4s., and this was by no means a shoddy production. Foreign loud speakers were now increasing in numbers ranging from 16s. to £3 10s. retail. Components, too, were looming up large, such articles as transformers at 4s., variable condensers from 4s. 6d., &c. When it was realised that the cost of labour in Germany and Austria was between 45 and 50 per cent. below the British rates, it would readily be appreciated that the home manufacturers could not possibly compete. America and France were also doing their share of dumping. Trade unions, Mr. Burney remarked, saw to it that British labour received the union rates of pay, yet they did not appear to concern themselves about the vast influx of foreign goods manufactured in neighbouring countries by labour costing about half of that which we had to pay to British workmen. Such a state of affairs was lamentable, and the sooner the Government realised it the better. British labour must be protected if disaster to industry was to be avoided. At the conclusion of Mr. Burney's speech, he was presented with a silver salver by the employés.

The Shoreditch Borough Council Special Standing Joint Committee recommends that Mr. W. WEEKES, the present chief assistant electrical engineer, be appointed borough electrical engineer on probation for a period of 12 months, as from the date of Mr. C. Newton Russell's retirement, at a salary of £850 per annum.

St. Marylebone Borough Council Electric Supply Committee recommends that special duty pay as follows be granted to the senior technical officers of the Electricity Department for the extra and valuable services rendered by them in connection with the two plant extension schemes adopted by the Council in 1919 and 1923, involving capital outlay of approximately £750,000:—Mr. C. H. SMYTH, chief electrical engineer, £750; Mr. F. B. LEONARD, chief assistant electrical engineer, £350; and Mr. F. SELLEY, mains and sales engineer, £200.

Obituary.—MR. H. BEVIS.—We regret to record the death of Mr. Henry Bevis, M.I.E.E., which occurred on July 16th at East Molesey. Mr. Bevis had been a sufferer for 2½ years He was managing director of Pirelli, Ltd., and of the Pirelli-General Cable Works, Ltd. The funeral took place on Monday afternoon at East Molesey Cemetery. Mr. Bevis was one of the well-known personalities of the electrical industry in its early days. He was born in 1865, and he joined Mr. (now Sir) Hugo Hirst in 1884 as assistant in the Electrical Apparatus Co., Ltd. When, two years later, Mr. Hirst joined Mr. G. Byng—a step which led to the formation of the General Electric Co., Ltd.—Mr. Bevis continued to manage the Electrical Apparatus Co. for a few years as an opposition concern, but in 1889 the company liquidated and Mr. Bevis then re-joined Mr. Hirst. For 17 years the closest collaboration existed, Mr. Bevis, under Mr. Hirst's leadership, taking a lion's share in the strenuous work attaching to the early development of the G.E.C. Whether it was selling, advertising, catalogue compiling, or manufacturing, Mr. Bevis was always ready to step into the breach, showing great ability and the utmost loyalty. He was one of those who realised the necessity for the Electrical Trades Benevolent Institution, took an active part in its inception and formation, and took the keenest interest in its welfare. He was also a firm believer in the value of electrical exhibitions. Mr. Bevis made a tour round the world in the early history of the G.E.C., and also visited the U.S.A. and the Continent very frequently. He was, in his time, one of the best-informed men on trade in the electrical industry both at home and abroad. About the year 1907, changes of policy of the G.E.C. decided Mr. Bevis to enter a new field of activity and he joined the Pirelli enterprise in this country, which was then closely allied with the G.E.C. For many years he acted as their managing director, playing a most prominent part in making its success. Unfortunately he broke down more than 2½ years ago.

Wills.—The late Mr. THOMAS DUNFORD of the Parsons Marine Steam Turbine Co., Ltd., left £5,611 net and £7,857 gross personalty.

Mr. H. J. COATES, works manager of the G.E.C. branch at Stoke, left £2,622 gross personalty.

New Companies Registered.

Vernita Scott, Ltd. (207,319).—Private company.—Registered July 16th. Capital, £1,000 in £1 shares. Objects: To carry on the business of manufacturers of, agents for, and dealers in lamp shades and stands, electrical apparatus and accessories, designers, decorators, architectural designers (interior and exterior), builders, contractors, &c. The directors are:—F. A. Basnett, 66, Mercers Road, Tufnell Park, N., building contractor; E. E. Vere de Lissa, 32, Gledstanes Road, Kensington, W.14, stockbroker. Secretary: F. A. Basnett. Solicitors: A. E. Samuels & Co., 36-38, New Broad Street, E.C.2. Registered office: 19, George Street, Manchester Square, W.1.

Curtis Manufacturing Co., Ltd. (207,288).—Private company. Registered July 15th. Capital, £6,000 in £1 shares. Objects: To adopt an agreement with F. C. Curtis and to carry on the business of electrical, mechanical, automobile and general engineers, machinists, sheet and metal workers, pattern makers, and manufacturers of electrical apparatus, &c. The directors are:—F. C. Curtis (permanent governing director), 94, Salusbury Road, Brondesbury, N.W.6; Gertrude Curtis, 94, Salusbury Road, Brondesbury, N.W.6; F. Rice, 47, Crediton Road, Kensal Rise, N.W.10. The governing director, whilst the registered holder of at least 50 per cent. of the share capital, shall be entitled by his will to nominate two directors as governing or ordinary directors so long as such proportion of the share capital forms part of his estate. Qualification, £20 shares. Remuneration as fixed by the company. Secretary: F. Rice. Registered office: 32, Spring Street, Paddington, W.2.

Tomlins, Ltd. (207,213).—Private company. Registered July 11th. Capital, £2,000 in £1 shares. Objects: To carry on the business of electrical engineers and fitters, manufacturers of and dealers in motors, dynamos, and electric, wireless and other appliances, &c., formerly carried on by F. E. Tomlins at 124, High Street, Tunstall, Stoke-on-Trent, as "Tomlins Brothers." The directors are:—F. H. Tomlins, 124, High Street, Tunstall, Stoke-on-Trent, electrical engineer; F. Whitaker, 54, Prestbury Road, Macclesfield, Cheshire, incorporated accountant; H. Boulnois, Hill Crest, Tunstall Road, Biddulph, Staffs., potter's manager. Qualification, 100 ordinary shares. Remuneration as fixed by the company. Secretary: F. Whitaker. Solicitors: Ellis & Ellis, Burslem. Registered office: 124, High Street, Tunstall, Stoke-on-Trent.

G. F. Cooksley & Co., Ltd. (207,289).—Private company. Registered July 15th. Capital, £1,200 in £1 shares. Objects: To acquire the business of an electrical engineer and contractor carried on by G. F. Cooksley as "G. F. Cooksley & Co." at 66, Charles Street, Cardiff. The subscribers (each with one share) are:—G. F. Cooksley, 43, Grosvenor Street, Cardiff, electrical engineer; J. Bromley, 199, Arabella Street, Cardiff, electrical agent. G. F. Cooksley shall be permanent director and chairman subject to holding 100 shares. Qualification of ordinary directors, 100 shares. Remuneration, £300 each per annum (chairman, £350). Secretary: J. Bromley, 199, Arabella Street, Cardiff. Solicitor: H. G. W. Saul, 33, Windsor Place, Cardiff. Registered office: 66, Charles Street, Cardiff.

Radio (Hove), Ltd. (207,257).—Private company. Registered July 14th. Capital, £600 in £1 shares. Objects: To adopt an agreement with T. W. Cutts, and to carry on the business of manufacturers of, agents for, and dealers in wireless broadcasting sets, appliances and parts, motor, electrical and general engineers, &c. The directors are:—E. R. Lees, 30, Gordon Road, Portslade, Sussex; H. W. Lees, Ousedene, Bognor; A. Aisbitt-Gibson, 8, Aymer Road, Hove. Qualification, £50 shares. Remuneration, £10 each per annum. Secretary: H. W. Lees. Solicitor: T. W. Cutts, 50, High Street, Bognor. Registered office: 10, Westbourne Place, Hove.

N. E. C., Ltd. (207,256).—Private company. Registered July 14th. Capital, £1,000 in £1 shares (900 8 per cent. preference and 100 ordinary). Objects: To acquire the business of an electrical contractor as now carried on by J. R. Bessant at Front Street, Wingate, Durham, and to carry on the business of electrical engineers and contractors, omnibus proprietors, automobile and motor engineers, haulage contractors, &c. The permanent directors are:—J. R. Bessant (managing director), 15, Welney Place, Birley Carr, Wadsley Bridge, Sheffield; F. Craft, Lyon House, Front Street, Shotton Colliery, Co. Durham; R. Bessant, 15, Welney Place, Birley Carr, Wadsley Bridge, Sheffield. Qualification, 10 shares. Remuneration, £5 each per annum (managing director, £260). Secretary: Eileen M. Gillatt.

Singapore Traction Co., Ltd. (207,278).—Registered as a public company on July 15th with a nominal capital of £400,000 in £1 shares (200,000 preference, 199,999 ordinary, and 1 management). The preference shares confer the right to a fixed preferential dividend at 7 per cent. per annum (non-cumulative until September 30th, 1925, but afterwards cumulative) and ranking first for return of capital. The ordinary shares take all the remaining profits which it shall be determined to distribute as dividend, and in a winding up take half of any surplus assets after providing for the claims of the preference shareholders. The management share confers no right to any dividend, but in a winding up takes the remaining half of the surplus assets. Objects: To acquire all or part of the undertaking, assets and liabilities of the Singapore Electric Tramways, Ltd., and the undertaking authorised by the Singapore Traction Ordinance, 1925, of the Straits Settlements, to adopt an agreement between Sir William Plender, G.B.E., of the first part, the Singapore Electric Tramways, Ltd., and the said Sir William Plender, as liquidator thereof, of the second part; J. E. Prestwich

of the third part; the Shanghai Electric Construction Co., Ltd., of the fourth part; and this company of the fifth part, to construct, maintain and work by horse, electrical, steam or other power, tramways, railways and other means of communication in Singapore and other parts of the Straits Settlements or elsewhere, and to carry on the business of tramway, railway, omnibus and car proprietors, carriers of passengers and goods, generators, accumulators and distributors of electrical energy for light, heat, motive power or otherwise, &c. The subscribers (each with one share) are:—L. W. Hawkins Basildon House, E.C., chartered accountant; R. S. Portham, 195, Strand, W.C., engineer; A. Bide, Basildon House, Moorgate, E.C., chartered secretary; H. Burfoot, 13, Worbeck Road, Anerley, S.E., registrar; H. Donaldson, 15, Worsley Road, Hampstead, N.W.3, chartered accountant; and two clerks. Minimum cash subscription, 7 shares. The directors are to number not less than three nor more than seven. No qualification required. Remuneration, other than any directors appointed by the subscribers and the managing director, £400 each per annum (chairman, £600). Solicitors: Linklaters and Paines, 2, Bond Court, Walbrook, E.C. Registered office: Basildon House, Moorgate, E.C.2.

Gaskell & Baggaley, Ltd. (207,330).—Private company. Registered July 17th. Capital, £150 in £1 shares. Objects: To act as merchants, manufacturers, and agents in the sale, purchase and manufacture of synthetic crystals and other products of a similar nature, capable of being used in connection with wireless telegraphic installations or telephony, &c. The first directors are:—F. H. Baggaley, 681, Ashton New Road, Clayton, Manchester, chemist; H. R. Gaskell, "The Laurels," Barrington Road, Altrincham, Cheshire, crystal manufacturer. Qualification, 5 shares. Solicitor: W. T. Rylande, 2, Rook Street, Manchester. Registered office: 70, Barton Arcade, Manchester.

Haworth & Williams, Ltd. (207,224).—Private company. Registered July 13th. Capital, £1,000 in £1 shares. Objects: To carry on the business of dealers in wireless receiving and transmitting apparatus and component parts, &c. The directors are:—G. A. Haworth, 13, Yorkshire Street, Accrington; H. G. Williams, 25, Marlborough Street, Accrington. Qualification, 100 shares. Secretary: G. A. Haworth. Solicitor: F. Rowland, 15, St. James's Street, Accrington. Registered office: "Ewbank House," 13, St. James's Street, Accrington.

Official Returns of Electrical Companies.

N.S. Battery and Equipment Co., Ltd.—P. B. Nevill, of 96, Old Broad Street, E.C., was appointed receiver by Order of Court dated June 26th, 1925.

Dowsing Radiant Heat Co., Ltd.—Satisfaction in full (1) on June 1st, 1919, of mortgage or charge dated August 30th, 1912, securing all moneys due or to become due from the company to the London and Provincial Bank, Ltd.; (2) on June 23rd, 1925, of trust deed dated July 29th, 1902, securing £10,000; and (3) on same date of assignment dated July 29th, 1902, executed pursuant to the said trust deed.

X. L. O. Co., Ltd.—Debenture dated July 9th, 1925, to secure £200, charged on the company's undertaking and property, present and future, including uncalled capital. Holder: Col. O. C. Sherwood, 10, Chelsea Park Gardens, S.W.3.

Sea Houses and District Electric Supply Co., Ltd.—Debenture charged on the company's undertaking and property, present and future, including uncalled capital, dated June 26th, 1925, to secure all moneys due or to become due from the company to the Bank of Liverpool and Martins, Ltd.

Insulated Cap and Rivet Co., Ltd.—F. W. Kellaway, of 112a, Junction Road, Upper Holloway, N.19, was appointed receiver and manager on July 7th, 1925, under powers contained in mortgage dated October 9th, 1923.

Baker & York, Ltd.—D. W. H. Phipps, of 15, Park Row, Nottingham, C.A., ceased to act as receiver for debenture holders on May 19th, 1925.

Berrite, Ltd.—Floating charge on the company's undertaking and property, present and future, including uncalled capital dated July 3rd, 1925, to secure all moneys not exceeding £6,000 for which the mortgagees may become liable by virtue of a guarantee given to the company's bankers. Holders: A. F. Berry, 50, Oxford Street, W., and G. Berry, The Lodge, Cowley, Middlesex.

Robins Wholesale Electrical and Wireless Co., Ltd. (formerly Robins Electrical and Wireless Depôt and Institute, Ltd.).—J. W. Williams, of 5, St. Andrew's Crescent, Cardiff, was appointed receiver and manager on July 10th, 1925, under powers contained in debenture dated April 17th, 1923.

City Notes.

Reports and Meetings of Electrical Companies; Dividend Results, &c.

Edmundsons' Electricity Corporation, Ltd.

The annual meeting was held on July 14th, Mr. P. D. Tuckett presiding. In moving the adoption of the report (*vide* our issue of July 10th, p. 68), the chairman said the profits had increased by £21,223, the net balance showing an increase of £16,424 after writing off last year's ordinary share issue expenses of £2,153 and providing for an additional income tax charge of £2,698. Both the gross trading profit and dividends and interest showed large increases, and it was their knowledge that they were likely to do so which encouraged them last year to restore to the ordinary shareholders the £2 per share previously written off, but although they hoped the profits would continue to expand, he would like them to realise that there was no prospect or possibility of their expanding to anything like the same extent as in the past year. Most of their older subsidiary companies were now paying substantial dividends which they could not expect to see increased much further, while the growing return from the more recent ones must necessarily be comparatively small owing to their investment in them being also comparatively small. They were able to maintain the 7 per cent dividend on the increased ordinary share capital. The schedule of investments showed a number of changes resulting in an increase of £13,608 in their share holdings and of £5,68 in their advances. Most of their older companies were now paying a reasonable return on their holdings, whilst they and the younger ones continued to make satisfactory progress. Last year, excluding the Lancashire Power Company, their connections increased by over 5,000 kW, of which a large proportion was for lighting, whilst they sold upwards of 1,100,00 kWh more for lighting and about 6½ million kWh more for power. Coal averaged 3s. a ton higher than in 1923, representing an additional cost of over £10,000, and there was a increase of about £4,000 in their wages bill. Their costs still averaged 100 per cent. or more over the pre-war level. They had, nevertheless, been able to make large reductions in their charges in a number of instances, and wherever the circumstances justified it they looked forward to making still further reductions. Taking the business as a whole he thought they had every reason to feel satisfied with the progress which had been made. He was anxious regarding the Government's avowed intention to assist the electricity supply industry. It had been their unhappy experience to suffer a great deal from legislative interference in the past and they inevitably viewed with misgiving the prospect of having their activities made the subject of the Government's experimental enterprise.

Fuller's United Electric Works, Ltd.

This company's report was briefly reviewed in our last issue (p. 108). The annual meeting was held on July 16th when Mr. F. R. Wade, O.B.E., who presided, said that continuous hard work and solidification had brought about a steady improvement in the company's affairs. It was satisfactory to note that business had been increased in the face of very adverse conditions. In the last four years the turnover had nearly doubled. It has been necessary to revise the methods of manufacture and during the past year £26,000 had been spent on new plant and the renewal of some of the old plant. This made the expenditure on this account £58,000 for the last two years. There were possibilities of considerable expansion in the future, but although the company was putting itself into a state of efficiency it had to be remembered that if the markets did not exist it could not hope for business. There was a very real danger of a collapse of British trade which no individuals could prevent. The company, however, had considerable fields before it and it must be prepared to finance the work when it was offered. Meetings of the holders of first debentures, income stock, and notes were being called to sanction powers of expansion. The National Bank of Scotland, the company's bankers, had agreed to advance the necessary funds on a prior lien and it was necessary to secure sanction to this. The appointment of Mr. R. P. Wilson, C.B.E., to the board was confirmed.

Notices have now been issued calling a meeting of the holders of the 7 per cent. income debenture stock for Monday next to consider a resolution for creating a prior lien debenture in favour of the company's bankers, the National Bank of Scotland, Ltd., for £75,000 to secure a working overdraft up to that amount on terms to include the complete redemption by March, 1931, at the rate of not less than £15,000 per annum; to increase the rate of interest on the first mortgage debenture stock from 6 per cent. to 6½ per cent. and on the income debenture stock from 7 per cent. to 7½ per cent.; and to arrange that no payments between April, 1925, and March, 1928, shall be made in respect of the redemption of the first mortgage debenture stock or of interest on the income debenture stock and notes, the available profits being retained in the business as working capital.

British Broadcasting Co., Ltd.

The annual meeting was held on July 16th, and Lord Gainford (the chairman), in presenting the report and accounts (*vide* our last issue, p. 109), said that the number of licences issued as at June 1st, 1925, was 1,371,581, an increase of 567,000 during the year. He considered that there were still many people evading the payment of the licence fee. The total receipts from the Postmaster General in the 2½ years to March 31st, 1925, were £666,00 Of this amount £612,000 had been expended in the provision of programmes. The surplus of £54,000 was sufficient to meet income tax and reserves and leave a small balance. They had a total capital commitment of £179,000. It was essential to provide more alternative programmes for the great majority of listeners; these proposals involved an expenditure of about £100,000. Out of every £100 spent by the company, the programmes and operating costs absorbed £85 7s. 6d.; administration £6 7s. 6d., and depreciation £8 5s. It was proposed to form a staff benefit fund.

Prospectus.—*North Somerset Electric Supply Co., Ltd.* The list of applications was opened last Saturday and is to close on or before to-morrow, in an issue of 55,000 ordinary shares of £1 each at par in this company. The profits set forth in the prospectus show continuous progress during the past five years. The number of consumers advanced from 872 to 1,1 during 1924, and during the first half of 1925 it has further increased to 1,360, while the revenue for the first half of 19 has increased by 25 per cent. as compared with the corresponding period of 1924. For the four years 1921-1924 the dividend on the ordinary shares was 6 per cent. per annum. The Electricity Commissioners have made an Order which awaits confirmati

by Parliament under which the company will have powers to supply electricity to rather more than a quarter of the county of Somerset. The purpose of the present issue is the extension of high-pressure mains in a southerly direction.

Anglo-American Telegraph Co., Ltd.—Interim dividends of 15s. per cent. on the ordinary stock and 30s. per cent. on the preferred stock have been declared for the quarter ended June 30th last.

Brazilian Traction, Light and Power Co.—The annual meeting of shareholders of the company was held in Toronto on June 15th. Mr. E. R. Wood, one of the vice-presidents, presided. The chairman said that the results of the year's operation should be regarded as satisfactory considering the unfavourable rates of exchange prevailing. In reply to questions asked by shareholders regarding the continuance of the drought, the chairman stated that there was little prospect of change until the next wet season about the end of the year, but that in the meantime the company was doing everything possible to alleviate the situation, and was proceeding rapidly with large new developments, which it was hoped to have completed within a year. The directors have declared a quarterly dividend of 1 per cent. on the ordinary stock.—*Financial Times.*

Stock Exchange Notices.—Dealings in the following have been specially allowed by the Committee under Rule 159:—

American Telephone and Telegraph Co.—$24,219,100 capital stock in shares of $100 each.

Shropshire, Worcestershire, and Staffordshire Electric Power Co.—17,375 6 per cent. cumulative preference shares of £1 each, fully paid, Nos. 1,110,001 to 1,127,375.

The undermentioned securities have been ordered to be officially quoted:—

Adelaide Electric Supply Co.—£350,000 5½ per cent. redeemable consolidated debenture stock.

Adelaide Electric Supply Co.—500,000 6½ per cent, "C" cumulative preference shares of £1 each, fully paid, Nos. 1 to 500,000.

Marconi International Marine Communication Co., Ltd.—The gross revenue for 1924, £976,359, was slightly higher than that of the preceding year, but the net profit, £83,576, was lower. The position is considered satisfactory having regard to the continued depression in the shipping world. It has been necessary to make provision for bad and doubtful debts. The dividend is reduced from 10 per cent. to 7½ per cent. and only £1,745 is carried forward, as against £7,623.

The meeting is to be held to-day (Friday).

Northampton Electric Light and Power Co., Ltd.—A special meeting of shareholders is being called to sanction the appointment to the board of Mr. H. G. Thornton, a director of the Wellingborough Electric Supply Co., and Mr. R. E. Lamb, a director of P. Phipps & Co.; and also to approve an increase in the directors' fees from £1,000 to £1,500 for the current year.

Marconi's Wireless Telegraph Co., Ltd.—A final dividend of 5 per cent. making 10 per cent. for the year 1924, has been declared on the ordinary shares.

County of London Electric Supply Co., Ltd.—The directors have declared interim dividends on the preference shares and one of 5 per cent. on the ordinary shares.

South London Electric Supply Corporation, Ltd.—An interim dividend of 5 per cent. has been declared on the ordinary shares.

General Electric Co. (U.S.A.).—The New York correspondent of the *Financial Times* reports that the company intends to retire $15,137,000 of outstanding 5 per cent. bonds, due September 1st, 1952, at 107½ per cent., with accrued interest.

Yorkshire (West Riding) Electric Tramways Co., Ltd.—An interim dividend of 2½ per cent., actual, has been declared on the ordinary shares.

Electrical Distribution of Yorkshire, Ltd.—A dividend at the rate of 7 per cent. free of tax, has been declared on the ordinary shares for the half-year.

Yorkshire Electric Power Co.—The directors have declared an interim dividend of 3 per cent. on the ordinary shares.

Calgary Power Co.—The surplus for the past year was $96,823 as against $30,791 in 1923.

Stocks and Shares.

Monday Evening.

The rubber share market again occupies the principal place in the Stock Exchange scene. There has been little diminution in the volume of business, and, although everyone is looking for a setback to occur, if only by reason of the furious pace at which the boom has proceeded, the public interest is maintained at a high rate. It is already beginning to affect other companies through the manner in which the price of raw rubber has risen. Various protests have been lodged against the manner in which, it is maintained, the price of raw rubber has exceeded legitimate bounds. In order to reduce the price, proposals have been put forward, by American buyers and certain British interests, that have for their object the removal of the restrictions at present limiting the output of raw rubber. The Government has declared that the rise in price is regarded by them as being temporary, and that they have no intention of legislating in regard to the restriction scheme. The India Rubber Manufacturers' Association has, however, issued a notice in which the removal of restriction is supported, and in the share market, a few small declines have occurred during the past few business days in the securities of those manufacturing companies which are large buyers of the raw material.

Henleys, for instance, are easier at 2 15/16. Electric Constructions are also 1/16 down at 31s. 3d. English Electrics went back to 18s. 3d. Siemens at 24s. 6d. are 6d. lower, and Metropolitan-Vickers ordinary gave way similarly to 20s. 9d. Shares in several other companies of similar character are slightly easier in tendency, although it is pointed out that the companies will probably pass on, at all events partially, to their customers the addition to costs which the rise in raw rubber entails upon them.

British Aluminiums are better at 30s. Brush strengthened to £1. Fuller's United Electric Works has issued a report in which the company's shareholders are asked to sanction an arrangement whereby the company's bank will advance, on a prior lien, the necessary money for expansion of the work in hand. The price of the ordinary for a long time past has been about 6d. per share, and the 8 per cent. non-cumulative preferences stand about 3s., while the 5 per cent. income-tax free short-term notes changed hands a few days ago at 21½. From which prices it will be observed that there is plenty of room for improvement, from the shareholders' point of view, in the value of their property. The report indicates that there is a reasonable promise of better things in the near future.

Electricity supply shares are quiet. Few changes have occurred in the London list, though Kensingtons at 12¾ have recovered the 7s. 6d. which they lost lately. London Electric preference eased off a little. Bournemouth & Poole are 1/16 higher. Edmundsons went back to 21s. 6d., a fall of 1s. 6d. The new County of London preference are what is called a good market. There is a close price between buying and selling, and the shares have been steadily bought since the market opened, the present price being 1s. premium over the issue price of 20s. 6d., at which the shares came out. No changes have occurred this week in the company's ordinary and senior preferences. Yorkshire Electrics gave way to 30s. There has been a little selling in this market of shares, the money from which was required to finance purchases of popular rubber issues. The third reading of the Summer Time Bill had no effect upon lighting shares generally, but prices have rallied from their recent worst.

The Home Railway market is dull. Dividend announcements are close at hand; the Metropolitan announcement comes on Thursday in this week. Underground Electric ordinary shares of £10 each gave way to 2⅜. Districts remain at 45, at which price the yield on the money is nearly 7¾ per cent. Southern Railway stocks are in a little demand, upon the extension of the electrification programme. Fresh weakness in London United Tramways preference has lowered the price to 4s. 6d. London General Omnibus income debenture, which was changing hands last week at 80, has strengthened to 83½. Yorkshire (West Riding) Trams at 17s. 6d. are 1/16 lower.

Marconi Marine has declared a dividend of 2½ per cent. as the final for the year, making 7½ per cent., against 10 per cent. in the previous twelve months, and 12½ per cent. in the year before that. The price of the shares has dropped to 18s. 9d. and Marconis, in sympathy, went down to 1⅜. The Marconi dividend should be out in a few days' time, and, in the light of the Marine Company's cut, it is feared that the parent concern may reduce its distribution to 7½ per cent. Canadian Marconis drooped to 4s. 1¼d. Cable stocks are quiescent. Anglo-American preferred and deferred have lost a little ground.

Brazilian Tractions continue to advance, and show another gain at 59. Anglo-Argentine 5 per cent. debenture shed 1½ points to 71½. Mexican issues are listless and inclined to be heavy. Engineering and allied shares keep moderately firm. Babcocks can be bought at 48s. 9d., the nominally middle price. The rubber market is very hard. City electric lighting Companies must regard with an air of benevolence the boom conditions that keep the lights burning, from sunset to daybreak, in a good many Stock Exchange offices this week.

Thanks are due, and hereby tendered, to a reader who courteously draws attention to a slip which occurred in our tables, in printing the last year's dividend on Siemens ordinary shares. The figure should have been 7½ per cent., instead of 5 per cent. as stated, and this gives a useful opening for a word explanatory of the method adopted here in presenting yields upon the officially-quoted prices. The Stock Exchange Official List sends out double prices, *e.g.*, Eastern Extension Telegraph shares, 16¾ to 17¼. The middle figure is 17, and upon this is calculated, in our tables, the return per cent. to an investor, taking the last year's dividend as the basis. Eastern Extension received 10 per cent. tax-free, upon its £10 shares, a rate which gives a buyer of the shares, at £17 per share, a yield of £5 17s. 8d. free of tax, upon each £100 of money spent on the purchase at this price. It may appear somewhat superfluous, or supererogatory, to enter thus closely into details that are perhaps obvious. In defence, the excuse may be ventured that the City mind is apt to take for granted a familiarity with mechanical matters which are not always clear to the man who stands a little outside the range of ordinary Stock Exchange affairs.

The Convention of the Illuminating Engineering Socie U.S.A.—The nineteenth annual convention of the Il minating Engineering Society, U.S.A., will be held dur the week of September 14th-18th at Detroit, Michigan, w headquarters at the Hotel Statler. A programme of papers being arranged by Mr. Frank C. Taylor, chairman of the Co mittee on Papers. A complete session will be devoted motor-vehicle lighting, with papers by a number of w known authorities, covering such topics as State regulat of head-lights, depressible beam head-lighting and the lat developments in traffic control systems. Another session v be allotted to a symposium on natural lighting, which will held under the leadership of the Society's Committee Natural Lighting. There will also be a symposium on re dential street lighting. Among the other topics which v be discussed are shop-window lighting, high-intensity ind trial lighting, floodlighting, computations, recent devel ments in neon lamps, and photometry of asymmetric lighti units. An entertainment programme of unusual interest being prepared by Mr. C. C. Munroe, Secretary of the Gene Convention Committee.

Platinum Finds in Africa.—According to the *Financ News* it is reported that a platinum gold reef, six miles lo yielding 8.80 dwt., has been found along Ngwenia Ran Swaziland. Prospecting operations in the Olifants River s tion of the Lydenburg Consolidated Platinum Mines prop ties disclose satisfactory values, including a chrome ore bo carrying high platinum values and a new upper reef much promise.

The Problems of Trade and Industry.

A Report on Overseas Markets. Manufacturers View Subsidies with Disfavour. Economic Influences.

"A Survey of Overseas Markets."

IS sub-title is the description of a volume published t week by the Committee on Industry and Trade.* The ncipal feature of the survey is a series of statistical articles ıling separately with the Dominions, Colonies, and foreign ıntries, considered primarily as markets for British goods. the first place figures are given of population and external de for the period, 1904-1913, and the latest available post- r year. The share of the United Kingdom in this trade shown in volume and percentage. The public finance of ch country is briefly dealt with and economic development ıtural resources, transport, national industry, &c.), is ated at some length. Industrial and commercial policy, in- ding tariffs and the fostering of industries, are then touched on. The competitive situation as regards commodities and ıntries is discussed at the end of each section. Another tion of the work compares pre-war and post-war customs ties and an attempt is made to estimate the overall change these tariffs to show whether increases (if any) have sed the average *ad valorem* incidence when the increased ue of goods is taken into account. The next chapter con- ns memoranda on foreign commercial policy affecting itish trade and includes such matters as commercial aties, most-favoured-nation practice, import restrictions, treatment of British shipping (in the light of measures opted by foreign countries to aid their own shipping indus-), &c. The volume includes a number of interesting statis- al tables. Among other things these show the external de of the United Kingdom over a series of years on the sis of 1913 prices; the share of the United Kingdom and ıer countries in world trade in 1913 and 1923; and the dis- bution of our external trade.

n an introduction to the report the Committee makes it ar that the volume does not pretend to constitute a report mulating definite recommendations; it is rather an attempt assemble the facts and to summarise the main features of extent and prospects of British trade in overseas markets. is shown that though, in sterling values, our proportion of world's export trade appears to have risen from 13 per ıt. in 1913 to 14 per cent. in 1923, the great reduction which occurred in the total world trade means a substantial luction in the volume of our trade. It is of the greatest portance to make a study of each group of markets to esti- te the weight of the various factors which are responsible the decline in our trade. These factors are:—(1) The de- ne of the purchasing power of the local populations; (2) The wth of local manufacture; and (3) The displacement of itish imports by those of other countries. The Committee nsiders that the first factor still exerts a considerable, though creasing, effect. The growth of local manufacture is per- ps the most important permanent factor tending either to nit the volume or to modify the character of British export de, and this factor is discussed at considerable length. The tial effect is to drive international commerce to the finer alities of manufacture, the home industry dealing with the npler and coarser classes of goods, and from this point of ew we should be in a favourable position on account of our gh reputation. Moreover, the local development of manu- tures must inevitably create an increasing demand for ods, and this country should be able to secure its share in satisfying of this demand. The Committee points out at such re-adjustments as will be necessary are bound to ake great and increasing demands on the foresight, intelli- nce and adaptability of those concerned in the export trade. e Committee next discusses the various means by which local nufacture is assisted in various countries. As regards cus- ns tariffs, the Committee states that, while these are with- t doubt an important obstacle to the flow of international de, it appears that taking British trade as a whole, the creases in tariffs which have taken place since 1913 have not far been an important factor in retarding the recovery of r trade.

As regards import prohibitions and restrictions, the Com- ttee emphasises their harmful effect on trade through the certainty with which they operate and the delays and diffi- lties which they cause, and it welcomes the tendency which making itself felt for the removal of these restrictions. ference is also made to the obstruction to trade caused by multiplication of customs and other similar formalities. e Committee is of the opinion that the parties to the inter- tional convention for the reduction and simplification of stoms formalities should expedite the general ratification the convention. In connection with special privileges, con- sions or subsidies for industry, the Committee points out at the widespread impoverishment and financial weakness lowing the war have deterred most governments from em- rking on large schemes of direct subsidy, but certain arrangements for assisting industry have been initiated in some countries. Among other things the preferential treatment of national shipping is mentioned and is deprecated. Under the heading of "State control or monopoly," the Committee indicates that, except as regards Soviet Russia, British trade does not appear to have been materially affected by an abnormal increase in such monopolies in recent years.

The last section of the introduction deals with foreign competition and shows that while some of our competitors have been strengthened others have weakened. It is thought that the recovery of Central Europe will eventually benefit British trade, but the rehabilitation of German industry, which is a necessary pre-requisite to the payment of reparations is likely to strengthen Germany's competition for some years. After a brief mention of preferences granted by the Dominions to British goods, the introduction concludes with a statement that it is essential that all concerned should strive to accommodate their outlook, their methods, and their organisation to the changed and changing conditions of world trade.

Subsidies for Industries not Desirable.

FOR a considerable time a Committee of the Federation of British Industries has been examining the various proposals which have been advanced for subsidising industry for the relief of unemployment. The Committee has now issued its report stating the conclusion that no subsidy of a general character applicable to a large number of industries is possible. It is inclined to be dubious as to the advantages of partial schemes especially adapted to particular trades, though the opinion is held that if suitable organisations could be devised for full and rapid consideration of the circumstances, the grant of occasional and temporary subsidies might prove of value in providing employment. Some of the difficulties and dangers involved in a policy of subsidies for general application may be stated here:—

Any general scheme of subsidies might result in many cases in subsidising the relatively inefficient firm to the detriment of the more efficient. It might also tend to deprive of subsidy those firms who had made particular efforts to reduce costs and keep their works running, and those firms which, rather than close down and throw more men out of employment, have been recently accepting orders at or below cost of production. These are the very firms which on general grounds it would be most desirable to help.

It is considered that further thought should be devoted to more limited schemes, each specially adapted to the circumstances of a particular trade, or even a section of a trade, and followed, where practicable, by actual experiments. Any schemes should be designed so as to be of a merely temporary character.

With reference to partial schemes specially adapted to particular trades, these can obviously only be worked out in a concrete and detailed form by each trade for itself. The Federation draws attention to two classes which it considers merit careful consideration. One of these includes trades mainly concerned with large specific contracts, such as shipbuilding and important sections of the steel and engineering industries, which under the present abnormal circumstances of international trade are exposed to exceptional competition from foreign firms. "There is substantial ground for the belief that the occasional quotation of exceptionally low prices, which are well below the general cost of production even in their own country, is being adopted as a deliberate policy by certain foreign firms and groups; and some ground for believing that this policy is being supported by direct or indirect assistance from their Governments or from local authorities. The object seems to be partly to obtain a favourable position for the particular industry and country concerned in respect of future orders, partly to embarrass and injure the more efficient of the British firms which may be competing in the hope that they may be seriously crippled when more normal trading conditions return. Apart from more immediate effects, the loss of contracts of this class is often particularly injurious to future trade, since the firm which secures the original contract is frequently placed in a position to secure a valuable series of repetition orders for repairs, replacements, and extensions."

The Federation therefore suggests careful investigation by the Government and the trades chiefly concerned, as to the possibility of arranging a system by which direct Treasury grants might be made available from time to time for the retention in this country of important orders of this class.

If suitable organisation could be devised for full and rapid consideration of all the circumstances, the grant of occasional subsidies in this manner might prove not only of substantial immediate value in providing employment, but of even greater value in preserving the efficiency and future competitive power of the trades concerned.

Report by the F.B.I. Economic Staff.

THE Grand Council of the Federation of British Industries, at its meeting on July 8th, considered an important report from the Economic Staff on some of the factors which have produced the present trade position. It was decided to appoint a strong committee to consider this report, and to consult with other interests with regard to the questions raised.

Pending this investigation and the publication of the full report, the Council has published the following summary in the hope of eliciting comment and criticism which may throw further light on the grave and complex problems involved:—

The present trade position in the country gives every appearance of becoming permanent. British trade, after improving for some years, has been checked, and during the past few months has been actually going back, and is doing so at a time when the general conditions of the world are favourable to improvement. If the conclusions to be drawn from analysis of pre- and post-war conditions are correct, it is obvious that just as the most favourable general conditions of trade will not make a nation prosperous if it is inferior to its competitors in efficiency and economy of production, so, without such favourable conditions, the highest conceivable efficiency cannot bring active trade and full employment.

Briefly summarised, the prosperity of British industry before the war primarily depended—(1) On a continuously expanding foreign trade rendered possible by the continuous investment on a large scale of British capital for the purpose of developing hitherto undeveloped countries. (2) On reasonably stable political conditions, at least in the principal trading countries. (3) On a plentiful supply of money involving a general tendency for prices to rise throughout the world.

In addition to this, however, the presence of these conditions throughout the decade preceding the war exercised a profound influence on the development and balance of British industry, as they constituted a steady stimulus to the development of export trade, as opposed to home trade. In 1914 capital and labour had moved continuously for many years into the great exporting industries, rather than into the industries which worked for the home market, and even in those industries which worked for both markets the tendency had been for a steady development in the relative importance of the export branch to the "home" branch. The war demand still further developed many of the industries, such as iron and steel, shipbuilding, and many branches of engineering, which already relied on a substantial proportion of export demand to obtain full employment, so that the end of the war found us with industries specially adapted for an active foreign trade and only capable of giving full employment when conditions were favourable for such trade. But in the whole post-war period from 1920 onwards, these conditions have not been present; in fact, precisely opposite economic forces have been at work. There have been many factors largely outside our control, such as unstable exchanges, lack of balance in the world's markets, a great increase in the restrictions and obstacles which impede the flow of international trade, and political instability in many countries. These factors may, however, be considered as temporary in the sense that they may be expected to pass away and, indeed, are already doing so with the return of stable conditions.

There have been other influences, however, operating on the whole trend of our trade, which to a considerable extent have been the result of conscious and deliberate control. The following are among the most important of these influences:—(1) The influence of heavy taxation, depleting the fund of savings available for industrial and foreign investment, and diverting such savings as are available to gilt-edged rather than industrial securities. (2) The influence of the greatly increased expenditure on social services housing, unemployment relief, education, pensions, &c., which has directly stimulated home trade, at the same time checking export trade by increasing costs through the increase in local taxation and direct contributions, and reducing the funds available for foreign and industrial investment. (3) The influence of post-war monetary policy, which by increasing the exchange value of the £ sterling has forced up the price of British goods relatively to world prices and thus stimulated home and import trade and checked export trade. (4) A great and progressive reduction in the amount of investment abroad. The steps necessary during the past nine months to prepare for and achieve the final return to a gold standard have greatly intensified the effects summarised under (3) and (4) above, and the necessary restrictions on the supply of money are, temporarily, at least, affecting home trade as well as foreign trade, with the natural consequence of a further rise in unemployment.

We have therefore the following position: Industry organised and developed for a large and active export trade and incapable of giving full employment unless it obtains it; but the economic forces which in pre-war days stimulated such a trade removed, and in their place forces which directly oppose it. The action of these forces serves to explain the reduction as compared with pre-war in our exports, both absolutely, and relatively to our imports; the increase as compared with pre-war in our home consumption of coal; the fact that despite the reduction of our export trade to 75 per cent. of the pre-war amount, there were in 1923 approximately as many persons in employment as before the war; the alteration in the relative position of sheltered and unsheltered industries; the relative prosperity, both of retail traders and of industries serving the home market only, as compared with industries mainly dependent on export; and the incidence of unemployment as between different trades and occupations. The p lem to be solved is whether it is possible to reverse t tendencies and to restore the conditions which as far as previous experience can guide us are the only condition which British industry, as at present organised, can pros or whether we must accept post-war conditions as perma and attempt to re-organise and re-adapt industry to meet new position. Will political and general considerations mit the Government to make a reduction, not of a few lions, but of 15 to 20 per cent. in national expenditure taxation? Can local authorities reduce the rates by the s percentage? Is it possible without imperilling the stab of our newly regained gold standard (*a*) to provide money for trade, (*b*) to allow foreign investment to be sumed? Is it possible, pending the resumption of for investment on a scale comparable with pre-war, which obviously be a question of time, to employ such funds as available for lending abroad primarily in the direction w will create the most immediate and effective demand British goods? If these questions cannot be answered in affirmative, it is obvious that the balance as between ex and import trade has been permanently altered, and, whil may reasonably hope for a substantial export trade, suffi probably to pay for essential imports, we cannot expect give us active trade and full employment as in the imme pre-war period. If this is the case, ought we to wait, a are doing at present, until the forces which post-war c tions and our own post-war policy have set in motion brought about a re-adjustment of industry through the s pressure of economic necessity, with all that this impli unemployment and suffering, or should steps be take stimulate home development? Can the export trades helped to divert a portion of their output to new h markets and to adapt some proportion of their produ capacity to new purposes? Can means be devised to a them to pass with the minimum of dislocation through difficult transition period?

These are some of the questions which must be answ and it is obvious that a purely industrial organisation, as the Federation, cannot solve them by itself.

The Commercial Outlook for Radio.*

THE world wants the radio and it will have it, just adopted the talking machine and the automobile. The ind is too new yet to be classed among the stable comm operations of the period, but it is estimated that not less 450 million dollars of total sales will be made in the U States this year, an increase of 100 million dollars or n contrasted with 1924. This of course refers to domestic ness. Exports of radio instruments and accessories are al looming large. In 1924 radio exports exceeded six m dollars in value, with a total of nearly three million d for the first four months of 1925. At this rate radio ex will double in 1925. Practically no limit can be set o expansion of radio exports. Regarded in the beginning mere toy, or a dispensable luxury or amusement, the ra destined to live and grow into a stable business. Its parative cheapness is in its favour. Over and above thi new world that it opens is a stronger argument.

As in the case of nearly all other new and like invent the speculative possibilities of the business have been s upon with unhappy results to many credulous people. panies without number have been formed and exploited, attendant losses to those who invested in them. Recen culations showed a decline in the value of listed or un American radio shares of not less than fifty million do Sooner or later the business will settle down to a commercial basis, with one or two large companies le the field. Organisations ill financed and poorly managed pass out of existence.

Perhaps it is too much to hope for a standardised radio put within the next few years. The time is coming, n theless, when this will happen. As to any estimate "saturation" limit, it is idle to make predictions. A pilation prepared recently by the Standard Statistics Se shows that while there are more than fifteen million pa ger automobiles and nine million talking machines in u the United States at present, there are only about 3,5 valve radio sets in operation. The Service mentione authority in the industry as predicting that there will b million sets in operation in 1930. This does not seem an unreasonable calculation. If the United States touches that record the export trade will grow in propo It must not be assumed, however, that the United State have any monopoly in furnishing the world with radio i ments or accessories. Foreign competition will be keen.

Whether America will produce a Henry Ford in the industry is doubtful. Whether Europe will develop o even more doubtful. Competition will be fought out o plain level of manufacturing costs without much in the of patent monopoly to give advantage to any single prod

* From the *Journal* (June) of the British Empire Cha of Commerce in the U.S.A.

Exports and Imports of Electrical Goods and Machinery in June, 1925.

THE Board of Trade returns for the past month show that our exports of electrical machinery and apparatus reached only 75 per cent. of the April value. The reason for this can again be traced to the item "Submarine telegraph and telephone cable," which is subject to extremely violent fluctuations. In April it made an upward jump of £280,000, and in May it went up a further £83,000; last month the figure experienced a sudden fall to about £16,000. Unfortunately this item is not wholly culpable for the fall of £423,000 in the total, as compared with that of the preceding month. Unenumerated electrical machinery exports also showed a considerable decline (£62,000), as did also the other items under the heading "Electrical machinery," amounting in all to £112,000. Another large decrease is shown under the heading "Telegraph and telephone wires and cables (not submarine)." The falls are partly offset by a number of increases, none of which, however, with the exception of "Insulated wires and cables," is of large proportions.

The position for the first half of the year is a substantial improvement over the first six months of 1924, as will be seen from the following summary of exports:—

Exports.	1924.	1925.
Electrical goods and apparatus ...	£4,759,956	£6,142,309
Electrical machinery	2,495 636	3,031,059
Totals for six months ...	£7,255,592	£9,173,368

The increase, as is shown in the table, is £1,917,776.

As regards imports, these remained approximately at the May level, the decrease being of the order of 1 per cent. A very large increase in the value of imported insulated wires and cables was counterbalanced by falls in respect of unenumerated electrical machinery, meters and instruments, telegraph and telephone instruments, and unenumerated electrical goods and apparatus. The June total was considerably higher than the figure for the equivalent month of last year, and the six-months' total shows a rise of £667,000, as appears from the following figures:—

Imports	1924.	1925.
Electrical goods and apparatus ...	£1,373,879	£2,032,105
Electrical machinery	532,695	541,437
Totals for six months ...	£1,906,574	£2,573,542

The value of goods re-exported during June was about half that of the previous month's re-exports, due mainly to the large decreases in the cases of unenumerated electrical goods and apparatus, and meters and instruments. The total for the six months is, however, greater than that for the first half of 1924.

Leaving the values of goods, it is of interest to note that during the first six months of this year the number of incandescent electric lamps exported was 3,109,620, as against 2,385,534 in the first half of 1924. The total weight of electrical machinery exports for the same period was 17,271 tons, as compared with 15,210 tons.

French Electrical Trade.

Imports and Exports by Countries.

THE French Government has now published a detailed statement of the foreign trade of France, by countries, for 1923. From this the following figures relating to imports and exports of electrical and allied material have been extracted. Comparative figures for 1922 are given and a note is added of increases or decreases.

Exports.

	Metric quintals.		
	1922.	1923.	Inc. or dec.
Dynamo-electric machinery—			
Total	23,050	28,330	+ 5,280
To Belgium	4,910	7.240	+ 2,330
,, Switzerland	300	850	+ 550
,, Spain	3,460	4,270	+ 810
,, Argentina	2,380	1,340	— 1,040
,, Algeria	1,600	2,570	+ 970
,, Tunis	900	1,450	+ 550
,, Morocco	480	2,420	+ 1,940
,, Indo-China	1,100	1,250	+ 150

	Metric quintals.		
	1922.	1923.	Inc. or dec.
Electrical and electro-technical apparatus—			
Total	21,110	27,110	+ 6,000
To Great Britain	1,300	1,800	+ 500
,, Belgium	7,000	7,500	+ 500

Total	13,900	10,365	− 3,535
From Great Britain	2,860	1,200	− 1,660
,, Belgium	3,460	2,630	− 830
,, Switzerland	4,730	5,660	+ 930
Dynamo-electric machinery, 1,000 kg. and over—			
Total	35,000	30,200	− 4,800
From Germany	14,000	1,000	−13,000
,, Switzerland	8,000	5,200	− 2,800
,, United States	9,000	16,000	+ 7,000
Dynamo-electric machinery, 50-1,000 kg.—			
Total	7,200	6,700	− 500
From Switzerland	2,000	2,500	+ 500
,, Belgium	700	800	+ 100
,, United States	640	650	+ 10

	Metric quintals. 1922.	1923.	Inc. or de
Dynamo-electric machinery, less than 50 kg.—			
Total	4,000	4,150	+ 150
From United States	2,500	2,250	− 250
,, Italy	530	760	+ 230
Electrical and electro-technical apparatus, with insulated windings—			
Total	7,000	10,000	+ 3,000
From Great Britain	1,200	1,400	+ 200
,, Germany	1,800	1,000	− 800
,, Switzerland	1,800	1,900	+ 100
,, United States	1,600	4,500	+ 2,900
Ditto, without insulated windings—			
Total	5,700	5,300	− 400
From Great Britain	1,000	1,300	+ 300
,, Switzerland	1,000	1,300	+ 300
,, United States	1,700	1,350	− 350
Dynamo and motor frames—			
Total	140	1,530	+ 1,390
From Great Britain	—	880	+ 880
,, Belgium	—	630	+ 630
Insulated wires and cables—			
Total	1,150	3,900	+ 2,750
From Great Britain	140	1,600	+ 1,460
,, Switzerland	120	1,250	+ 1,130
,, United States	—	500	+ 500
Armatures and parts for electrical apparatus—			
Total	4,250	8,080	+ 3,830
From Great Britain	600	2,650	+ 2,050
,, Switzerland	1,050	1,180	+ 130
,, United States	600	1,270	+ 670
Metal-filament lamps, mounted—			
Total	3,130	3,580	+ 450
From Holland	2,700	3,150	+ 450
Ditto, unmounted—			
Total	37	48	+ 1

The South-East Lancashire Electricity Board.

Annual Report of the Engineering Advisory and Finance Committees.

AT a special joint meeting of the above-named Committees (Alderman W. T. Dagnall in the chair), held recently, the report of the Board's proceedings during the year ended March 31st, 1925, was approved for submission to the Electricity Commissioners. The Board met first on April 1st, 1924. During the year it approved of the following bulk supply contracts: Manchester-Salford, Manchester-Middleton, and Lancashire E.P. Co.-Horwich, the last-named being the purchaser in each case; originally the Board decided that the supply to the Horwich U.D.C. should be furnished by the Bolton Corporation, but the largest consumer in the Horwich area (*i.e.*, the L.M. & S. Railway) elected to take its supply from the L.E.P. Co. (which has power to continue furnishing detail power supplies notwithstanding the granting of a special order to the Horwich U.D.C.), and the Board therefore approved of the change of the source of the bulk supply, the Bolton Corporation fully concurring.

The following plant and mains extensions received approval: Bury Corporation, one 1,000-kW rotary converter and switchgear; Buxton Corporation, one 400-b.h.p. heavy-oil engine and 255-kW dynamo; Lancashire E.P. Co. (Radcliffe station), two 6,000-kW turbines and four 30,000-lb. B. & W. boilers; Stockport Corporation, two 10,000-kW turbo-alternators (to be installed in two sections); and Manchester Corporation, six 33,000-V cables (two of them to be laid only if financial assistance is granted by the Government).

The Oldham Corporation submitted proposals for the erection of a new station at Chadderton, being a station scheduled to the technical scheme. The first instalment would consist of three 12,500-kW, 6,600-volt, three-phase, 50-period turbo-alternators, with electrically-driven auxiliaries. The Board recommended the Commissioners to sanction the erection of the station; it supported the applications of six constituent authorities for special orders and recommended the Commissioners to grant several in circumstances which clearly went beyond the true intention of the fringe order procedure as originally contemplated, *i.e.*, to deal with premises of specific owners. The fringe order procedure is usefully employed in developing areas which do not warrant the taking out of special orders and the Board considers that geographical area rather than ownership of premises ought to be the basis upon which fringe orders are granted so as to encourage cheap and expeditious development pending the time becoming ripe for the taking out of special orders.

There is no obligation upon a constituent authority to acquaint the Board with its intentions in relation to Parliamentary Bills. The Board, therefore, adopted a resolution requesting all constituent authorities to submit details of any Parliamentary proposals to it in the first instance, and at request of the Board the Commissioners have indicated th willingness to consult it on such matters.

Regarding interruptions of supply, upon the representat of a constituent authority the Board has given serious c sideration to troubles which have arisen through the ope tions of Post Office contractors. A scheme for giving not which would secure to a great extent that interruptions sho not take place in the future has been drafted and the Cc missioners have been asked to endeavour to bring the sche into being.

The Leigh Corporation has entered into a temporary agr ment to take a bulk supply from the L.E.P. Co. for six mon from January 1st, 1925, pending the final determination of permanent source of supply by the Board; the matter is *sub judice*.

The Commissioners referred to the Board a proposal by company to erect a private generating station at Chinl about 3¾ miles from Buxton generating station and 5¾ m from Hazel Grove and Bramhall (an electrically develo area). The character of the intervening areas is such t there is no possibility of the Board's indicating an alternat supply, and it therefore informed the Commissioners that had no observation to make thereon. The Board is un obligation to submit proposals before May 28th, 1925 (or su extended time as may be sanctioned by the Commissione for the supply of electricity in areas in which there is a reas able prospect of the supply being remunerative. Activities this connection have already resulted in applications for seve special orders, and several others are under consideration.

The coal consumption in the district has improved follows:—

Year 1919-20	3.112 lb.	per kWh generated.
Year 1923-24	2.190 lb.	,, ,,
A quarter in 1924 ...	2.05 lb.	,, ,,

The cost of administration for the year ended March 3 1925, amounted to £1,991, which when distributed over kWh sold during the year ended December 31st, 1923, *i* 551,251,843, yields a figure of 0.00086d. per kWh, as compa with 0.00119d.* for last year. The district contains a po lation of 2,833,782, the areas which are at present the subj of distribution orders include a population of 2,670,158, be 94.2 per cent. of the whole. The energy sold amounted d ing the past year to 632,369,490 kWh, being equal to 223 k per head of population, as compared with 100 kWh per head Great Britain.

* A 12 months' figure calculated from the ascertained 6 months' figure of 0.00099d.

Factories and Workshops.

H.M. Chief Inspector's Annual Report.

THE annual report of the (Home Office) Chief Inspector of Factories and Workshops for the year 1924* shows that the number of registered factories in Great Britain has again increased; the total now stands at 142,494, as against 139,920 for 1923, but the number of workshops continues to decline, and is now 33,729, as opposed to 140,850 last year. Factories thus for the first time exceed workshops in number and, as has been pointed out before, the decline is largely due to the introduction of electrical power, the use of which converts premises from a workshop into a factory. There is, too, the tendency for the small places to be absorbed by the larger ones.

Accidents.

During the year under review 169,723 accidents were reported, an increase of 44,172 over the previous year. The main reason for the increase is stated to be trade improvement in those industries which experience has shown are the chief accident producers. No fewer than 656 fatal accidents were reported last year, an increase of 89 on the total for 1923, the increase having again taken place in particular groups of industry in which fatal accidents are always most numerous, and deaths due to transmission machinery reach the formidable total of 58, an advance of 9 on the figures for 1923; an unusually large percentage of this particular type of accident is of the most serious character, and we know from experience that of all transmission machinery the unprotected rotating shaft claims the most victims. About 85 per cent. of the prime mover accidents were caused by back-fires in internal combustion engines, and the majority of accidents due to starting engines could have been prevented by the use of compressed-air or electrical starting devices. Cranes have been responsible for a total of 3,093 accidents, no fewer than 76 of them being fatalities. The crane as an accident producer is apt to be under-estimated, but as a matter of fact, after falls of persons from heights, and of articles on persons, the crane comes next as a source of fatal accidents and stands far in front of any single type of machine known at present to industry; however, cranes are in use in an immense variety of industries, and predominate where heavy material has to be handled.

Four explosions in dry-cleaning works were notified; one was doubtless, and the others probably, due to the ignition of benzine vapour by sparks caused by electrostatic charges. Under the heading of "Dangerous Trades," the special danger which arises in such operations as the covering of heels for shoes, or the making up of some kinds of advertising goods, by the use of celluloid that is softened in a tray of spirit before application, is pointed out. A fire occurred in one factory, probably owing to one of the workers attempting to remove an electric lamp bulb with a rag (soaked with acetone or other spirit) which caught fire; fortunately it was quickly put out, but the incident emphasises the need for double glass gas-tight electrical fittings where such processes are carried on.

Accumulator Trade.

New Regulations for the Manufacture of Electric Accumulators were issued on March 1st, 1925; the new code, like the old one, deals with the risk of lead poisoning. The old code was confined to manufacture, but, as a like risk is associated with certain processes in the repair of accumulators, the new regulations cover repair work. A recent development in manufacturing processes is the use of a new kind of paste material which avoids the employment of oxide of lead. It is said to be very satisfactory, and its use appears to be extending, but risk of lead poisoning is not eliminated by its introduction. Future experience alone will show to what extent the use of this material will prove less dangerous than oxide. As a result of the wider definition of "lead process," the new rules go beyond the corresponding regulations of the old code; moreover, they set up higher standards.

During the past year many improvements were introduced by manufacturers either to secure compliance with the old regulations or in anticipation of the requirements of the new code. A number of departments were remodelled, and new exhaust plant installed. The rush of orders in many cases has, however, militated against anything in the way of finality being achieved, especially in those cases where the capacity of the works is being fully tested by the present volume of production. It may well be that the present incidence of lead poisoning in the trade is largely the outcome of these circumstances. During 1924 cases of lead poisoning in the accumulator trade totalled 101 (no fatalities), as against 95 (2 fatalities) in 1923. This industry, owing to the increasing use of electric accumulators for motor-cars and wireless sets, is a notable exception to the prevalent trade depression, and has been characterised by a corresponding increase in the number of cases of lead poisoning; 60.4 per cent. of the cases were slight, with absence of symptoms of paralysis, but this is only to be expected with the short time of exposure of the workers to the baleful influence of lead dust. Undermining of the health must be slowly taking place and, as poisoning is due to dust, it is clearly amenable to exhaust ventilation meticulously applied as near as possible to the point where the dust is generated. Regulations based on this principle were drawn up by Dr. Bridge and Mr. Price, in conference with a subcommittee of employers and employed, and are now in force.

Lighting.

Lighting is exciting greater interest, but perhaps the most striking feature is the wide inequality in the standard of lighting, not only in different works, but in different parts of the same works. Such inequality is strong evidence of lack of scientific knowledge, and demonstrates the need for putting forward some standard for the guidance of employers and workers, and for obtaining information as to satisfactory practice which can be made known to the persons concerned.

With such objects in view, representatives of the Home Office have, during the past two years, met representatives of both employers and workers in a large number of industries, and have explained the general principles governing good lighting on the lines of the Departmental Committee's reports, and have discussed in detail the requirements of the particular industry. These meetings have proved very useful, and both employers and workers have shown great interest in the subject. In factories where attention has been given to supplying a good light for fine or very fine processes, tests showed the amount of illumination in every case to be over three foot candles, and in many cases above five foot candles. In one process where a good light is recognised as important, the factory had been newly equipped with an installation affording an illumination of from 13 to 23 foot candles for each worker, while in the same factory for the same process the light previous to the new installation was less than one foot candle. Both employers and workers were delighted with the improved lighting and found it entirely satisfactory.

Provided that the eyes are protected from glare, the workers appreciate a high degree of light, and, so far as the inspectors are aware, no injury is caused to the eyes by artificial illumination of from 20 to 30 foot candles if the light is properly shaded and diffused, but the inspectors who conducted the tests lay emphasis upon the need for much greater care in this respect than is commonly exercised. A big problem is that of glare, and in many instances where new lamps have been fitted in old shades the results have been very unsatisfactory. The least satisfactory tests have been those obtained in the spinning and weaving departments of textile factories (other than hosiery). The amount of light provided is, on the whole, low, and there is need for more attention to its equal distribution over the plane of work on the loom or the spinning frame and to the placing of the lights so as to avoid glare on the one hand, and troublesome shadows on the other. Generally, the low readings are not usually due to economy in the use of gas or electricity, but to neglect of upkeep of fittings—globes and shades being dirty or in need of renewal—or to bad placing of lights in relation to the position of the worker or of the machine.

Trade Conditions.

Taking industry as a whole, trade conditions have again been bad, and one of the tragedies of the situation is that so many young people have no opportunity of learning a trade, and there is real danger that in some of the staple industries, when the revival in trade at last arrives, there will be found a shortage of skilled labour. It has been suggested in some quarters that older workers, more especially in the case of women, were being replaced by young labour, but the inspectors have not in fact obtained any evidence of this.

Some branches of engineering have been very busy, more particularly those connected with electrical developments, wireless apparatus, motor transport, and railway plant. Perhaps the most noteworthy development is the continued and rapid increase in the generation and use of electricity, which is referred to by the senior electrical inspector.* Important developments, too, have been taking place in the chemical industry; a new plant, the only one of its kind in this country, has been erected in one area for the manufacture of sulphuric acid by the Schmiedal process, which is capable of turning out 1,000 tons of concentrated acid a month, and in the same area a plant has been completed for the manufacture of synthetic ammonia. What is said to be the largest alcohol factory in Europe has been started up in the Hull district, and in Grangemouth the large new oil refinery is now working to full capacity. An entirely new process, the manufacture of endurite, has been started in connection with a paper mill in the Edinburgh district, and this promises to develop greatly. This is to use up all the waste products from the esparto grass, the coarse fibre of which is unsuitable for paper making. At present many of the mills pay large sums annually for the removal of this waste, which will now be collected, ground, and pressed in steam and hydraulic presses. The resulting material can be stained to any colour, and may be used in the manufacture of combs, buttons, toothbrushes, &c., just like the casein products. Its principal use, however, will be in electrical work, as it possesses extremely high electrical resistance. There have also been developments in machinery, and a good deal is said in this year's divisional reports concerning labour-saving appliances.

The British Silk Research Association is collaborating with the British Electrical and Allied Industries Research Association in research on the electrical insulating properties of silk, and on the improvement of the method of preparing silk destined for electrical purposes.

New Electrical Devices, Fittings and Plant.

(Readers are invited to submit particulars of new or improved devices and apparatus.)

Combined Electric Fire and Electro-Vapour Radiator.

The accompanying illustration, fig. 1, is of a novel design of electric fire and electrically heated water radiator combination marketed by MESSRS. BENHAM & SONS, LTD., 64, Wigmore Street, W.1. The control of the fire is entirely separate from that of the immersion heater, under the radiator, for the heating of the water.

The combined convected and radiant heat has many advantages in the office and home. The large heating surface of

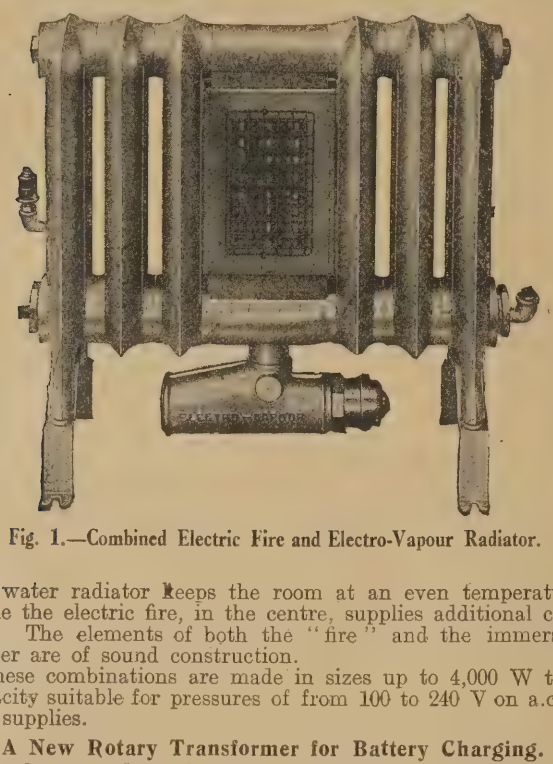

Fig. 1.—Combined Electric Fire and Electro-Vapour Radiator.

the water radiator keeps the room at an even temperature, while the electric fire, in the centre, supplies additional comfort. The elements of both the "fire" and the immersion heater are of sound construction.

These combinations are made in sizes up to 4,000 W total capacity suitable for pressures of from 100 to 240 V on a.c. or d.c. supplies.

A New Rotary Transformer for Battery Charging.

The latest product of MESSRS. NEWTONS, of Taunton, which is being marketed by MESSRS. ROTAX (MOTOR ACCESSORIES), LTD., Rotax Works, Willesden Junction, London, N.W.10, is a new rotary transformer for battery charging, illustrated herewith, fig. 2. This model consists essentially of two armatures mounted on a single shaft of ample dimensions to prevent flexure, a point of importance in the design of double armature machines having two bearings only. Separate field magnets are provided for the motor and the generator, permitting pressure regulation from full to zero. Special regulation coils are fitted to ensure constant pressure over long periods. These coils are in series with the motor armature and are wound so as to assist the shunt windings. The temperature

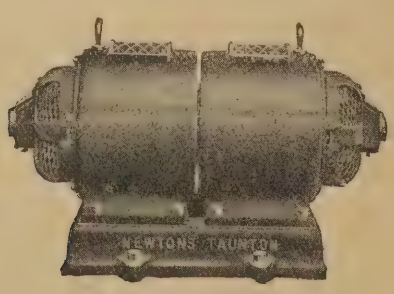

Fig. 2.—A Battery Charging Transformer.

rise is claimed to be very moderate. Messrs. Newtons also make a model, designed to meet the case where two different pressures are required simultaneously, which carries a second and smaller generator excited in a similar manner. Three bearings are fitted to this machine.

Powdered "Insalute" (Liquid Porcelain).

According to *The Electrical News, Toronto*, the TECHNICAL PRODUCTS Co. has developed a new adhesive fireproof and acid proof insulating cement which is being marketed under the name of "Powdered Insalute." It is also being used for assembling metal to wood, asbestos, mica, porcelain, glass, &c., because it is not necessary to melt it to make it stick. It does not become conductive until heated above 1,000 deg. F. (the best porcelain becomes conductive at about 1,500 deg F.). If insulation is required at higher temperatures, insalute may be mixed with other refractory materials. It is stated that insalute may be used as a binder for making furnace cements, cementing asbestos tubes, assembling materials of var natures, and for use as a paint where organic materials not withstand heat.

An Armour Plate Coal Crusher.

Power gives an illustrated description of a new coal cru recently put on the market by the PENNSYLVANIA CRUSHER Philadelphia. This crusher is built in sizes from 1 diameter roll and 24 in. wide to 30 in. diameter roll and 7 wide, giving capacities of from 30 to 500 tons per hour. the exception of the breaker plate and roll segments, crusher is made entirely of steel, 30-in. H girders being for the side frame construction. Cross members of he channel and angle plates are hot-riveted to the girder-b side frames. Steel bearing housings, shouldered into the frames to take the shear, and hot-riveted in position, are fi with interchangeable die-cast bearing bushings. Lubrica is effected by large grease cups in the frames over the beari The crushing roll is of special segmental construction, ha no bolts through the crushing surface. The segments are l in place by tapered steel dowels and one through bolt. breaker plate tip, which takes the major portion of the w in the crusher, is of manganese steel, and is renewable. plate is readily adjustable for varying the fineness of crush

A Switch and Transformer Combination.

This is the latest production of MESSRS. W. FRANCIS & LTD. Manor Road, Altrincham, Cheshire, which will appea engineers who are faced with the difficulties of installing plant in restricted spaces.

The transformer core and windings are housed in the sw pedestal which forms a substantial flame proof, oil-immer transformer tank. Fig. 3 is a general view of the device w the tank removed.

The switch is of the draw out type—oil-immersed—and interlocked that it is impossible to withdraw the switch w

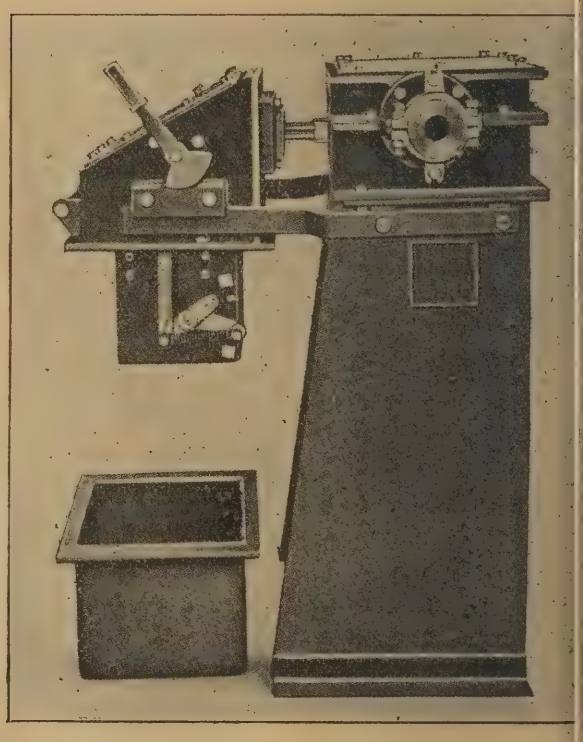

Fig. 3.—A Combination Switch and Transformer.

out first switching "off" and, though when withdrawn switch can be operated "dead" for adjustment and inspecti it cannot be plugged in again unless it is in the "off" positi thus ensuring that the circuit cannot be closed with the enga ment only of the plugs. The switch tank is also interloc in order that the tank cannot be removed until the switch been withdrawn, nor can the switch be re-plugged in until tank is replaced.

The plug and terminal chamber is arranged for tak the h.p. cables straight through, without cutting, thus ens ing the continuity of the main cable system. The plug soc and the split terminal for the cable connections are mou into an insulated base and plugs and sockets for disconnect the main cable and the h.p. side of the transformer provided.

The complete unit is rated for 3,300 volts; it is of str and compact construction both electrically and mechanica and, it is claimed, will render reliable service under the m trying conditions incidental to mining.

Electricity Supply in Ulster.

A Northern Ireland National Scheme.

COMPREHENSIVE scheme of electricity development for er was outlined by Mr. Johnstone Wright, M.I.E.E., Mech.E., city electrical engineer, Belfast, to the Com- ion on the Natural and Industrial Resources of Northern nd, which held its thirty-third session in the Municipal ge of Technology, Belfast, on July 9th, under the presi- y of Viscount Charlemont.

r. Wright is reported by the *Belfast News-letter* to have ted out, *inter alia*, that a comprehensive scheme was of the test importance, but the difficulties of attaining that de- le end were not so much technical as financial and ad- istrative. Uttering a warning against expecting too much, aid there were certain defined limits below which the price lectricity from a public supply network could not fall, but in a reasonable radius and under normal conditions supply ld be cheaper than from small isolated plant. Heavy tal charges were the bane of the electricity supply industry. r effect could be mitigated in no other way than by im- ing load factor, and thus a scheme for any district must ased on the load factor which the industry of that district ld give. The same remarks could be made to apply to a er power scheme, for it was quite possible to have a water er scheme (which was a true coal conservation scheme) such a heavy capital cost that it could not produce a per supply than a coal-fired station. Any country that ched a comprehensive national electricity supply scheme ht be doing a very good thing for the future, but unless Government of the country was prepared to finance the ertaking for a number of years the scheme would operate he advantage of future consumers at the expense of the ent ones. There was no doubt about the benefits of an ndant electricity supply in any country, but he believed a supply should be developed gradually on economic lines an eye to the future and with some form of Government stance for schemes on which there would not be an imme- e return due to providing for future development, but e likely to be economic, say, within ten years. The tion in Ulster was somewhat different from that he defined electricity districts in England and Scotland. re were only two public electricity authorities of any size resent—Belfast, with a normal rated plant capacity of, say, 00 kW, and Londonderry, with a plant capacity of 6,500 . For the year ended March 31st, 1925, Belfast generated 09,610 kWh and Londonderry 539,716 kWh. The distance veen the two stations was, roughly, 62 miles and no possible ntage in load factor or otherwise could accrue from linking hose two stations at the present time. In fact, it was im- ible from an economic point of view. Witness said that at outset, financial assistance would be required to develop rge scheme, though he thought that in the course of time e would be a possibility of repayment. Small stations in n areas were wasteful and expensive, and could not be rporated in a large network.

y means of a large scale map witness explained details of heme for Ulster. The first thing which struck one were facilities for electrification of the whole district by means ailway electrification. Unfortunately, he was afraid that not practical politics in the meantime; and, if possible, a me must be considered which, while not overlooking rail- electrification, was not based on it.

Sources of Supply.

he two existing sources of supply were Belfast and London- y, and two outstanding possible sources, Coalisland and River Bann (Carnroe), in future years might take part in mprehensive scheme when that stage of development was hed. The sites could not be better placed from a distri- ing point of view. The greater part of the power load was red around Coalisland and Belfast. Londonderry, although as well placed as Belfast from an efficient generation point iew, was at present far removed from the load centres, for that reason alone he thought it must be left out of any nary discussion. Prospects of generation at Coalisland ned to be the most promising, for there coal was within reach of an ample water supply for condensing purposes. would not recommend building the station at the colliery he use of cooling towers at the colliery would involve a loss efficiency far exceeding the cost of coal transport to the k of Lough Neagh. If the colliery developed, would it not better to extract the household grade of coal from the ton- e brought to the Lough bank and transport this part of output alone by rail, convert the remainder into electricity, distribute by this means throughout Northern Ireland? cheme of this kind had considerable possibilities, and with verised fuel equipment there was no difficulty in operating efficiently with all grades of coal, and the advantages of distributing electricity instead of transporting steam-raising coal were obvious. The promoters of the Northern Ireland Electricity Supply Bill might have done better, if they had considered a co-operative scheme.

Cost of Power Stations.

At the Belfast station, for instance, there was ample spare plant during the summer months to supply any Bann scheme network during drought periods, and the Belfast Corporation would be only too glad to assist in any scheme which would not involve increased capital, but make better use of the existing capital. It was more than possible that a working agreement between a Bann scheme and a coal-fired station might result in a lower capital cost on a Bann scheme and more efficient use of capital at the coal-fired station, resulting in lower charges to the consumers. In order to ascertain the economic possibility of supply at the various load centres he had designed a main transmission network capable of meeting the full requirements of the area, to be supplied from Coalisland, the Bann or Belfast, the ring main pole-line system being adopted as far as possible, transmission being at 33,000 volts. He estimated the cost of this complete transmission system, including pole lines (and cables where necessary) of 10,000 kW capacity, transformers and switchgear at load centres, but exclusive of buildings and distribution networks at load centres, would be £428,000. Assuming an average selling price of 1½d. per kWh, a reasonable price for bulk supply, the revenue from a demand of 6,500 kW on a 25 per cent. load factor, which would mean an output of 14,200,000 kilowatt-hours per annum, would be roughly £89,000 per annum. This would give a return on the capital cost of transmission network of approximately 21 per cent. If to the capital of the network was added the capital, say, at Coalisland, the result would be roughly as follows:—A steam-fired station consisting of two 10,000-kW turbo-alternators (one spare), complete with boilers to steam 10,000 kW (one boiler spare) at £20 per kilowatt of actual steaming capacity, plus £60,000 for spare plant, would cost £260,000. This gave a total capital of £688,000, on which the return with a revenue of £89,000 would be 13 per cent. Interest and sinking fund charges alone would absorb at least 8 per cent. A station utilising the Bann water, while having a greater capital cost, might give a better return due to lower operation costs, but this depended entirely on the capital cost of construction works. Again, the position of the Bann development in relation to the load centres made it very improbable that it could show any advantage, as the capital cost of transmission and the losses would be higher than those from, say, the Coalisland site. If the Bann development and transmission to Ballymoney and Limavady were cut out of the transmission scheme, there would be a saving in capital on transmission lines of about £54,000.

Considerable Financial Risk.

From those rough figures it was fairly obvious that any authority or company undertaking such a comprehensive scheme would be taking very considerable financial risk, unless a substantial subsidy were available for, say, 10 years. The financial results of a complete scheme were disappointing, but one must face economic facts although fully realising the benefit of public electricity supply to any community. If that represented the position in the industrial North of Ireland, as he believed it did, there was room for apprehension in connection with some larger projected schemes in non-industrial areas.

Under the existing prospective load conditions he could see no hope of financial success arising out of a station at Coalisland at the present time, and less prospect from the development of the Bann scheme, but he was far from suggesting that the idea should be given up altogether. The financing of the initial stages was the main stumbling block.

For an expenditure of about £1,000,000 a very complete system could be laid down, embracing the industrial area—a small expenditure when one considered the ultimate gain; but it was a political question as to how far a Government was justified in incurring that total expenditure for future results. The cost of scrapping old methods delayed ultimate development. The most promising field for first stage development was on the Lisburn, Lurgan, Portadown, Armagh, Dungannon line. Lisburn was within comparatively easy reach of Belfast, but even that supply could not be undertaken by the Corporation unless a demand of at least 1,500 kW was assured from the very commencement of supply, and there seemed little prospect of that. The Harbour power station at Belfast was quite capable of being developed at a minimum cost to give bulk supply to meet the whole needs of the area, and for first stage development at least it would be foolish to incur the capital cost of generation when a supply was available.

Concluding his formal evidence, witness said it would pay the country as a whole to bear the initial cost of the scheme in taxes, having in mind the ultimate results. If they electrified the railways, electrification of the whole of Northern Ireland would be simple.

Women in Science, Industry, and Commerce.

An International Conference of Women at Wembley.

ON Wednesday, July 15th, the first International Conference of Women in Science, Industry, and Commerce was opened at the British Empire Exhibition by the president, H.R.H. the Duchess of York, who addressed encouraging remarks to the large gathering of members of the Women's Engineering Society and kindred associations, including the Electrical Association for Women. Lady ASTOR, M.P., was in the chair, and said that the Conference afforded the opportunity to review the work that women had already done in these new fields, and would stimulate them to further efforts.

Lady RHONDDA expressed the view that business men should take their daughters into their businesses—until that was done they would never get many women into the higher ranks of commerce.

Miss ELLEN WILKINSON, M.P., maintained that women should not undercut the wages paid to men, and Miss MARGARET BONDFIELD said that women in industry were given inferior jobs on account of their lack of organisation. Several other ladies spoke, including delegates from overseas.

The Conference was convened by the Women's Engineering Association, in co-operation with the British Federation of University Women, the Industrial Welfare Society, the Institute of Industrial Welfare Workers, the National Union of Scientific Workers, the Standing Joint Committee of Industrial Women's Organisations, and the Electrical Association for Women. The members were entertained to luncheon at the Garden Club by the British Electrical Development Association; the Duke and Duchess of York were present, and Lady Astor presided.

After the loyal toast, Miss V. HOLMES, A.M.I.Mech.E., A.M.I.M.E., proposed "Women in Science, Industry, and Commerce," contrasting the conditions of 20 years ago, when practically no women took part in those pursuits, with those of to-day, when large numbers of women were thus engaged. The difficulties they met with in engineering were greater than in other branches of industry, yet hundreds of women were employed in that calling, and one engineering firm was "manned" entirely by women.

Responding, Miss MARGARET BONDFIELD, J.P., referred to the manual labour performed by women as chain and nail makers 40 years ago, and said that while they now enjoyed equal opportunity, they were underpaid as compared with men of equal skill. A revolution had taken place in processes of production; factories were equipped with machines in which the skill was incorporated, and were operated by "minders." There were still men's processes, but most jobs to-day were suitable for women to work at. Women would gain greater influence in industry; let it be a humanising influence, elevating industry to a higher plane. They asked for a clear road, free from the obstacles of prejudice and tradition, to make industry what it ought to be—the servant of life.

Mr. W. B. WOODHOUSE, president, I.E.E., proposing "Electricity in the Service of Women," said the Electrical Development Association was glad of the opportunity of welcoming that very important conference and assisting in a notable movement. Industrialism had been built up by engineers with the aid of the steam engine, which led to concentration in factories and towns; electricity would enable them to abolish smoke and redistribute the works in pleasanter surroundings, by its use in transport, for power; in the use of electricity in the home, he particularly welcomed the co-operation of woman, the real home designer. Electricity reduced domestic drudgery, but electrical apparatus required maintenance, and there was a big field for women engineers to specialise in the design and upkeep of appliances for home use.

Lady ASTOR responded, thanking the E.D.A. for the entertainment extended to the members, and expressing the hope that women in industry would not be bound by tradition; let them be helpful in the workshop as they were in their homes, and import spiritual qualities into public life.

After the luncheon a conducted tour of the Exhibition was made, a special display of women's work having been arranged for this day by exhibitors.

Vehicle Head Lamps.

On July 16th the morning session was concerned with engineering, chemistry, and research. A contribution on "Automotive Research," by Miss Ethel H. Bailey (of the Research Department of the Society of Automotive Engineers, in America), outlined some of the work being done by that organisation, which was established in 1921. Active work had been started anew on the subject of vehicle headlights, and a special committee had been appointed to investigate the visibility tests on which the present specifications were based, and to make recommendations as to the advisability of further tests. It was not the intention of the Committee to recommend specific devices, but to consider fundamental principles.

Electricity in Mines.

"Electricity Applied to Mining" was the subject of a paper by Miss H. M. DAVIS (of Messrs. Metropolitan-Vickers), which was read on Thursday morning. The author stated that the use of electricity in mines was rapidly increasing, and ceeded to describe in outline its various applications to mi operations, from the coal seam to the railway truck, gi special attention to winding plant. For the sake of thermal efficiency the supply of electricity from "st stations" was generally advocated, but she considered this system was not necessarily the solution of the pro of obtaining cheap power, and in the case of collieries n be distinctly inferior to a scheme involving the sub-div of the generating plant. High thermal efficiency did necessarily result in high commercial efficiency; the col load factor rarely exceeded 50 per cent., and the transpo electricity was much more costly than the transport of Unless energy could be supplied to the collieries at a 0.7d. per kWh, most collieries would be well advise generate power for themselves.

To meet the special conditions met with in colliery p stations, a scheme had recently been introduced know the "S.P." scheme,* the principle of which was the com separation of the winder load from the remainder of the p supply about the colliery. The energy for winding was plied by means of a high-pressure condensing turbine dri through reduction gearing the Ward-Leonard generators the winder, a flywheel being added to equalise the steam mand from the boiler plant. The remainder of the p was generated by high-pressure condensing turbo-gener units. This arrangement appeared to offer an economic tion for the power supply of the larger collieries. An exa on this principle had been installed at a large Yorkshire and was operating satisfactorily. This system claimed economies over either the central power station or the st winder mixed-pressure turbine arrangement of power su largely due to the elimination of transmission losses and p in the first case, and the more efficient utilisation of stea the second.

The elimination in this manner of the intermittent win peaks would have the effect of improving the load facto the central station, but the solution of the problem was only half complete. Taken over the period of one win shift, the load was reasonably constant, but taken ov longer period, such as a day or week, the load still fluctu to an enormous extent. The complete solution of the pro was very much more difficult of achievement, since it w appear to call for the complete re-arrangement of the wor periods. In the author's opinion, while this would b extremely difficult matter, the difficulty was not by any m insuperable, and it appeared that in the course of a few y with the sincere co-operation of all parties concerned, a rearrangement of working shifts could be carried out, re ing in an immense improvement in the load factor, and sequent reduction of the power costs.

Mrs. MATTHEWS (of the Consolidated Pneumatic Tool Ltd.) opened the discussion by saying that many exce examples of the flywheel storage method of meeting the loads of the winding seemed to meet the requiren of a large number of mines. It was a system, more which would probably prove more valuable when the "st power" stations came into use, because it would the necessary to take special precautions to prevent undue ru of current from the main power station during the p of accelerating the load on the winding gear. Progre operators were fast realising the ease and value of appl machines instead of muscles for shot-hole boring. Her pany's new machine was built for use in gaseous or mines, the electric motor being enclosed in a gas-tight case in order to reduce the weight, air cooling was ado through an extra casing surrounding the motor air was b by a fan, and it thus became a portable machine, e handled by the average miner. When introducing applia of this kind, one had to fight harder against the prejudic the man whose labour one was trying to reduce than ag the conservatism of the mineowner.

Miss DAVIS, replying to the discussion, said that the of a.c. and d.c. for winding gear depended upon the gramme at the pit. The Ward-Leonard equipment was, o average, about 1.7 times more expensive in initial cost a.c. equipment, but on a large equipment with a flyw the reduction in the energy consumed at the start of the and the equalisation of the peaks, would warrant the inst tion of the d.c. system. The saving in energy was so that the equipment would pay for itself in a few years.

The final paper of the morning session was by Miss I H. Hadfield, M.Sc., of the National Physical Laboratory, discussed some chemical problems in the cotton indust

Welfare and Factory Inspection.

The afternoon was devoted to questions relating to indus welfare and factory inspection. The first paper was by Constance Smith, who stressed the important part w

* The system was described in the ELECTRICAL REVIEW April 24th, 1925; pp. 674-6.

›men factory inspectors had played in industrial history. .e effect of welfare work on health and efficiency was dis-ssed in a paper by Miss C. U. Kerr (of the Industrial 'elfare Society), who gave many concrete examples of in-›ased efficiency and better health among workers as the ›ult of such work. The author's viewpoint was distinctly ›ctical rather than philanthropic. It was a striking tribute the value of welfare work that, in spite of an unprecedented lustrial depression, its practice and ideals had been every-›re maintained—sometimes cut down considerably—but still intained both in the letter and the spirit.

The possibilities of advancement for women in industry ›s dealt with in a paper by Miss E. E. Wilson (of the ›titute of Industrial Welfare Workers). Economically, the ›tion of women was serious, owing to the unemployment of ›n still remaining an unsolved problem. Tradition was one the most serious factors; the custom of assigning without estion a particular kind of work to a man, without con-›ering whether it could, with or without some modification, better done by a woman, was difficult to break down. Tem-›amentally, women were different; they took more interest the personal side, had greater intuition, but were not so ›ical as men, and were possibly more timid. Some of these ›iculties, however, under control, might probably prove to assets rather than hindrances.

)n July 17th the morning session was devoted to a discussion commerce and salesmanship, and papers were read by Miss Burlton, B.A., and Miss L. F. Nettlefold, LL.B., dealing ›pectively with salesmanship and the place of the wholesaler the scheme of distribution.

Electricity—Domestic Science.

In the afternoon there was a discussion on the production d distribution of electricity, and its uses in the home, ›ilst demonstrations of electrical apparatus were also given. ›erman Mrs. HAMMER, of Hackney, who is ever ready to each the gospel of electricity, especially in its domestic ›plications, presided over an interested audience of ladies, d in her opening remarks spoke convincingly about the inging of electricity into every home.

The first paper was by Miss M. Partridge, B.Sc. (of the ectrical Association for Women), on "Producing and Dis-›uting Electricity." She explained that the wide differences price of electricity in different districts were mainly due to difficult people." There was little room for improvement the efficiency and reliability of generating plant, but load ›tors varied widely according to local habits and customs. ›e cost of distribution for lighting was three times the cost production. In rural districts overhead lines were essential cheap supply, but their cost was greatly increased by the position of local authorities and land owners, and the re-›irements of the Postmaster-General. Unexpected additions the demand in a district might threaten overloading the ›ins, and necessitate restrictions on the supply pending the ›vision of increased carrying capacity. The cost of wiring ›o was a serious obstacle to development, tenants being willing to wire their houses for the benefit of the landlord. was unfortunate that electricity and gas undertakings were ›rly always in fierce competition—if it were not so, more ›ght be done in the way of standardising the practice of oviding light, heat, and power services in houses.

In order to satisfy inquirers about the reasons for different ›sts in different districts, the author made a list of various ›ms that made up the cost of electricity supply to private ›ellings and came to the conclusion that 90 per cent. of the ›st variations might be gathered under one main heading—difficult people." It was unfortunate that electricity and s undertakings were nearly always represented by different ›ancial interests. If it were not so, there was no doubt at more might be done in the way of either making the ›rvice installation a standard and necessary part of the house ›uipment, chargeable to the landlord and recoverable by an ›itable rent return, or else by giving the tenant who paid r the installation the possession of it, so that he would be at ›erty to sell it at a valuation to either landlord or incoming ›nant when he completed his tenancy. Gas companies often ›actically gave away everything except the gas. The author ›ew of one electricity company which gave a present of three ›e lighting points and one free heating point in each house. ›is pleased the tenant, who usually willingly paid for a few ›cessary extra lighting points. Hire-purchase terms also got ›er some of the difficulties, but plumbing was not carried on this patchy way; it was part of the building, as electric ›wer should be.

The final paper was "At Home with Electricity," by Miss J. Dillon, B.Sc. (of the Domestic Science Department of ›ing's College for Women, Lecturer in Physics at the College, ›d Demonstrator at the London School of Medicine for ›omen), who dealt in simple language with the first prin-›ples of electricity and pointed out that a knowledge of first ›inciples was necessary because, although electricity had ›en introduced into many homes, the users would not be ›ppy until they were more at home with it.

Mrs. HOSTER, in opening the debate, said that she had had ›ectricity installed in her own flat at her own expense, but no ›e else in the same building had it because it was too expen-›ve. If it were twice as dear as other means she would use it, ›t not while it was four times as dear.

Miss PARTRIDGE pointed out that there were several districts London where electricity was used in all the working-class houses; it was unfair to generalise and to say that it was expensive for cooking, because it was not.

Alderman Mrs. HAMMER said that it was a paying proposition up to 3d. per unit, and there was no question about its being more healthy.

Mr. L. L. ROBINSON (Borough Electrical Engineer, Hackney), on the question of cost, said that he had over 600 cookers on his mains. Electricity was supplied at 1d. per unit and the cost of gas was about 9d. per therm, and on that basis the general opinion of his consumers was that electricity cost from 75 to 100 per cent. of the cost of cooking by gas. Occasionally there were complaints that electricity cost twice as much as gas, but in every case investigated, the trouble had been found to be due to the faulty use of the cooker by the housewife. Nowhere in England should consumers be paying more than 2d. per unit for heating, and any undertaking charging more than that should be put out of existence. With regard to the difficulty of first cost of an installation, thousands of contractors could not afford to do anything except on cash terms, but if they helped the municipalities to obtain the powers to carry out installations, those municipalities would give contractors the orders to effect the installations and would themselves sell them on easy payment terms.

Mrs. WILSON, M.B.E., said that she had a private installation for the supply of electricity, but when supplied by the municipality in her district electricity was very dear.

Mrs. BALDWIN urged that housewives should be shown how to use electric cookers; some of those present had come for that very reason.

Miss C. GRIFF, A.M.I.A.E., said that electricity was economical when supplied on contract rates. At her home in Warwickshire the price was 30s. per quarter, and 1½d. per unit during the summer and 2½d. during the winter. Ordinarily the unit cost 7d. or 8d. If there were lighting and a power plug in every room, the cost would be less than at the ordinary rate, but supply companies would not tell the consumers that, and until they asked for the contract rate they did not get it. Her bill was about £2 10s. per quarter, and its use for lighting and heating was not stinted. It was not used for cooking, however.

Alderman Mrs. HAMMER compared electric with gas cooking from the point of view of health, and Miss PARTRIDGE, replying to the discussion, said it was not so easy to demonstrate electric cooking in a rural district as in Hackney, while Mr ROBINSON suggested the use of a travelling exhibition on a light Ford car.

Legal.

Miller v. Scintillating Sign Co., Ltd.

IN this debenture holder's action Counsel moved before Mr. Justice Eve in the Chancery Division, on July 17th, for the appointment of a receiver and manager of the defendant company. He said the principal money in plaintiff's debentures was not due nor was the interest in arrear, but five or six actions were pending against the company. The plaintiff held debentures to the amount of £2,030 out of a total of £3,460. The company was an electrical sign advertiser, and had a large number of contracts running. In reply to the Judge, Counsel said that he was told that Mr. Miller was a director of the company.

His LORDSHIP said that that had better be disclosed; it was not sufficient for Mr. Miller to describe himself as a "Government contractor."

Charles Harold & Co., Ltd., v. Andrews.

AT the Birmingham Assizes last week, before Mr. Justice Rowlatt, Messrs. Charles Harold & Co., Ltd., bullion dealers, Birmingham, brought an action against Charles Andrews, engineer and dealer in electrical and automobile accessories, Birmingham, for alleged breach of warranty and for a return of £200 advanced on the sale of "platinum" magneto points. It was stated that the defendant sold to the plaintiff company a number of magneto contact points which both parties thought were platinum points. Alternatively, it was suggested that the defendant had been guilty of fraudulent misrepresentation, because the points were found to be not platinum but tungsten. For the first delivery the defendant was paid with a cheque for £73 10s., which was stopped before payment. The plaintiff paid £200 on account of a second delivery. A first acid test led the plaintiffs' works chemist to believe that a pair of sample points were platinum. Analysis showed that those brought by the plaintiffs were tungsten, which reacted better to the acid test than platinum even.

The jury found that the purchases were not made on the faith of a warranty that the points were platinum; that the purchases were not induced by fraud; that the plaintiffs purchased 999 pairs expressly subject to analysis; that the plaintiffs were not guilty of negligence towards the defendant in testing the points; and that the defendant bought on the strength of plaintiffs' statement of the result of the test.

The judge found that the plaintiffs were entitled to judgment for £200 with costs, except that defendant was entitled to the costs of the issue as to warranty, as to fraud, and as

to mutual mistake. The plaintiff recovered on the ground that the delivery of the 999 pairs was subject to analysis, and that, the analysis proving unsatisfactory, the contract failed. As to the counter-claim, the defendant was entitled to £73 10s. with costs, but the plaintiffs were entitled to the costs of the issue as to the sale of 999 pairs and 2,400 pairs. Judgment was entered accordingly.

A Borough Electrical Engineer's Libel Action.

AT the Manchester Assizes on July 16th Mr. Ralph Lomax, the borough electrical engineer of Stockport, sued Messrs. Connell & Bailey, Ltd., the proprietors of the *Stockport County Borough Express*, for damages in respect of the publication of two letters in that journal, which, the plaintiff alleged, reflected upon him. The defence was that the published words had no defamatory meaning, and that they were fair comment upon matters of public interest. The case is fully reported in the *Stockport Advertiser* for July 17th. The jury awarded Mr. Lomax £10 damages in respect of each letter, and Mr. Justic Fraser certified for a special jury.

General Electric Co., Ltd., v. Dobson.

AT the Newcastle County Court recently the General Electric Co., Ltd., Newcastle, sued J. E. Dobson, a motor engineer, for £8, the balance of the price of an electric sign. The defendant complained that the plaintiff company, instead of supplying a sign with a front consisting of a single piece of opal glass, had inserted panelled glass. A witness for the plaintiff company explained that this was done to enable the front to withstand a greater wind pressure. The defendant agreed to pay the balance if his instructions were carried out, and on this understanding Judge Greenwell adjourned the case *sine die*, making no order as to costs.

Parliamentary News.

[By Our Special Parliamentary Reporter.]

The London and Home Counties Electricity Supply Scheme.—In our necessarily abbreviated report of the proceedings before the Select Committee of the House of Lords which is dealing with this Order (ELEC. REV., July 10th, p. 52), we stated that Mr. Sydney Morse, who appeared for the four-company group, supported an amendment proposed by Mr. Seager Berry, for the ten-company group, exempting those authorities which were not represented on the Joint Authority from the necessity of contributing to the funds of that body. Mr. Morse informs us that he did not support the amendment, of which he had not had notice. He merely agreed with Mr. Berry that the scheme had been sufficiently discussed in the course of the various departmental inquiries and the committee stages of the Nos. 1 and 2 Bills.

The London Tubes.—On July 14th, Dr. SALTER asked the Minister of Transport whether a public inquiry was to be held as to the advisability of constructing a tube railway in South-East London; if so, when such an inquiry was likely to take place and by whom it would be held; and whether the local authorities of the South London Boroughs would be permitted to give evidence.

Col. ASHLEY said that the answer to the first part of the question was, so far as he was aware, in the negative. He had referred to the London Traffic Advisory Committee, for its advice and report, questions relating to the alleged inadequacy of passenger travelling facilities in certain districts of London, including the South-Eastern district. The Committee informed him that it proposed to hold public inquiries in connection with these questions, and that it would afford every opportunity to the local authorities concerned to present their views on the questions involved.

Imperial Radio Communication. — On July 14th, Mr. AMMON asked whether, in connection with the development of the Empire wireless chain, the sites had yet been acquired for the erection of the stations for communicating between Great Britain and Australia and India.

Lord WOLMER, Assistant Postmaster-General, said that sites near Grimsby (for the transmitting station) and near Skegness (for the receiving station) had been selected for the beam stations for communication with Australia and India, and it was hoped that the purchase of the various properties concerned would be completed at an early date. The order for the erection of those stations had already been placed with the contractors.

Anglo-German Telephone Service.—On July 14th, Lord WOLMER informed Lt.-Commdr. KENWORTHY that it was hoped to open an Anglo-German telephone service in about 12 months' time. The circuits would pass through Holland. The submarine cable was on order by the Dutch Government, and the various land lines were being laid.

B.B.C. Profits.—On July 14th, Lord WOLMER informed Sir R. GOWER that the whole of the profits received by the British Broadcasting Co. after the payment of 7½ per cent. dividend, which absorbed only £5,172, had been invested in additions to plant. The Postmaster-General did not propose to reduce the licence fee pending the report of the Committee which the Government was about to appoint to examine the arrangements, financial and otherwise, for the maintenance of the broadcasting service.

Published Specifications.

Compiled expressly for this journal by Patent Agents.
The name of the applicant's patent agent, if any, will be found on the prin specification.
The numbers in parentheses are those under which the specifications will printed and abridged, and all subsequent proceedings will be taken.

Extra-High-Pressure Cables.

IT is an interesting comment on Mr. Everett S. Lee's paper before the American Institute of Electrical Engineers on "Testing High-Tension Impregnated Paper-insulated Lead-covered Cable," that the reports of the annual meetings of the shareholders in two very prominent British cable-making companies have announced in the one case the execution in this country of an important order for 75,000-volt cable, and in the other case the acquisition of an interest in an American cable-making company with a view to making e.h.p. cable behind the shelter of the Fordney Tariff.

It is, moreover, of interest that the discussion on Mr. Lee's paper and on that by Messrs. Del Mar and Hansen, recorded in recent issues of the *Journal* of the A.I.E.E., would seem to indicate that the experience of our American friends with 33,000-volt and 66,000-volt cable has been beset with a certain amount of trouble. We, too, have had a little, and apparently have found solutions. But habituated as we are to decrying our own performances, neither the C.M.A. nor its critics have found it necessary to confess to the occupation by Great Britain of a subordinate position in cable manufacture. Initially, perhaps, the difficulties may be said to have been due to the magnitude of the advance. The rules of design as to the proportioning of dielectric thickness for 6,600- and 11,000-volt cables —of which there are thousands of miles in existence— represent the advance due to years of experience, but when we consider the 33,000-volt cable, it is evident that pressures five times 6,600 volts introduce factors which are not in direct arithmetical proportion to the increased pressure. Still less is this the case when we have to consider the vital questions of uniformity of materials and uniformity in construction. At the lower pressures our factors of safety were such that the possibility of minor irregularities in impregnation did not greatly worry us. To-day, at pressures of 33,000 volts and over, the situation in this respect is greatly changed. To take a mechanical analogy, it is almost as though after for four or five generations using steel of 26 to 30 tons ultimate strength and working at one-third the elastic limit, we received for the first time a new alloy steel of 50 to 55 tons ultimate strength, and were compelled to work this up to 90 per cent. of its elastic

limit, with the added nightmare that the steel manufacturer could not guarantee uniformity of the metalloid constituents or uniformity of heat treatment.

We imagine that the magnitude of the change in pressure caused Mr. Lee to review the matter in the paper now under consideration, which was read in New York last February. Its summarised conclusions do not call for much critical examination: there is the dictum that "values of insulation resistance are of doubtful worth as a means of distinguishing between satisfactory and unsatisfactory cable"; "the test for dielectric strength is the most important and the best now available as a suitability test"; and "measurements of dielectric power loss and power factor are of value and should be continued." We doubt, however, the practicability of "periodic testing at voltages which will not injure sound cable, and which will only affect cables when the deterioration has been abnormal." Unfortunately the author does not define the percentage above normal pressure that would produce this result. Such periodic tests can, of course, be applied, when it is possible to isolate one of two e.h.p. feeders or to isolate one segment of a ring main. But an application of a test pressure to a cable *in service*, which will be sufficiently in excess of the normal voltage to be discriminatory, seems to us to be asking for trouble, in that it ensures the breakdown of a weak cable at an earlier date than would naturally be the case. That date may be merely days earlier, but if there should be any feeling that failure has been accelerated by weeks, most of us would prefer to wait and allow sleeping dogs to lie. The only good reason for making such a test appears to us to be that it could be applied at a slack time of year, when the removal of the cable from service would offer the least inconvenience. In other words, we should select the time for an inevitable breakdown to take place, rather than leave it to mature perhaps at a most inconvenient season. We note, however, that one speaker in the discussion expressed a firm belief in the proof testing of cables after installation—at six-monthly intervals and at one and a half times the working pressures, for fifteen minutes. The same speaker had no illusions as to what sample tests meant—he pointed out that on a 10-ft. piece for bending test the results do not reveal whether or not a 10-ft. sample cut from the other end of the cable will be as good as the first in meeting the bending test, and that there is nothing to indicate that a 10-ft. piece cut from the middle of the cable would yield as high a value.

Other speakers covered a wide range. One confessed that one-third of the failures in service revealed absolutely no discernible cause, and this speaker also put forward a figure-of-merit table based on inspections and tests on an order for 3-core, 13,000-volt cable distributed over seven factories. Points were awarded under 15 headings, six being for mechanical, five for electrical, and four for puncture tests. This table, which illustrates the differences in value in excess of specified limits, is certainly suggestive, but we are not sure that the scheduled scale of weights is correctly proportioned. The probability also remains that different scaling is necessary for 15,000-, 33,000-, and 66,000-volt cables. In any case the proof of the pudding lies in the eating. The seven cases cited vary in their figure of merit from 84.3 to 68.1 per cent. It will be of great interest—should the facts ever be disclosed—to learn five or six years hence whether there is any relation between the empirical total figure-of-merit value formulated and the working life, with special reference to the further question of the relation of the failure to the corresponding points making up the figure of merit. The possible fallacies in devising any figure of merit are indicated by the fact that it is most improbable that any two samples, 10 ft. in length, from the same drum would have identical values.

Passing to testing methods, the consensus of opinion was favourable to the e.h.p. direct-current method. When, however, the dielectric losses are low, recourse to recording instruments is necessary. Of even greater interest is the question of decomposition of the impregnating oil—a phenomenon akin in some of its asp to the sludging of transformer oil.

Finally, there is the question of what are to be test pressures and their duration on the finished cal Many will feel that our current practice of applyin test pressure of 75,000 volts for fifteen minutes at works to a finished 33,000-volt cable is unnecessa drastic—it is always conceivable that too high a pressure is a cause of incipient faults, which develop later. In this connection it would be inter ing—but expensive—to experiment with two drum one submitted to twice and one to three times the wo ing pressure for fifteen minutes. Afterwards a se of test samples could be taken from each drum broken down. Any marked difference between the of samples would be almost conclusive. We use qualification "almost," as we cannot at the works ceed in simulating the effects due to ageing.

Some day, when all the information now availa (and more with regard to performance when laid) been co-ordinated and when we all really underst what constitutes uniformity of impregnation and ensure uniformity of materials, the manufacture 66,000-volt cable will present no more anxieties than have to-day over cables for one-tenth of that pressu By that time we shall perhaps have a fresh set anxieties about 200,000-volt cables.

The New Showrooms at Liverpool.

ELSEWHERE is this issue we m reference to the opening of new sh rooms by the Liverpool Electricity partment, and reproduce some ph graphs of the premises. It is evid that the Corporation is making a great effort to bu up its domestic load, and a well-appointed and w managed showroom with a wide selection of appliar and intelligent demonstrations is an excellent means stimulating the interest of the domestic consumer.

Our illustrations scarcely do justice to the beautifu arranged apartments, but they serve to convey s impression of the care and thought that have b bestowed upon their decoration, furnishing, and "l out." We particularly like the idea of the lecture demonstration room. It will be remembered tha large demonstration room and lecture hall are feature the big showroom scheme which Hackney completes in early autumn. Practical demonstration is very ne sary, not only as a means of selling appliances, but to impart to customers a proper knowledge of th use. Many complaints of the expense of electric cook are solely due to ignorance of the special methods wh form one of its principal advantages.

Demonstration is not the only consideration, h ever; it is also necessary to have a reasonable rate domestic electricity. This has been thought of, t for the Corporation now has a two-part tariff, consist of 5 per cent. of the rateable value of the consume premises per quarter, plus a halfpenny for each k consumed. This should bring electric cooking and he ing within the reach of a very large section of population. Liverpool has set a very good example other large towns, and there is no doubt that expenditure which has been incurred will be repai hundredfold both from the financial point of view in the benefits which will accrue to the citizens from th adoption of electricity.

Spanish Industrial Progress.

IT will be seen from the report of British Commercial Secretary Madrid, which is reviewed in t issue, that there are a number of f ward movements in progress in Spa Hitherto the country has not been looked upon as industrial (or industrious) state, but it appears tha modification of this view is very necessary if we to form a true estimate of the position which Spain v occupy in a few years' time. Capt. Charles says that expansion of industry has shown a very considera

advance in the last few years. To-day there is very little which Spain does not produce, whereas before the war her manufactures were limited to a few lines. Some of her factories are so glutted with orders that they are unable to fulfil them. At the same time, Spain is still a large purchaser from abroad, and British manufacturers will find it profitable to study the market and make a bid for the business which is available. Activity has been very pronounced in the mining and metallurgical industries, as will be seen from the figures of production which we quote from the report. An outstanding feature of these industries is the rapidly-growing use of electric power. It is no doubt this and the railway electrification which is being undertaken in easy stages which have stimulated the development of the country's rich water-power resources. These amount in the aggregate to about 4½ million h.p., and about 1¼ million h.p. is already in use. We mentioned last week that a large scheme was being considered by a Pearson enterprise which was designed to provide all the electric power required throughout the province of Catalonia. It is noteworthy that an endeavour to enforce the use of Spanish plant and materials has been made by the Government in granting future concessions, but it is doubtful if Spanish industry can yet cope with this class of work. Capt. Charles reiterates the advice to would-be traders given in his last report, and sums up the requirements in two words, "efficiency" and "adaptability."

New Roads and Electric Mains.

We seem to have heard the last of the determined attempt which was made in the last session of Parliament and again in this one by certain county councils to place the cost of removing electric and other mains during the course of road reconstruction upon the public utility authority that owned them. The probable cost of this requirement is such a serious matter that the attempt has been equally strenuously fought, and with success, by the public utility authorities. Questions of this nature, of course, can only be raised when a public-utility concern is before Parliament with a Bill, and, as a matter of fact, the fight has been taking place in connection with some relatively small gas and water undertakings. The electricity and water supply authorities were involved, however, in what was a matter of important general principle, and concerted action was taken. The position can briefly be thus stated: In many road reconstruction schemes it frequently happens that a road may be doubled in width, and unless the mains which have been laid under the footpath are moved, they will be found under the surface of the new roadway, where not only will it be inconvenient to get at them for the purpose of repair, but they will also be subjected to a very much heavier traffic than the people who laid them originally ever contemplated. Thus they will be exposed to the risk of serious damage. Alternatively, they may be overlaid with a thick bed of concrete. Obviously, therefore, such mains must be moved to the sides of the widened roads, and with an ingenuity that did counsel credit, it was argued in one or two cases that this cost should fall upon the authority owning the mains, but not with much success. The point, however, was being pursued by the county councils in such a way that a conference of electricity, gas, and water authorities was held, and it was decided to bring the matter to a head in connection with the demands of the East Sussex County Council in relation to the Uckfield Gas and Electricity Bill and the Burgess Hill Water Bill this session. The County Council did not oppose when these Bills were before the House of Lords, but reserved the right to do so when they came before the House of Commons. The conference in question decided to fight the East Sussex County Council, and it was arranged that the expense should be borne between the three interests. Fortunately wiser counsel have prevailed, for when the Uckfield Bill came before the Unopposed Bills Committee of the House of Commons recently there was found in it a clause which laid it down that in the case of road widenings the cost of the removal of mains should be borne by the county council, whilst in the case of county bridges the cost should be borne by the authority owning the mains. The latter, of course, does not mean much, and was probably conceded in an endeavour to settle the matter. On the main question of principle, the public-utility undertakings have secured a valuable precedent, and it is hardly likely that other county councils will trouble further in the matter.

Electrical Progress in the United States.

The latest available figures of the growth of the electricity supply industry of the United States have refuted those who gave it as their opinion that the peak of progress was reached in 1923 and that thereafter the annual increment would gradually decrease. According to a survey recently completed by the *Electrical World*, 2,178,283 new customers of all classes were added to the service lines of the central stations during 1924, whereas during 1923, when progress was assumed to be at its highest possible level, the increase was 2,042,711.

It is shown that "domestic lighting customers" formed the most important class, their numbers rising from 11,613,348 to 13,395,887 out of a total of 16,555,714 at January 1st, 1925. We presume that this class covers domestic users generally, not merely those who use electricity for lighting alone. Commercial and industrial consumers also increased in number at a satisfactory rate, but there is no doubt that it is to the domestic load that American electricity suppliers are looking for the bulk of their revenue.

If the number of domestic consumers can show a growth of over 15 per cent. in a year in a country which is so well developed electrically as the United States, what are the possibilities in Great Britain?

There is little doubt that with the expenditure of a relatively small amount of money and effort, the mass of the people will be brought to a realisation of what electricity means.

British Engineering Standards Association.

In his review of the year's work of the B.E.S.A. at the annual meeting, which is referred to elsewhere in this issue, the chairman found himself able to strike a more hopeful note than was done this time last year, both as regards organisation as well as finance. The deficit carried forward from the previous year has been reduced, but it is sad to relate that there are no funds at present for carrying on the translation of British Standard Specifications into foreign languages, and accordingly their dissemination abroad has had to cease—a regrettable happening, and it is to be hoped that such valuable work will not have to be in abeyance for long.

It is announced, however, that a new scheme is to be put in operation next autumn whereby the Association's membership will be so reorganised as to allow the Main Committee to obtain the support of professional engineers, individual firms, and business men connected with all the great industries of the country. It is interesting to learn that individuals will now be given the privilege of becoming members of this important body. Membership will carry with it advantages too numerous to mention. The Prime Minister, who is personally familiar with B.E.S.A.'s work, has addressed a letter to the chairman expressing the hope that the Association will be successful in the effort now being made to widen the scope and influence of its work. Moreover, it is hoped that H.M. Government will eventually find itself in a position to give greater support than at present to the movement. It is confidently expected that all those connected with our great industries who are able to do so will lose no time in placing at the disposal of the B.E.S.A. Main Committee that additional measure of support which is so necessary in order to enable it to prosecute its national campaign successfully and, at the same time, make its work effective throughout the world.

D

New Showrooms at Liverpool.

The Corporation's Fine Display of Domestic Electrical Appliances.

THE Liverpool Corporation's new electrical showrooms, which occupy a commanding site in the centre of the town, were opened on July 20th by the Lord Mayor of Liverpool. The premises are situated in Whitechapel, within a stone's throw of Lord Street, which is one of the principal shopping thoroughfares of the city. The premises cost several thousands of pounds to adapt to the purpose for which they are now applied, and the result is one which does credit to the city of Liverpool. It is claimed that the showrooms, which contain about 2,000 electrical appliances, are the finest in the country. The premises were entirely re-modelled by Messrs. Ashby Tabb, Ltd., and the electrical furnishing and the arrangement of the displays were supervised by the city electrical engineer, Mr. H. Dickinson. Entering the premises on the ground floor, there is a fine reception hall (fig. 1) reminiscent of the Tudor period, replete with showcases fitted with glass shelves, which are wired and contain sockets so that plugs may be inserted for the display of lighting effects, &c. On the first floor there is a special showroom for the display of electric light fittings, pendants, shades and lamps of all descriptions. In this apartment alone there are on view close on 300 patterns of electric light fittings. The showcases, in old oak with glass shelves, are wired in the manner indicated above, and these display 96 varieties of shades and fittings. Adjoining is a demonstration room to seat about 70 persons (fig. 2). Here it is intended that specialists shall give demonstrations in cooking, washing, &c. On the second floor, fig. 3, which is reached by a lift, there is a whole host of appliances, from sewing machines to electrically-operated calculating machines. Adjoining there is a suite of four rooms approached through a little garden courtyard. A projecting window gives one a glimpse into a very cosily-furnished and electrically-lighted bedroom. On the right there is a passage illuminated by an antique flambeau. The bedroom opens into a bathroom. Then there are a dining room, a kitchen and a scullery. Space will not permit us to give a detailed review of the electrical exhibits which are so numerous and varied, but the showrooms certainly do justice to the progressive ideals of the City of Liverpool electricity department.

Fig. 1.—Part of the Reception Hall.

Speaking at the opening ceremony, Mr. H. Wilson, chairman of the Electricity Committee, said that there would be demonstrations at frequent intervals of all kinds of electrical appliances, and they could be depended upon that the showrooms would endeavour to keep the public informed of the latest developments in electrical devices for the home. Last year the Corporation decided to hire out electric cookers at a charge of 5s. per quarter, including fixing and maintenance. At the present time, continued Mr. Wilson, 800 cookers were installed, and a large demand was expected from the outside districts. If the department could develop the demand for electricity during the off-peak hours of the day, it would be possible to greatly reduce the cost of current.

Fig. 2.—The Demonstration Hall.

Fig. 3.—The Main Showroom.

A special domestic rate consisting of a fixed charge of 5 per cent. of the rateable value per quarter, plus a "running" charge of ½d. per kWh, has been instituted to encourage the use of electricity in the home.

Coal Mining in 1924.

Reports of the Secretary for Mines and H.M. Chief Inspector of Mines.

HE report of the Secretary for Mines contains much nformation regarding the coal output and wages for ie year 1924. Following a year of prosperity in 1923, ith an output second only to the record year of 1913, ith the exports exceeding even that year, it is much be regretted that the year 1924 was one of "gradu-ly deepening depression."

The boom of 1923 had been caused by the dislocation the Ruhr coalfield, and the resumption of normal pro-uction, as might have been expected, shattered it, and lated seasonable improvement then occurred, but the demand for house coal was lower than usual. In all 267 million tons of saleable coal was raised in 1924, as compared with 276 million tons in 1923 and nearly 287½ million tons in 1913.

The active developments in the newest coalfields is reflected in the higher level of output in Yorkshire, which was 7 per cent. greater than in 1913, and in Nottingham and Derbyshire, which was 2 per cent. greater. In all other districts except Kent, the output

en the year 1924 might have been worse had not the me demand at the beginning of the year improved—t this demand gradually fell off and prices declined. itput fell by 9 million tons, and exports by 19 llion tons. Values at the beginning of the year were od, but they subsequently declined, so that on balance ey showed little change from the previous year, for ile export prices were lower, inland prices were gher. The earnings of the workers were slightly gher than in 1923. Although 9 million tons lower an in 1923, the output in 1924 was higher than in y other year except 1907, 1911, and 1913. Up to e middle of May, a high rate was maintained and, cept for holiday periods, and a fortnight when trans-rt was disorganised by a strike of locomotive engine-en, it was not less than 5⅔ million tons in any week, d reached nearly 6 million tons in the second week April.

With the close of the house coal season, and the covery in the output of coal abroad, production de-ned, and fluctuated between 5 and 5¼ million tons week from June to the middle of November. A be-of coal was lower than in 1913. The difference amounted to 3 per cent. in the Staffordshire, Salop, Worcester, and Warwickshire district, 8 per cent. in Northumberland, 10 per cent. in South Wales and Monmouthshire, 12 per cent. in Durham, 17 per cent. in Lancashire, Cheshire, and North Wales, and nearly 15 per cent. in Scotland. It is interesting to observe that in the anthracite industry production has increased by one-eighth since the year 1922 and exceeded that of 1913 both in 1923 and in 1924.

The number of persons employed was 1,193,668 at the middle of May, the highest number recorded since the resumption of work at the mines after the national stoppage in 1921. By the middle of November the number had fallen to 1,135,380, but it increased subsequently to 1,137,173 at the end of the year, as compared with 1,184,786 at the end of 1923.

The export demand for British coal and coke, which reached "record" dimensions in 1923 owing to troubles in the Ruhr, was sharply checked in 1924. The production of coal at German mines increased from 6,302,000 metric tons in December, 1923, to 10,826,000 tons in

March, 1924, and 11,944,000 tons in October, when it was slightly greater than the average monthly output of coal in 1913 in German post-war territories. For this reason, coupled with the increased output from the mines in France, Belgium, and Holland, exports of British coal to these countries and to Italy declined in 1924 by no less than 20,000,000 tons, though even so they were only 1¼ million tons less than in 1913. Elsewhere British exports were 1½ million tons greater than in 1923, but were still nearly 13 million tons below the level of 1913. The total quantity of coal exported was 59,179,000 tons in 1924, 77,974,000 tons in 1923, and 73,400,000 tons in 1913.

With regard to home consumption, 180⅓ million tons was available for consumption in Great Britain in 1924, as compared with 168¾ million tons in 1923. The 1924 figure was approximately the same as that of 1920, the year of the post-war "boom" in trade, and was 3½ million tons less than in 1913. Deducting miners' and household coal, the quantity available for industrial purposes was about 140 million tons. Of this, 54½ million tons was used by the collieries, public utility undertakings, and railway companies (1¾ million tons more than in 1923), 14⅓ million tons in the manufacture of pig iron (rather less than in 1923), and for all other purposes 71 million tons (9⅔ million tons more than in 1923). These figures point to some temporary improvement in industry at home, except in the heavy iron and steel trades, which were affected directly or indirectly by the renewed activity of the Ruhr; but it is probable that to a large extent the increase represents replenishment of stock rather than actual consumption.

Over the year as a whole the average proceeds of coal disposed of commercially amounted to 19s. per ton, practically the same as in 1923. This the price at the pit-head, and the following are the ports annual average f.o.b. prices for exported coal 1913, 13s. 10d.; 1922, 22s. 7d.; 1923, 25s. 2d.; 19 23s. 5d.

As regards wages, the average earnings per man sh for all classes of labour were 10s. 3d. for the first f months of the year under the old 1921 agreement, 10s. 10¼d. under the present agreement, which exp at the end of this month, for the remaining eight mon of the year. The wages, of course, for the skilled were very much higher than this. The following gi

particulars of the average income for the year from sale per ton of the coal and its disbursement:—

Gross proceeds	19s. 10¾d.
Costs other than wages ...	5s. 5¾d.
Net proceeds	14s. 5d.
Wages costs	13s. 3d.
Gross profit	1s. 2d.

Total output per man shift, 17.59 cwt.
Average earnings per man shift, 10s. 7¾d.
Average number of shifts worked, 260.
Average yearly earnings per man, £138 4s.

The highest earnings were in Scotland of £150 3d. for 277 shifts, the average profit being 10d. ton, and, strangely enough, in Kent, where the earn

-e given as £150 1s. 1d. for 241 shifts, while the vners made a loss of 2¼d. per ton. Bristol district as the lowest with £113 0s. 11d. for 267 shifts and a ss of 6½d. per ton. It must be remembered that in all stricts there is a minimum wage irrespective of pro-uction.

As showing the shocking state the industry is in, it ould be noted that whereas the first four months of e year showed an average profit for all districts of . 10d. per ton, the highest being 3s. 9¼d., and the west (Cumberland) 1½d., none showing a loss, while r the last eight months the 2s. 10d. had dropped to l.; only four showed a profit, and the remaining ne districts showed a loss varying from 2s. 4¾d. per n in Cumberland to ¼d. per ton in South Staffordshire id Salop.

£6,023,001 was paid on account of royalties and ayleaves, including the rental value of freehold inerals where worked by the proprietor, very much of hich went to the State in the form of taxes. If, how-er, this amount had been divided amongst the work-en it would have given them about 8½d. per shift orked. On the other hand, 24,907,890 shifts were lost iring the year which could have been worked, repre-nting a loss in wages of over £12,000,000 and a loss output of over 21,000,000 tons of coal. Table C ows the tonnage of coal disposable commercially, and e average costs of production, proceeds, and profits r each quarter of the year 1924 in more detail.

Electrical equipment is still increasing, as tables , B, and D show.

The number of flame safety lamps in use was 576,318, against 584,761 in 1923. The number of electric safety lamps in use was 356,817, as against 327,929 in 1923.

The number of horses and ponies employed in 1924 was 65,210, as against 65,579 in 1923.

The Manchester Mining Exhibition.

A Brief Review of the Electrical Apparatus Displayed.

: is unfortunate that the third Colliery and General ining Engineering Exhibition, which was held at Man-ester from July 7th to 18th (the last having been eld 12 years ago) should have been staged at a time hen the coal trade is under such a very heavy cloud depression. The display was a very comprehensive ne, and was spoken of on every hand as excellent, every ranch of mining engineering being represented, and a udy of the exhibits left the visitor with one feeling ppermost in the mind, *i.e.*, the crying need of the al industry—stability. The latest appliances were own, and were a credit to British manufacture, but ho can blame the owner for hesitating to embark on ceptional capital expenditure under the circumstances hich have pertained during the last few years? evertheless, it is necessary to show reasonable optimism, nd the exhibition certainly encourages that aim. The ectrical side of mining was given its fair share of rominence, and the following notes will give some idea the scope of this department. Electricity was not reated in any way as a separate section, but in its atural order, as an integral part of the whole.

On the stand occupied by the University of Edin-urgh and Heriot-Watt College the chief item of interest as the "Carboscope," the use of which was referred to a paper read before the recent Radiological Con-ress. It is an X-ray examination set, by Messrs. ent, McLaren & Thomson, of Edinburgh, by means which the mineral content of coal can be ascertained a glance, so that various grades of coal can be easily assified according to the fuel value, and the develop-ent of the device would seem to be of the greatest terest to all users of coal. It consists of a steel tank, led with a highly-insulating oil, immersed in which are high-pressure transformer and a Coolidge X-ray tube of the radiator type, these being connected together under oil. The transformer is of the step-up, closed-core type, and in the present instance gives 60,000 volts peak output. The X-ray tube employed is of the hot-cathode type, and two external terminals only are required, by means of which low-voltage alternating current is applied to the primary windings of the trans-

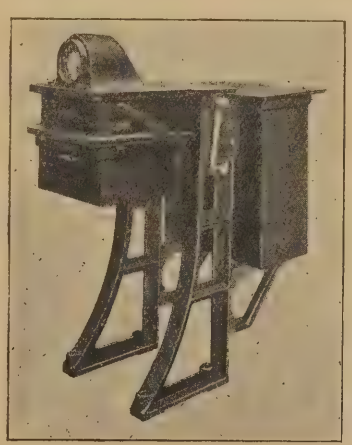

Fig. 1.—F.P. Circuit Breaker; 1,200 Amp.

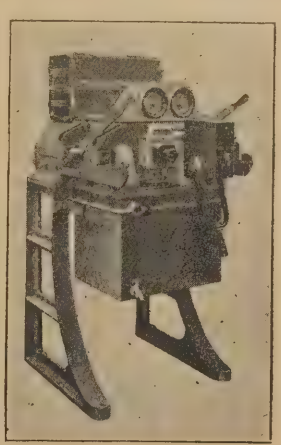

Fig. 2.—F.P. Flameproof Auto-transformer Starter.

former. The whole outfit is compact and devoid of adjustments, or unnecessary accessories; there are no moving or rotating parts, and the whole is noiseless in action. The lid of the tank has near its centre a comparatively small opening through which emerges in an upward direction a cone-shaped beam of X-rays. If, therefore, an object is placed in the path of the

beam and examined by means of a suitable fluorescent screen, the projected shadow will reveal the structural details of the object under examination, provided that its thickness or character are not such that they affect the total absorption of the radiation.

The "Clinophone," another instrument shown, is used in surveying boreholes for the freezing and cementation processes of shaft-sinking, where only extremely slight deviations are permissible. Orientation is by means of rods, and no magnet or gyroscopic compass is needed. The instrument is a continuous recorder, and is very rapid and accurate; deviation to within two minutes of arc is given. A hot-wire anemometer was also on view.

Messrs. Allen West & Co. had a large stand, on which could be seen complete control equipment for a 750-h.p. winder, comprising a liquid rotor controller, h.p. contactor, stator reverser, with lever operating gear assisted by a compressed-air engine. Amongst many electrical exhibits, mention should be made of the "S. R. I." oil-immersed stator and rotor starter for use with 3-phase a.c. slip-ring induction motors up to 650 volts. This starter is of the ironclad totally-enclosed, dust- and weather-proof type assembled in one case, thus minimising the space required. The stator circuit is controlled by a 3-pole contactor circuit breaker, while a face-plate starter is used to control the rotor circuit. The rotation of a handwheel first closes the stator circuit, and subsequent revolutions cut resistance out of the rotor circuit. A quick step-to-step movement is made between the rotor notches, and an

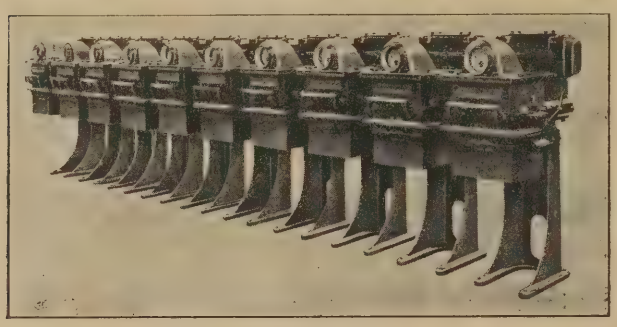

Fig. 3.—F.P. Flameproof Switches.

indicator shows which notch the starter is on. The operator does not have to make two distinct operations when starting a motor, and overload and no-volt protection is provided.

Messrs. Heyes & Co., Ltd., had a display of "Wigan" mining specialities, the newly-patented prismatic lamp-fitting being probably the outstanding feature of interest. It has been specially designed for use in low and narrow roadways, &c., and by means of the prisms the light is reflected over an area of 180 deg. from the plane of the fitting. It does not occupy any more space than the standard bulkhead fitting, and yet gives a normal front illumination with an increased side illumination up and down the roadways. The prismatic glass is of exceptional strength requiring no wire guard to protect it, with no consequent decrease of illumination. The fitting has explosion-proof joints, and the lampholder is already wired to connector blocks; it is fitted with one, two, or three armour glands, or screwed for tubing, and will not only be of use in mines, but also on board ship, in any place with low ceilings, subways, &c.

Messrs. Ferguson, Pailin, Ltd., exhibited representative types of switchgear generally used for mining purposes. Commencing with the larger sizes, such as could be used in the colliery power station or receiving sub-station, a metal-clad, compound-filled "ED" unit suitable for a duplicate busbar system was shown; selection of bus-bars is accomplished by an oil-immersed switch mechanically operated from the front and interlocked with the main oil circuit breaker, the current and potential transformers being accommodated in the draw-out portion of the unit and are oil immersed. Overhead transmission lines are now co mon in connection with colliery work, and an outd switch of the rocking type suitable for pole mount and remote mechanical operation was on view. Wh intended primarily for isolating only, it is fitted w arcing horns to enable the magnetising currents small transformers to be broken; an outdoor oil f suitable for the protection of such transformers sub-circuits was also shown. To deal with the he l.p. currents sometimes met with in mining work totally-enclosed type "C" unit has been desig (fig. 1). It is of the horizontal draw-out type, an bus-bar adapting chamber can be fitted to enable unit to line up with the standard "B" (fig. 3) a

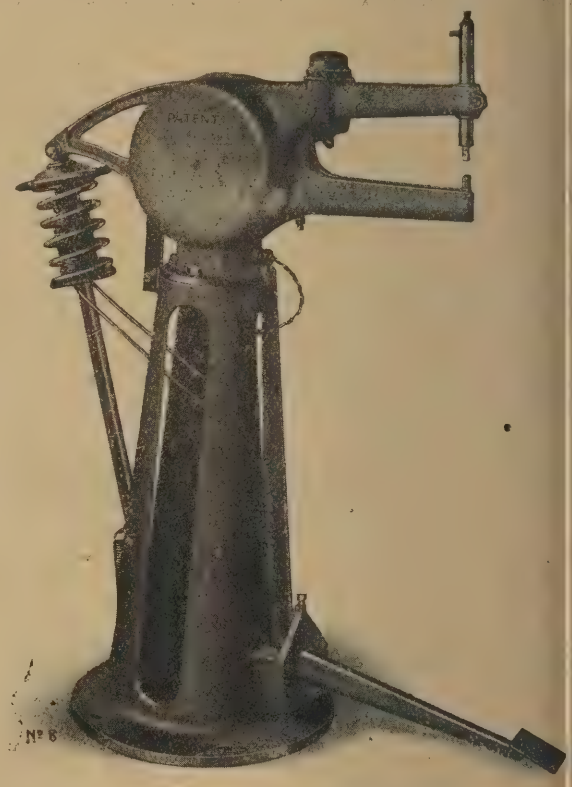

Fig. 4.—A New Process Co. Spot Welder.

"C" units, which are suitable for use in sub-stati both on the surface and underground. The control sub-circuits and squirrel-cage induction motors catered for by the "A" unit, which can be obtai in the following types:—Main switch, change-o switch, series-parallel switch, star-delta starter, auto-transformer starter (fig. 2). These units may made flameproof.

The New Process Co.'s recently-brought-out wel was to be seen on the stand of Messrs. Ogilvy & The chief point is the attempt that has been made eliminate the human element by the incorporation an "Ermack" automatic current controller, wh cuts off the current immediately the weld is complet Variation in material thickness or surface oxidat does not influence the efficiency of the machine. Fig illustrates a spot welder, but the firm also makes se and butt welders.

The Diamond Coal-Cutter Co., Ltd., had a fine play of cutters, jigging conveyors, and switchgear. latest electric chain coal-cutter is driven by a 30-h totally-enclosed motor, and the machine itself ha 15-in. cutting floor level, is 8 ft. 9½ in. in length a 2 ft. 3 in. wide, and two 2 tons 16 cwt. in weight. electric jigging conveyor driving gear is a comp exhibit; varying lengths of stroke are arranged f and the gear can be coupled to the troughing for dir end or under drives, or rope drive through a bell cra

The Wolf Safety Lamp Co. and Federation Lamp had a joint stand, with a comprehensive display of th products, including the Maurice-Wolf nickel-cadmi 2-c.p. mine lamps with removable battery covers.

(To be concluded.)

Belt and Rope Driving.

The Attendant Pull on the Shaft.

By W. R. NEEDHAM.

THE writer has known of cases of shafts breaking down almost immediately outside the journal at the driving end of an overhung belt pulley machine. When the stresses came to be calculated more carefully after the mishap, it was found that the bending stress alone was at least 10,000 lb. per sq. in—probably upwards of 11,000 lb. per sq. in. This is much too high a figure for the ordinary shaft material used, especially having regard to the alternating nature of the bending stresses (two reversals for each revolution), and to the fact that shear stresses due to driving torque co-exist.

The object of the present short notes is to express the pull on the shaft due to belt and to rope driving respectively in convenient form. It is one of those simple calculations, which are yet tricky; and mistakes have been made which a little thought and some application of first principles would have obviated.

It is well known that the effective force F transmitted by a belt $= T - t$ lb., where T is the force in lb., on the tight or driving side, and t is the force, in lb., on the slack side. Consequently, the horse power transmitted $= (T - t)v/33{,}000$, where v is the belt velocity in feet per minute.

Thus $T - t = F = 33{,}000 \times$ horse power$/v$ lb. .....(1)

Also $T/t = e^{\mu\phi}$ or $\log T/t = 0.4343\ \mu\phi$.....(2)

where μ is the coefficient of friction for belt and pulley; ϕ is the belt included angle (in radians); and e is the base of natural or Napierian logarithms ($= 2.718$).

The value of μ for leather on cast iron is approximately .3 for ordinary velocities, though it is doubtful whether a really close figure can up to the present be given. The angle ϕ is usually round about 180 deg. (π radians) for most cases one is up against. It may reasonably enough be taken at that figure, especially for open drives.

Thus, from (2), $\log T/t = 0.4343 \times .3 \times \pi = .4095$; whence $T/t = 2.567$; $t = T/2.567$; and $T - t = (2.567 - 1)T/2.567 = 0.611T$, where $\mu = .3$, and $\phi = 180$ deg.

In this case, therefore, (1) becomes $F = 0.611T = 33{,}000 \times$ h.p.$/v$ lb.; $\therefore T = 54{,}000 \times$ h.p.$/v$ lb. .....(3)

and $t = 0.389T = 21{,}000 \times$ horse power$/v$ lb.....(4)

Now (3) and (4) can be expressed in possibly a more convenient form. If N be the speed in revs. per min., and R the mean radius of the belt (in inches), then $v = 2\pi RN/12$ .....(5)

Substituting, we obtain

$T = 103{,}100 \times$ horse power$/R \times N$ lb.....(6)

$t = 40{,}100 \times$ horse power$/R \times N$ lb.....(7)

Similarly, $F = 63{,}000 \times$ horse power$/R \times N$ lb.....(8)

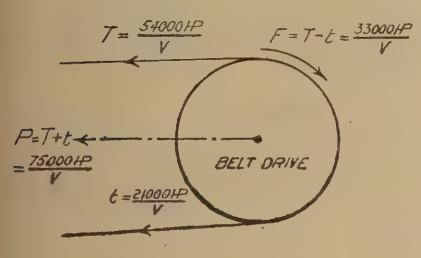

Fig. 1.

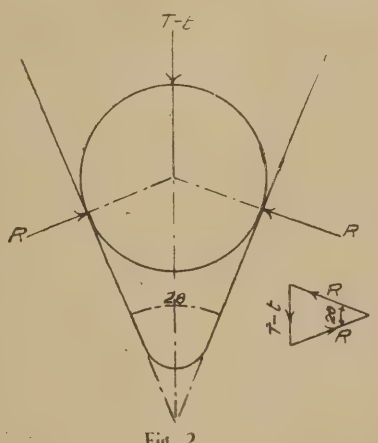

Fig. 2.

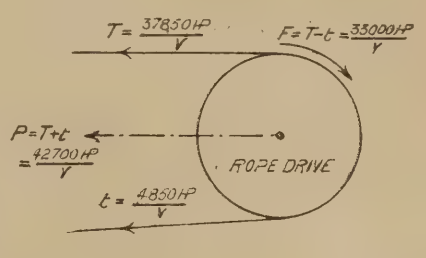

Fig. 3.

Now, the pull P on the shaft, with which we are principally concerned $= T + t$ lb. $= (3) + (4) = (6) + (7)$.

Thus $P = (54{,}000 + 21{,}000)$ horse power$/v = 75{,}000 \times$ horse power$/v$ lb.....(9)

$= (103{,}100 + 40{,}100)$ horse power$/R \times N = 143{,}200 \times$ horse power$/R \times N$ lb.....(10)

Reference to fig. 1 should assist any reader who may find the explanation lacking in clarity.

The effective rope pull in a rope drive is of the same general order of things as the belt pull we have just considered.

Here again $F = T - t = 33{,}000 \times$ horse power$/v$ lb....(1)

F in this connection can apply either to the force *per rope*, or the force for the complete pulley installation.

In order, however, to avoid any confusion we will take F as the effective force *per rope*. Thus in what follows horse power means horse power per rope.

Here, as in the case of belts, we can put $\log T/t = 0.4343\mu\phi$ (2), if we regard μ as an equivalent coefficient of friction. The value of this equivalent μ depends directly upon $2R$, and $2R = (T - t)/\sin\theta$, where θ is half the groove angle (in degrees). Reference to fig. 2 should help to elucidate matters.

Thus, when the groove angle $2\theta = 40$ deg., $2R = 2.926\ (2 - \phi)$; and when $2\theta = 45$ deg., $2R = 2.616\ (T - t)$.

Accordingly, if the real coefficient of friction for rope on iron be, say, 0.25, then the equivalent μ for a groove angle of 40 deg. will be $2.926 \times 0.25 = 0.731$, and for 45 deg. it will be $2.616 \times 0.25 = 0.654$.

By taking ϕ for general purposes as π radians, and 2θ as 45 deg., we ought to be sufficiently near the mark for ordinary calculations. All we need to remember is that where greater accuracy is required we must correct our values of ϕ, θ, and μ to suit. On these assumptions then we put

$\log T/t = 0.4343 \times .654 \times \pi = 0.892$;

whence $T/t = 7.798$; say, 7.80.

Consequently $t = T/7.80$; and $T - t = (7.80 - 1)T/7.80 = 0.872T$.

In this case, therefore, (1) becomes

$F = 0.872T = 33{,}000 \times$ horse power$/v$ lb. per rope;

$\therefore T = 37{,}850 \times$ horse power$/v$ lb. per rope. (11)

and $t = 0.128T = 4{,}850 \times$ horse power$/v$ lb. per rope. (12)

Then P, the pull on the shaft, $= T + t$ lb. $= (11) + (12)$,

$= (37{,}850 + 4{,}850)$ horse power$/v = 42{,}700 \times$ horse power$/v$ lb. per rope..... (13)

If there are n ropes, then P = total $42{,}700\ n \times$ horse power$/v$ lb.....(14)

Expressing T, t, and P in terms of $R \times N$, where R is the mean radius of rope in inches, and N is the speed in revs. per minute, we obtain

$T = 72,300 \times \text{horse power}/R \times N$ lb. per rope.....(15)

$t = 9,270 \times \text{horse power}/R \times N$ lb. per rope.....(16)

$P = 81,570 \times \text{horse power}/R \times N$ lb. per rope.....(17)

and P total $= 81,570\ n \times \text{horse power}/R \times n$ lb.....(18)

Fig. 3 illustrates diagrammatically the pull P, as compounded of its component rope forces T and t.

Mr. R. Livingstone, in his valuable book on "Mechanical Design and Construction of Generators" (now unfortunately out of print), gives P for belt and rope driving respectively. In the former case he assumes t to be half T, and in the latter t to be one quarter T. Consequently, corresponding to (9), P for belt drive is $99,000 \times$ horse power/v lb.; and corresponding to (13), P for rope drive is $55,250 \times$ horse power/v lb.

The values given in this contribution are a compromise between Livingstone's and those which Goodman's "Mechanics Applied to Engineering" would seem to favour. The late Prof. Perry, in his "Applied Mechanics," suggests for belts that $\mu = .3$, and for ropes an equivalent .6. Thus, values deduced therefrom would agree fairly closely with those tentatively offered in this article.

The actual calculation of horse power transmitted by any specific belt section or rope is really outside the scope of the present short contribution. The effect of centrifugal force on the material has to be considered. For ordinary purposes, however, the tabled data to be found in any reliable handbook can be worked to with reasonable confidence.

A "Relay" Automatic Telephone Exchange.

A "Cut Over" in an Admiralty Establishment.

On June 23rd there was "cut over" at one of H.M. naval establishments a "Relay" automatic branch exchange (p.a.b.x.), which is at present equipped for 550 lines. This exchange, which, we understand, is the largest automatic telephone installation in any British naval establishment, is interconnected with a 50-line "Relay" automatic exchange (p.a.x.) which was

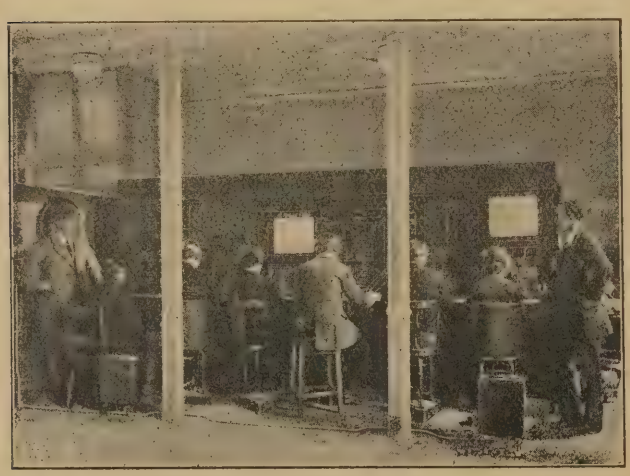

Fig. 1.—Old 6-position Manual Board.

brought into service at a subsidiary establishment some weeks previously. The large p.a.b.x. has been installed in a newly-erected telephone building, and has replaced a six-position manual board (fig. 1), which was originally a two-position board installed in 1907, four positions having been added subsequently. Eleven operators in three shifts and one supervisor were employed on this equipment.

The "Relay" p.a.b.x. (fig. 2) is fitted with a two-position manual board, the subscribers' jacks being arranged in three panels; the operator, therefore, has ready access to any subscriber's jack. The manual board is used only for calls to the public exchange, and as such calls amount to only one per cent. of the total traffic (the other 99 per cent. being dealt with entirely automatically by the "Relay" plant), it has been possible to give a much more efficient outside service and, at the same time, to dispense with nine of the operators necessary under the previous system.

The commander-in-chief and all establishments, such as the engineers, central offices, workshops, main offices, barracks, cashiers, and police, are linked up by an entirely automatic service which effects its connections day or night in three seconds, while two very important distant stations are connected by the switchboard, which also serves all vessels in the harbour. Some of these lines are three miles from the automatic exchange, and the 50-line subsidiary automatic exchange employs no operator whatsoever. Facilities are provided through the large exchange for any 16 officials to hold a con-

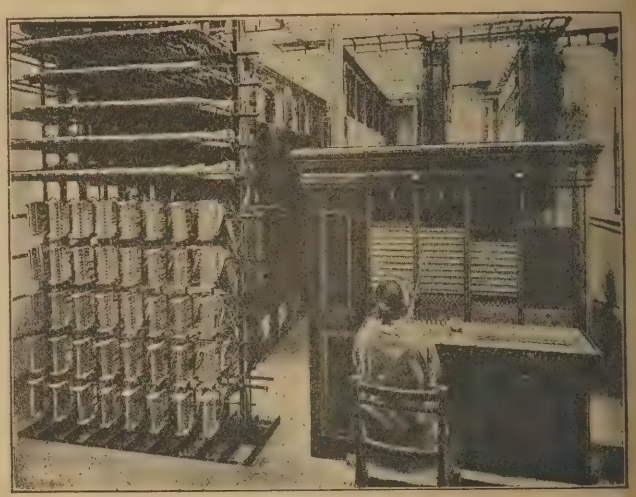

Fig. 2.—"Relay" Automatic Branch Exchange.

ference, and three officials have priority of service, while on the subsidiary exchange three high officials have the same privilege.

The exchange is similar to the "Relay" equipment supplied to the British Post Office, with standard dialling, ringing, and "busy-back" tones. Provision is made on the large exchange for 10 two-party lines with selective ringing; alarms to indicate exchange faults are provided and, according to the nature of the fault, either a delayed or instantaneous signal is given, depending on the importance of the fault.

The 550-line exchange is equipped with two sets of Chloride batteries of 340 ampere-hour capacity, both exchanges, by the way, being of the latest 32-volt model. Two ringing machines are fitted in the 550-line exchange, one of which runs off the 220-volt mains and the other off the exchange battery; the 50-line subsidiary exchange is also equipped with duplicate ringers.

Gas Firing at Dalmarnock.—Ex-Bailie W. B. Smith, Convener of Glasgow Corporation Health Committee, read a paper on "The Smoke Problem Solved" at the Royal Sanitary Institute Congress at Edinburgh last week. Having explained the initiation of the plant at the Dalmarnock gas works, now nearing completion, for the production of smokeless fuel and industrial gas by the Maclaurin process, Mr. Smith said that after the plant at the gas works had been working long enough to give them the experience necessary, they would at once consider putting down plant at the electricity generating station to carbonise about 500,000 tons of coal per year, to supply gas to fire all the boilers there, and produce 275,000 tons of smokeless fuel for the use of the citizens; 7,800,000 gallons of oil would be obtained from their own coal, instead of having to be purchased from abroad. They would also consider putting down plant to supply gas to works and factories in the area, and plant in the gas works at Provan to supply Maclaurin gas in the great industrial area adjoining it. There were those, Mr. Smith added, who did not see much necessity for Government help, except in special cases; most local authorities owning gas works or electricity stations could install the system themselves on a paying basis as a sound commercial proposition.

Legal.

Gas and Electric Securities, Ltd.

MR. JUSTICE EVE, in the Companies' Winding-up Court, on July 21st, heard the petition of the Northern Exploration Co., Ltd., for the compulsory winding up of Gas & Electric Securities, Ltd. Counsel said it was the petition of an unpaid judgment creditor for £17,000; no notice of opposition had been given.

His LORDSHIP said that he saw that the company had a paid-up capital of £2, but Counsel could take the required order.

The usual winding-up order was accordingly made.

Strand Electrical and Engineering Co., Ltd., v. Gee.

MR. JUSTICE ROCHE heard in the King's Bench Division, on July 22nd, an action by the Strand Electrical & Engineering Company, Ltd., Floral Street, Covent Garden, against Mr. Hugh Gee, South Kensington. Plaintiffs claimed £310 7s. 11d. balance of an account of £409 17s. 11d.

Mr. VAN DEN BERG, for plaintiffs, said the issue was whether credit was given to Mr. Gee or, as he alleged, to the Gee Construction Co., Ltd., which was now insolvent. The work claimed for was done in April last in connection with what was known as the Wembley airship, which was invented by Mr. Gee. The plaintiffs had never heard of the Gee Construction Company until long after the work was done. A sum of £49 10s. was paid on account by the company's cheque, but the plaintiffs did not pay any particular attention to the circumstance that the cheque was the company's. A second payment of £50 in cash was made by Mr. Gee.

Mr. PHILLIP SHERIDAN, general manager of the plaintiff company, giving evidence in support of the claim, said that Mr. Gee was a decorative artist and designer and the plaintiff company had done work for him personally before this particular work was undertaken. Mr. Gee had never mentioned the company.

Mr. GEE said that previous to this plaintiffs had done work through him for Barker's and other people but not work for him personally. He had not sufficient money himself to have this invention used at Wembley and formed a company with a capital of £2,000. Most of that sum was subscribed. He told Mr. Sheridan of the formation of the company, and the latter admitted the debt.

His LORDSHIP said the defence had been established to his satisfaction. Judgment was therefore entered for defendant with costs.

Coley v. Plum.

AT the Torquay County Court on July 22nd, before his Honour Judge Higgins, Mr. S. C. Coley, an electrical engineer, sued Mr. A. J. Plum, proprietor of the Hotel Regina, Torquay, for £16 6s. in respect of radio apparatus supplied. The defendant counterclaimed £32, the amount paid for a radio installation which, he alleged, had wholly failed.

Counsel for the plaintiff stated that his client originally installed a "Burndept" set in the defendant's premises, but at defendant's request he replaced it with a four-valve set of local make. This set was demonstrated to him and he agreed to purchase it for £32. That was in November last year and no complaint had been received until the end of April this year; in fact, defendant had written and expressed his appreciation of the set. If the set was properly operated it worked entirely satisfactorily.

WALTER HUME, employed by the plaintiff, said that he had tested the set and found it satisfactory. The witness agreed with the defendant's counsel that the set should be capable of receiving from all the British broadcasting stations. The plaintiff said that he had received no complaints about this kind of set apart from that of Mr. Plum.

His HONOUR gave judgment for the plaintiff for the amount claimed and costs, and for the defendant on the counterclaim for £16 and costs.

P. D. Mitchell, Ltd., v. British Insulated & Helsby Cables, Ltd.

THIS action came before Lord Morison in the Scottish Courts recently. The plaintiffs, metallic cask makers and oil refiners, claimed the sum of £2,800 as damages for breach of contract in respect of the supply of electric welding machines, while the defendants counterclaimed for the cost of goods supplied. The plaintiffs stated that they received from the Helsby Company a spot welder, a seam welder, two circumferential welders and some jigs. They complained that these machines did not operate satisfactorily, but the suppliers replied that the plant was quite suitable for the work if it was properly handled. His Lordship held in favour of the plaintiffs, but considered the amount of their claim extravagant. He awarded them £550 as damages for breach of contract and "assoilzied" them from the conclusions of the summons in the counterclaim. In giving judgment, his LORDSHIP said that the contract between the parties implied a warranty that the machines would efficiently weld the seams of the drums made by the plaintiffs and permit of an output of 2,000 per week. The thickness of the material employed was, however, beyond the capabilities of the machines and their efficiency was impaired by overheating. He considered that Messrs. Mitchell were entitled to reject the machines as they did not fulfil the conditions of the contract.

Gas Engines and Electricity Supply.

Some Views on the Power Supply Question.

ONE of the papers read at the annual meeting of the Institution of Gas Engineers in London on Thursday, June 11th, was by Sir Dugald Clerk, F.R.S., and it dealt with gas for motive power. One of the purposes of the paper was to show that it was possible for the gas industry to capture a large quantity of business from the electricity supply industry by inducing manufacturers to install gas engines upon their premises to generate electricity, in preference to taking supply from the public mains, the contention being that it was cheaper in many cases to do so when the average price paid for lighting and power was taken into account. Sir Dugald Clerk, who is well known, of course, as a director of the National Gas Engine Co., stated that electric light and power companies were pressing hard to supply motive power, and a certain field would doubtless always be theirs. For powers up to 5 or 6 h.p., occasionally used, no doubt they would find a considerable field; but if equal pressure were applied by gas companies, in conjunction with gas-engine manufacturers, he was convinced that the electricity companies would be prevented from seriously invading the field of larger powers. Even the very small gas power trade might be held against the electricity companies if gas companies would combine to let out gas engines on hire in the same way as they so commonly dealt with gas stoves. The electricity supply companies adopted similar methods; and there seemed to be no good reasons why the gas companies should not fix gas engines in the same way as the Tyneside Electric Supply Company, in Newcastle, fixed motors—either on simple hire or else on the five years' purchase system.

In the discussion, Mr. P. D. WALMSLEY (Great Yarmouth), after agreeing that in many industries, such as weaving and textile industries, electricity was essential owing to the advantages which followed from the use of motors on individual machines, urged the necessity for concentrating upon a consideration of the cost of generating electricity in such factories by means of gas engines. Whereas the average cost of generating electricity throughout the country was about 1.9d. per unit, there were many instances in which energy was being sold for 1½d. per unit for power purposes. In such cases he recommended gas engineers to inquire from these power users the average price they were paying for lighting and power, because it would more often than not be found that, in view of the high price charged for electricity for lighting purposes, it would pay these manufacturers to put down their own gas-engine-driven electricity generating plant.

Mr. S. SHADBOLT (South Bank, Yorks.), said the paper emphasised the absurdity of the methods adopted by the electricity supply industry in charging for electricity. On the North-East coast there were super-power stations interlinked with distribution systems which, he ventured to think, were a great deal more to be feared by the gas industry than anything the Government was likely to promote. Electricity supply undertakings were fleecing the lighting consumers in order to undercut the price to get the power load. At the same time it must be remembered that it was not always a question of cost which determined the use of gas or electricity; he was constantly finding that the convenience and adaptability of the electric motor played an important part.

Dr. E. W. SMITH (Woodall-Duckham Co.), urged gas engineers not to assume that the electricity supply industry was not moral because it adopted the methods of charging which it did. It was time that the gas industry started an inquiry to consider the best commercial methods of selling gas. Personally, he was quite sure that a very good case could be made out for selling gas for power purposes at cheaper rates than it was supplied at for lighting purposes.

The PRESIDENT pointed out that under their Acts of Parliament gas companies were prevented from making a reduction of more than 25 per cent. in the price charged the industrial consumer as compared with domestic consumers.

SIR DUGALD CLERK, replying to this part of the discussion, agreed that separate electric motors were frequently an enormous convenience, so much so that the National Gas Engine Co. used them, although it generated the electricity itself by means of gas engines. He agreed with Mr. Shadbolt that it was a pity that lighting consumers should be penalised by the electricity supply industry for the sake of the power consumers, and that it would be better if that could be avoided. At the same time as had been indicated by Dr. Smith, if some inquiry could be instituted into the division of the costs of manufacture in the gas industry, it would be possible to charge much lower prices for gas for power purposes than for domestic purposes.

"Wireless" Transmission of Energy.—According to one of our Italian contemporaries some interesting experiments have lately been carried out in Milan by Signor Narciso Midali in connection with the "wireless" transmission of electrical energy, when a receiving station succeeded in picking up 50 per cent. of the power transmitted. Signor Midali is continuing his experimental work.

Reviews.

The Law Relating to Public Service Undertakings. By F. N. Keen, Ll.B., Barrister-at-Law. Pp. xii + 320. London: P. S. King & Son, Ltd. 1925. Price, 15s. net.

This book is one of the monographs published in connection with the London School of Economics, and is based on a course of lectures delivered there by the author.

The "public service undertakings" specially considered include: Water, gas and electricity supply, land drainage and irrigation, markets and fairs, and hydraulic power. Transport services are excluded, the author thinking that their special features are best dealt with separately.

The characteristic of "public service undertakings" which interests the author is: "that the undertaking has such a degree of importance or involves such difficulties in execution as to justify the placing of those who undertake it in a position of special privilege within the community or the conferring of special powers upon them."

As these special privileges and powers mean generally that the "undertakers" are permitted to do things otherwise illegal, to interfere with the general rights of property within certain limits of locality and time, they are given some kind of monopoly rights in return for the assumption of some duties and obligations towards the community within their field of action; for the benefit of that community the undertakings have to be established and conducted under special laws, in respect of which there has developed a code of procedure, general principles, and precedents, partly statutory, partly administrative, partly judicial, and partly regulated, *e.g.*, by the Standing Orders of the two Houses of Parliament, differing in some respects for each class of undertaking, of which it is necessary for those who wish to engage in such undertakings, and those who have to administer them, to have a general knowledge. The imparting of this general knowledge with the addition of the more important detail conditions, is the author's object. It is an object which he can be congratulated upon having achieved to a satisfactory and useful degree.

The first eight chapters cover subjects of general application, the general code of procedure and principles obtaining in this country, under the headings, "A Preliminary View" (including the methods of obtaining the legal powers for the establishment, and the general scope of the regulations accompanying the powers, of the undertakings); "The Scope of Purposes and Powers," "Land Works, and Compensation," "Duties and Obligations," "Capital and Revenue," "Rating and Income Tax" and "Sale, Lease, Winding-up and other matters."

The third of these chapters deals very clearly with the provisions under which public service undertakings are permitted to take land by compulsory process, and in various other ways to invade the general rights of property. It gives a concise account of the procedure, from the first stage of notices, &c., up to the various methods of determining the compensation to be made to the parties whose properties and/or amenities and interests are taken or affected; and the legal principles upon which compensation is assessed. The chapter is mainly an exposition of the provisions of the Lands Clauses Acts, 1845 to 1895; the variations of these provisions as incorporated in, or applied to, special Acts of various kinds; and the constructions of the Acts established by decisions of the Courts. This is a very useful and informative exposition of an intricate matter of the first importance.

The eight general chapters give a good bird's-eye view of the position of public service undertakings before the law; the manner in which Parliament has ordained that they may be established; the general principles governing their privileges, powers, duties, obligations and rights; with illustrations of the way in which the Courts have applied these principles and construed particular provisions.

The remaining six chapters are devoted each to one of the particular classes of undertakings above mentioned. The relevant general Acts and Clauses Acts are summarised; the procedure for obtaining powers indicated and a general view given of the scope and character of the particular powers granted and the corresponding duties and obligations.

It is significant that by far the longest of the six chapters is that referring to electricity supply. Although the youngest of the industries dealt with, it operates in a tangle of legislation more involved than that regulating any of the others. As this is the subject of chief interest to the readers of the Electrical Review, it has been read with particular care. There is very little to criticise. It is a clear and full statement of the general legislation, with a sufficient reference to the nature and scope of variations in special cases for which there are precedents. The general effects of the more recent Acts, of 1919 and 1922, are set out as fully as can be expected, considering that the concrete results of those Acts are still very much in embryo, which is a good reason for cautious treatment by a lawyer. The two London Acts of 1908 and 1910 are not mentioned, but the author probably thought these of purely local interest.

Quite logically the author mentions in his descriptions of specific provisions of the various Acts, the alterations by repeal, amendment, and substitution, made by later Acts; but in describing the later Acts usually passes over the amending and repealing provisions in silence. This is a little inconvenience to the use of the book for reference. One definite omission of reference to an amendment is that of the date to which annual accounts are to be made up in Section 9 of the E.L. Act, 1882.

The summary of the Clauses Act of 1899 is particularly useful. That Act has always seemed to the reviewer an extraordinary difficult one to memorise and to find one's way in. The author's summary is quite helpful, and it is an important Act to everyone responsible for the conduct of electricity supply.

The Section defining the supply powers of a power company (pp. 253-254), if correctly quoted from any Act, is unusual in permitting a power company's consumer within the area of supply of an authorised distributor, to use as much energy for lighting as for power. Generally the lighting proportion is limited to 20 per cent. of the total supply.

The general style is clear and easy to read, but would have been improved by eliminating the occasional personal form of address ("you will remember," "you will see," &c.), derived from its original lecture form.

The book is a very useful one, remarkably free from divagations into legal and procedure technicalities, and consequently of the greater value to the layman who wants guidance in the general matters of promotion and conduct of undertakings which are necessarily outside the general law in certain respects.

Circuit Troubles and Testing. By Terrell Croft. Pp. x + 224; figs. 237. London: McGraw-Hill Publishing Co., Ltd. Price, 12s. 6d. net.

Probably we should all welcome the wireman or fitter, &c., who could produce a fault-proof installation, but our ideal must be one who after getting as near to the fault-proof installation as possible, will be able to locate with accuracy and speed and repair effectively the fault when it does arise. The book should prove of great value to all employed on the installation of any class of electrical equipment and will no doubt be welcomed by many electrical workers of all grades. The book commences with descriptions of many of the simpler testing devices leading up to the more advanced instruments and their application in many methods of testing and fault localising on distribution systems, including both overhead and underground cables, and installations of all descriptions.

The author forcibly draws attention to the necessary application of different tests to different classes of cables and installations. The Wheatstone-Bridge and Slide-Wire tests, and modifications of both, are extensively dealt with, while the simpler galvanometer and various fall of potential tests are dealt with in their respective cases. The author deals very briefly with the question of faults on motors; this is rather a pity, because the practical man's need for advice in connection with fault locating is probably more acute in the case of faults on motor windings, or machines of that family, than in the case of ordinary installation wiring faults, in virtue of the apparently complex character of such faults and their inaccessibility.

Some miscellaneous factory tests such as the testing of porcelain insulators, &c., add to the general interest of the book.

Theoretical and Applied Electrochemistry. By Maurice de Kay Thompson, Associate Professor of Electrochemistry in the Massachusetts Institute of Technology. Revised Edition. Pp. xviii + 551; figs. 218. New York and London: The Macmillan Co., 1925. Price, 20s. net.

The object of this volume is to give an account of the most important electrochemical industries, together with the principal applications of electrochemistry. The book is an important manual on the subject, the technique described being of a very high order. The great strides within recent years which have been made in this domain of chemistry, make the appearance of this volume timely and opportune. The present edition of this valuable work has been completely revised; a section on the theoretical aspects of the subject is added, Le Blanc's "Lehrbuch der Elektrochemie (1922)," and Foerster's "Elektrochemie wässeriger Lösungen (1922)," having been largely drawn upon.

The subject matter is divided into three parts; the first is "Theoretical," dealing with Faraday's laws, electrolytical dissociation, ionic theories, electro-osmosis and polarisation. The second part contains an account of the "Applied Electrochemistry of Aqueous Solutions," dealing with the construction of electrolytic cells, electroplating, the electrolytic extraction and refining of metals, electrolytic oxidation and reduction, and the construction and uses of storage cells. The third part deals with "Electric Furnaces and their Products," comprising sections on the products of resistance and arc furnaces, electrothermic reduction processes, fixation of atmospheric nitrogen and the production of ozone.

The electrochemical industries are of great and widespread importance, not only by reason of the capital involved, and the numbers to which they give employment, directly and indirectly, but also for the important part they have played in the development of various countries. They have of necessity called forth an abundant technical literature provided by experts of acknowledged eminence, all urging the desirability of extending the applications of electrochemistry. The contribution of the author in this volume, is a discussion of the subject from the theoretical and technical point of view separately, and the general industrial applications of electrochemistry. Throughout the whole work the industrial applications are kept in the foreground, and the chain of theory serves to link the indus-

trial processes into one coherent whole, giving a well informed survey of the subject. The treatment of the generalised theory is excellent; a great deal of scattered work is here brought together, and welded into a logical development. The volume shows a wide practical knowledge, and persistent endeavour to bring together the knowledge of the scientist and the skill of the industrialist, to give practical application to theoretical principles and new discoveries. In a science of such recent and rapid growth as electrochemistry, the methods of presentation are not so stereotyped as in the older sciences, and vary considerably with different authors; but this volume will serve as a model for future writers on the subject.

The volume under review is never tedious; the author's statements are always strictly relevant; they keep each subject well in view, and thus retain the reader's interest. The general excellence of the book is worthy of great praise, being a genuine attempt to elucidate the broad principles of the subject in the light of our present knowledge, and invaluable from the point of view of suggestive matter. The volume can be warmly recommended, particularly to those who, from the fact that the first edition has been out of print for some time, may be unacquainted with the merits of what may be still regarded as one of the standard treatises on the subject.

The book is far from being a mere compilation, for it is evident that the author has a first hand knowledge of the subject and also has devoted considerable energy and zeal to the undertaking. The description of processes are clear and concise, and are well illustrated with diagrams and sketches of the different types of plant employed.

The Elements of Railway Economics. By Sir WILLIAM M. ACWORTH, K.C.S.I., M.A. New edition revised and enlarged by the author and W. T. STEPHENSON, B.A. Pp. 216. London: Oxford University Press. Price 3s. 6d. net.

It is an uncommon and rather sad experience to have to review a book coincidently with the announcement of the death of the author. Sir William Acworth had attained a professional reputation maintained by untiring useful activities up to a ripe age, placing him among the worthily fortunate of his time.

The book is a new edition of a work already well known and esteemed, revised with the assistance of Mr. W. T. Stephenson, and brought up to date with respect to the changes in British railway organisation since the war, and the Railway Act of 1921. It is in these respects a new book, one which is indispensable to the student of the important subject matter, and to traders and others who need some knowledge of the underlying principles of railway charges and cognate matters. Its moderate price is a rare virtue nowadays.

Taking a broad view, the book is an explanation of the way in which railway charges are determined, with a short historical sketch from the early days of canals. It takes the standpoint that a "cost of service" basis is inapplicable, with the consequence that "what the traffic will bear" or "value of service rendered" principles have to be applied, with, however, numerous modifications due to, *e.g.*, the existence of competing transport agencies, special circumstances of individual trades and traders.

The author prefers "what the railways can bear" to "what the traffic can bear"; *i.e.*, the minimum rates which the railway can accept as reasonably remunerative, rather than the maximum which can be tolerated by the parties served. The substitution has a better face value. The older phrase has a somewhat predatory tone, which the author endeavours to prove unjust, with some success.

The principal argument against a "cost of service" basis is that it is impossible to separate from the costs and charges of a railway, the true cost of any particular class of traffic. This argument is supported by a number of sample railway revenue accounts, British and American. These differ in the amount of detail, the American forms being the fuller. They justify the author's contention that from the accounts of a single accounting period it is not practicable to allocate costs and charges to specific classes of traffic completely.

This argument seems to be open to two criticisms; first, that the forms and details of the accounts might be altered to give more information; secondly, that even with the accounts as they are, some information can be gleaned by the comparison of costs over different periods with different proportions of various classes of traffic.

The author's phrase "what the railway can bear" implies some evaluation of costs, for clearly the railway cannot "bear" rates of charge which do not cover costs and provide some return upon capital. Again, it is shown by numerous instances that different classes of goods carried entail specific costs which are allocatable. A railway cannot in reason make identical charges for carrying ten tons of coal, and ten tons of chilled beef, or ten tons of straw hats or furniture, the same distance. The ton-mile basis of charge is not commercially practicable as between different classes of goods; as between goods and passengers it is hardly more absurd.

The real difficulty of the "cost of service" basis seems to be the very large proportion of total costs and charges of a railway which have to be met independently of the amount of traffic, or the proportions of different classes of traffic handled; and—in a lesser degree—the difficulty of finding a common denominator for the services rendered. The reviewer is not convinced, however, that the costs and charges not definitely allocated might not be reduced to more manageable proportions by the application of "cost accountancy" methods. The obvious process is to allocate the specific costs of each class of traffic. When this is done to the fullest practicable extent it may appear that the non-allocatable portion is not so great as is now assumed.

The Railway Rates Tribunal set up by the Railway Act has to see that rates and fares as a whole are so adjusted that the railways can, with economical and efficient management, earn a sum equal to the net revenue earned in 1913, plus an allowance for interest on additional capital expenditure, and 20 per cent. of any economies effected—80 per cent. of the economies going to traders by way of reduction of rates. It also has to consider individual "exceptional rates and fares", and individual complaints as to rates. It may at some time have to distribute increases or decreases of costs among the various classes.

It is difficult to see how these functions can be carried out equitably without inquiry into costs and their allocation; so the legislature has laid upon the Tribunal a task which can only be accomplished by a process which the author thought hardly possible. The necessity may evolve the methods.

The book is written in an admirably lucid style, and cannot fail to interest and inform the careful reader. Whether agreeing or not with all its conclusions, the reader will thank the author for a clear exposition of an intricate subject, and regret that his great store of knowledge and capacity for applying .. is no longer at the service of the community.

In Mr. Stephenson, one ventures to hope, he has a capable successor.

The History of the Telephone in the United Kingdom. By F. G. C. BALDWIN, M.I.E.E. Foreword by F. GILL, O.B.E., M.Inst.C.E., M.I.E.E. Pp. xxvi + 728. Figs. 186. London: Chapman & Hall, Ltd. Price, 42s. net.

It is a long cry from "Mr. Graham Bell" of 1876 to the "Dr. Graham Bell, LL.D., Ph.D., D.Sc., M.D.," of 1922, the year of his death: yet the long interval between those dates represents the birth and growth of telephony in this country; and the distinctions added to the name indicate the importance of the practical application of electricity in the transmission of speech made by this great pioneer in what has become an indispensable necessity in our social and industrial life. Looking back over this long interval of years the writer can remember the intense excitement of listening to speech, badly cut up by inductive disturbances in those early days, and in comparing it mentally with a recent experience when he listened on a line equivalent in length to the distance between New York and San Francisco to flawless conversation carried on without any more noticeable diminution of intensity than if it had been received from a speaker a few miles distant!

In this exhaustive work of Mr. Baldwin's we have the records of those brilliant achievements, both in individual effort and organised industry, that have contributed to the attainment of the wonderful efficiency of our telephonic system of to-day.

A good deal of space is given in the earlier part of the book to the litigation between the Post Office and the telephone companies in connection with infringements of the rights of the P.M.G., and to the early disputes in connection with the infringements of patents held by the United Telephone Company.

The first three chapters may be taken as presenting the advances in telephony in a sequent order; but from this point onwards the author departs from the method in order to give prominence to the commercial and technical aspects of the subject as these develop. One chapter is wholly devoted to the legislation which, as the author truly says, has exercised such an important influence on the development of telephony in this country.

It is not possible in a review, such as this, to make more than a general reference to those chapters dealing with the methods of switching, and to the associated appliances which have been evolved to meet the progressive requirements; it will be sufficient to say that nothing essential has been omitted in tracing the growth of the organism up to the highly complex form in which, as represented by automatic telephony, we find it to-day.

In addition to its great utility as a work of reference for those interested in the historical development of telephony, the book has a readableness which one would not expect to find in a volume of this description, and the author is to be congratulated on this embodiment of what must have been a long and laborious task.

The work appears to be free from any typographical or other errors, but on page 649 it is stated that a transmitter of the condenser type "consists of two discs arranged in the *same* plane, one rigid the other of steel which serves as a diaphragm, and is free to vibrate in *front* of the other"—a statement which is not quite in accordance with Euclidean geometry!

Electrical Terms in the French Language.—In November last the Academie Française declined to admit to the standard dictionary as French words, the terms "Electrification" (noun) and "Electrifier" (verb). As a result, however, of the protests of the French electrical press against the decision, the Academie has, we learn, agreed to consider the matter.

Business Notes.

Commercial and Industrial Developments, Business Changes, Trade Opportunities, New Publicity Literature, Liquidations and Failures.

The Yorkshire Agricultural Show.—A notable feature of the Yorkshire Agricultural Show, held at Bradford from July 22nd to 24th, was the considerable number of exhibits of farm, garden and domestic machinery and appliances driven by electric power. Displays of household electrical fittings were made by Messrs. Taylor & Parsons, Ltd., Bradford; Messrs. C. W. Lillie, Leeds; Messrs. Smith & Hardcastle, Bradford; and Messrs. Henry Wilson, Ltd., Bradford and Birmingham. Radio equipment was exhibited and demonstrated by Messrs. Taylor & Parsons and Messrs. E. Farnell & Sons, Birkenshaw, Bradford.

A Westinghouse-Siemens-Schuckert Agreement.—It is reported from Berlin that an agreement to run for ten years has been lately effected between the Siemens-Schuckert Werke Gesellschaft and the Westinghouse Electric and Manufacturing Co., Pittsburgh, U.S.A., for an interchange of technical and production methods and for the use by either company of any patents belonging to either of the concerns. The agreement applies purely to technical matters and in no way affects either concern from a commercial point of view.

Electric Transport at Wembley.—In addition to having one of their vans working in the Exhibition grounds, Messrs. Walker Vehicles, Ltd., are now opening a stand in the Palace of Housing and Transport at Wembley and exhibiting the "Walker-Electric" balance drive axle. They are further showing photographs illustrating some of their vans operating in this country.

Safeguarding of Industry.—At a largely attended meeting of Birmingham and Midland manufacturers at the Queen's Hotel, Birmingham, at which many trade organisations were represented, a resolution, proposed by Mr P. J. Hannon, M.P., and seconded by Sir Herbert Austin (Austin Motor Co.), was carried, calling upon the Government to take immediate steps to bring into operation its promises to afford relief to depressed British industries. This resolution was not, it was explained, an attack upon the Government; it was to give expression to the general feeling of disappointment in the minds of the manufacturing and business community that the present Government had not undertaken its obligations, as made in election promises, as rapidly and effectively as everybody expected. The points that were voiced by Mr. George Terrell (President of the National Union of Manufacturers), who presided, and in the discussion, were that the present unsatisfactory state of industry was due to unfair competition from abroad, and the high cost of production at home. It was stated by Mr. Hannon that before long there would be a great national movement, inaugurated on behalf of manufacturers and traders generally, with the object of proclaiming that the only remedy for depressed British industries was a careful system of protection. Resolutions were passed insisting that any industry which came under the Trade Boards Act should be deemed to come within the definition of a substantial industry under the Safeguarding of Industries Act; and that, in the event of an industry being granted protection under the Safeguarding of Industries Act, any duty imposed should be effective from the date of application.

Trade Announcements.—Messrs. Vickers, Ltd., have now acquired the whole interest in the Vickers-Spearing Boiler Co. Mr. A. H. Spearing has resigned his position as managing director, and is no longer connected with the company. The company will be carried on under the name of Vickers-Spearing Boiler Co., Ltd., as before. This change also gives Messrs. Vickers, Ltd., the control of Messrs. Tinkers, Ltd., Daisyfield Boiler Works, Hyde, near Manchester.

The name of the business of "S. E. Hunt," 272, Brighton Road, South Croydon, has been changed to Kingsdown Electrical Company. The proprietor, Mr. F. Pritchard, A.M.I.E.E., was, until January last, when he took over the business, proprietor of the Rugby Electrical Engineering Co.

Mr. E. S. Mackrill, late of the firm of E. T. Mackrill and Sons, electrical and general engineers, of 16, Kingsbury Square, Aylesbury, has purchased the stock-in-trade, together with the whole of the machinery and plant of the firm, and will continue to trade as an electrical engineer and contractor.

Messrs. Philips Lamps, Ltd., have opened a branch at 4, Park Place, Leeds, with Mr. E. H. Armitage as manager. Telephone: "Leeds 28,339."

Catalogues and Lists.—The Relay Automatic Telephone Co., Ltd., Marconi House, Strand, W.C.2.—An illustrated brochure outlining the "Relay" system of automatic telephony, and giving examples of large buildings in which private exchanges have been installed.

British Central Electrical Co., Ltd., 6 and 8, Rosebery Avenue, E.C.1.—Illustrated and price pamphlets dealing with "Koh-i-Noor" adhesive tape, various patterns of ventilating fans, a shock-proof hand-lamp, a three-pin handshield plug, and a violet-ray outfit.

Siemens & English Electric Lamp Co., Ltd., 38 and 39, Upper Thames Street, E.C.4.—Catalogue Z103, containing details and prices of house service switch- and fuse-gear, watertight switches and fuses, and knife switches.

British Insulated & Helsby Cables, Ltd., Prescot, Lancs.—Catalogue P191, illustrating and describing "Prescot" lead joint boxes.

Messrs. J. A. Crabtree & Co., Ltd., Lincoln Works, Walsall.—A pamphlet, illustrated in colour, advertising "Crabtree" quick-make-and-break tumbler switches.

The British Thomson-Houston Co., Ltd., Crown House, Aldwych, W.C.2.—A fully detailed and priced pamphlet dealing with a number of "B.T.-H." radio valves.

Messrs. Negretti & Zambra, 38, Holborn Viaduct, E.C.1.—An illustrated and priced catalogue of thermometers, tachometers, pressure gauges, hygrometers, and other instruments for industrial use.

The London Electric Wire Co. & Smiths, Ltd., 7, Playhouse Yard, Golden Lane, E.C.1.—A net trade price list of wires for radio work—aerials, telephone cords, enamelled, &c.

Mr. Alan Wright, Sentinel House, Southampton Row, W.C.1.—Two illustrated and priced folders, dealing respectively with the "Inventum" electric hot-water tap and the "Inventum" electric cistern.

Shell-Mex, Ltd., Shell Corner, Kingsway, W.C.2.—A handbook dealing with fuel and lubricating oils for heavy-oil engines.

The Brush Electrical Engineering Co., Ltd., Falcon Works, Loughborough.—Publication No. 1,005, containing details of a trial of a 5,000-kW Brush-Ljungström turbo-generator installed at Wallasey.

Messrs. Cecil Hodges & Co., Ltd., Empire Works, Dalston, E.8.—An illustrated and priced catalogue of windmills for generating electricity, &c. (Vereecke patents).

The Electrical Equipment & Carbon Co., Ltd., Bank Buildings, 109-111, New Oxford Street, W.C.1.—An illustrated pamphlet advertising the "Sonora" loud speaker for which the company holds the sole agency for this country.

Bankruptcy Proceedings.—F. W. Caseley, 5, Hepworth Arcade, Hull (trading as the Radiograph Company), radio engineer.—The public examination of this debtor was held recently at the Guildhall, Hull. Debtor attributed his failure to the illness of his wife, loss on the sale of bad quality radio goods supplied by a creditor, and bad trade. He stated that instead of returning the bad quality goods that were supplied to him, he kept them in stock. The examination was closed.

H. A. Sanders, Black Cat Restaurant, Chawston, Beds., electrical contractor, &c.—The public examination of this debtor was held on July 21st at the Shire Hall, Bedford. According to the statement of affairs, there were liabilities amounting to £2,326, and assets of £361, leaving a deficiency of £1,965. Debtor attributed his failure to the failure of certain businesses and limited companies in which he had been interested. He stated that he joined another person at Burnham-on-Sea to carry on business as electrical engineers. He first put £360 into the concern. After two years the business was formed into a limited company with a nominal capital of £5,000. The debtor was allotted 500 £1 shares and was appointed managing director at £5 per week. On the formation of this company and for its business purposes he obtained an overdraft from his bankers up to about £1,000, which was guaranteed by the present petitioning creditor. About 18 months ago the company was wound up. The debtor was a creditor of the company, and it was expected that about £10 would come to his estate. When he went to Chawston he had about £40 in cash. The object of acquiring the land was to start a petro-filling station, an electrical business, and a restaurant. The examination was adjourned. Mr. H. Ball, Duke Street, Bedford, was appointed trustee on July 17th.

J. Humphries, the yard behind the Plough Inn, Oldham Road, Rochdale, plumber and electrical engineer.—The public examination of this debtor was held on July 24th at the County Police Court, Rochdale. According to the statement of affairs, there were liabilities of £597 and assets of £276, leaving a deficiency of £321. Debtor attributed his failure to lack of capital, trade depression, and lack of commercial knowledge. He stated that he started on his own account as a plumber and electrical engineer in 1922 with £20 capital, which represented the proceeds of the sale of his furniture to his wife. At the end of 1922 he was joined by a partner with £30 capital, but in 1924 this partnership was dissolved, and debtor took over all the liabilities and assets, although he was aware of the financial position of the business. In February of this year he paid a deposit of £55 on the purchase of a house and shop for £550, but was unable to complete the purchase, and had to forfeit the deposit. The examination was closed.

G. W. Tempest (Northern Radio Co. and General Wireless Trading Co.), radio and telephone engineer, 40, Brazennose Street, and Arcade Chambers, Manchester, and Commercial Street, Leeds.—First meeting, August 5th, at the Official Receiver's office, Byrom Street, Manchester; public examination, September 18th, at the Court House, Manchester.

A. T. K. MOIR, trading as Moir & Watts, Weardale Road, Lee, Kent, electrical and mechanical engineer.—The public examination of this debtor was held on July 21st at the Court House, Greenwich. Debtor attributed his failure to recent inability, through illness, to exercise proper supervision over the business, lack of capital, depreciation of stock, and keen competition. He stated that his stock depreciated in 1924, and his trading loss was about £1,200. The examination was adjourned.

W. K. M. WILSON, 1, Mount Street, Heanor, Derbyshire, electrician and radio apparatus dealer.—The first meeting of creditors was held on July 23rd at the Official Receiver's offices, Nottingham. The statement of affairs showed ranking liabilities of £373 and there was a deficiency of £355. Debtor attributed his failure to the slump in trade, keen competition, and inferior goods supplied by a creditor, which had damaged his reputation. The matter was left with the Official Receiver as trustee of the estate.

M. D. ROSENBLOOM, trading as D. Rose & Co., dealer in electric lamps, 25, Osborn Street, E.—This debtor again attended on July 21st before Mr. Registrar Mellor, at the London Bankruptcy Court, for public examination on accounts showing liabilities of £2,293, against assets valued at £757. The examination had stood adjourned for the debtor to furnish cash and goods accounts. He was questioned in detail upon the accounts and the examination was ordered to be concluded.

H. M. MURAD (W. H. Murad & Co.), wireless manufacturer, 126, Princess Street, Manchester.—Last day for proofs for dividend, August 8th. Trustee, Mr. J. G. Grant, Official Receiver, Byrom Street, Manchester.

F. S. BOWEN (Manchester Electrical Maintenance Co. and F. Bowen & Co.), electrical engineer, 7, Brazennose Street, and 43, Thomas Street, Manchester.—Second and final dividend of 1s. 1 9/10d. in the £, payable August 10th, at 21, Spring Gardens, Manchester.

W. A. A. C. ROBINSON, electrical engineer, 10, Carnaby Street, Golden Square, W.—Receiving order made July 16th, on creditor's petition. First meeting, August 5th; public examination, September 1st, both at Carey Street, W.C.

R. A. BURNELL, electrical engineer, Harefield Park, Harefield, Uxbridge.—First meeting held on July 29th, at 29, Russell Square, W.C.1. Public examination, July 31st, at the Town Hall, Windsor.

J. E. LOCKING, dealer in cycles and wireless goods, 14, Fish Street, Kingston-upon-Hull.—Last day for proofs for dividend, August 5th. Trustee, Mr. J. E. D. Stickney, Official Receiver, 37, Scale Lane, Hull.

Company Liquidations.—CUTTING & MUIR, LTD., electrical engineers, St. Matthews Street, Ipswich.—A meeting of the creditors of the above was held recently at Ipswich. A statement of affairs was submitted, showing the position as at June 29th, prepared by the liquidator, Mr. Chas. G. Hines, accountant, of 4, Museum Street, Ipswich. This disclosed liabilities of £1,335, all of which was due to the trade. The assets totalled £875, but from this had to be deducted £42 for preferential claims, leaving net assets of £833, or a deficiency as regarded the creditors of £502. It was reported that the business was originally commenced as a partnership concern on June 1st, 1919. It was, however, subsequently sold to the limited company, which was registered in 1920, with a nominal capital of £5,000. There had been issued 3,500 shares, all of which, it was understood, were paid for in cash, with the exception of those issued in respect of the purchase consideration. Trading figures were submitted which showed that the total trading losses had been £3,372, which practically accounted for the whole of the capital of the company. It was decided to confirm the voluntary liquidation of the company, subject to Mr. Osborne being joined as co-liquidator with Mr. Hines, the shareholders' nominee. It was also resolved that the liquidators should enter into negotiations forthwith for the disposal of the business as a going concern. A committee was appointed consisting of representatives of the General Electric Co., Ltd., Callender's Cable & Construction Co., Ltd., and the Metropolitan-Vickers Electrical Co., Ltd.

The following are the principal creditors :—

	£		£
A. R. Motor Accessories	21	Callender's Cable & Construction Co., Ltd.	228
Bennett & Snare, Ltd.	36	Falk, Stadelmann & Co., Ltd.	24
British Thomson-Houston Co., Ltd.	87	General Electric Co., Ltd. ...	359
Canham, F. W., & Sons	14	Metropolitan-Vickers Electrical Co., Ltd.	262
Chloride Electrical Storage Co., Ltd.	27	Ruston & Hornsby, Ltd.	50

HENRY JOSEPH & CO., LTD., 96, Victoria Street, London, S.W., electrical engineers.—At a recent meeting of the creditors the chair was occupied by Mr. Norman Bell, C.A., the liquidator in the voluntary liquidation. It was stated that the shareholders had previously passed the usual resolution for voluntary liquidation, and had appointed Mr. Bell, of 26-27, Bush Lane, E.C., to act as liquidator. A statement of affairs was submitted, disclosing liabilities of £4,091, and total assets of £4,196, from which had to be deducted £87 for preferential claims and £2,947 in respect of debentures and interest, leaving net assets of £1,162, or a deficiency as regarded the creditors of £2,929. Mr. Bell reported that at the date of his appointment a receiver was in possession for the debenture-holders. The Receiver, Mr. R. G. Sidford, of 36, Southampton Street, Strand, W.C., was appointed under the debenture deed as from June 18th last. He (Mr. Bell) understood that the receiver had previously been the auditor of the company, and it had been the intention of the shareholders to appoint that gentleman as liquidator. The principal creditors were Messrs. W. & T. Loch, of Bath, and they were consulted. They expressed the opinion that an independent liquidator should be appointed to represent the trade, and his (the chairman's) name was put forward. He added that the company was registered on July 27th, 1923, to take over as a going concern a business which had previously been carried on under the style of Henry Joseph & Co. No resolutions were passed by the creditors, and consequently the voluntary liquidation will be continued with Mr. Bell as liquidator. The principal creditors are :—

	£		£
Loch, W. & T.	1,090	Bankers	615
Meyer, L.	709	Vesshoff, H.	312

WIRELESS VALVES, LTD., 86, Rosebery Avenue, London, E.C.1.—A meeting of creditors was called for July 27th at the offices of the company. Resolutions for voluntary liquidation had previously been passed, and Mr. G. F. Marreco, the managing director of the company, was appointed as the liquidator. No creditors attended the meeting, and it is stated that all the liabilities have been discharged. The voluntary liquidation of the company will therefore be continued with Mr. Marreco as the liquidator.

BRITISH PORTABLE RADIO, LTD.—Winding up voluntarily. Liquidator, Mr. W. E. Bundy, 31, Bedford Row, E.C. Meeting of creditors at 31, Bedford Row, August 1st.

RADIOPHONES, LTD.—Winding up voluntarily. Liquidator, Mr. H. Lever, Chiswell House, Finsbury Pavement, E.C. A meeting of creditors was called for July 24th, at the offices of the liquidator. Particulars of claims to be sent to the liquidator by July 31st.

LEAD HYDRATE & BATTERY CO., LTD.—Winding up voluntarily. Liquidator, Mr. P. B. Nevill, 94, Old Broad Street, E.C. Meeting of creditors, August 4th, at the liquidator's offices; particulars of claims to the liquidator by August 14th.

W. R. THORNTON & SON, LTD.—A meeting of creditors was called for July 27th at the Duke of Edinburgh Hotel, Abbey Road, Barrow-in-Furness. Liquidator, Mr. W. H. Hole, 105, Duke Street, Barrow-in-Furness.

RODERICK ELECTRIC SUPPLIES CO., LTD.—Winding up voluntarily. Liquidator, Mr. W. H. Cork, 19, Eastcheap, E.C.

INTERNATIONAL RADIO MANUFACTURERS, LTD.—Winding up voluntarily. Liquidator, Mr. P. B. Nevill, 94, Old Broad Street, E.C. Meeting of creditors, August 4th at the liquidator's offices.

INGLEBY & CO., LTD.—Winding up voluntarily. Liquidator, Mr. R. E. Starkie, 6, South Parade, Leeds. Meeting of creditors at the Hotel Metropole, Leeds, July 30th.

LELIOS LAMP CO., LTD.—A meeting of creditors was called for to-day at 58, Southwark Street, S.E. Liquidator, Mr. E. L. Butler. (This notice is purely formal; all creditors have been or will be paid in full.)

GAS AND ELECTRIC SECURITIES, LTD.—Winding up order made by the High Court on July 21st.

Composition Annulled.—At Bolton County Court, on July 23rd, the Official Receiver applied for the annulment of an order approving a composition submitted by W. T. Smith, electrical and mechanical engineer, Bolton, and acceded to by his creditors. The receiving order was made in January, 1918, and in November, 1919, debtor's proposal to pay a composition of 5s. in the £ was accepted. Debtor paid the first instalment but no more. The arrangement was that amounts of 1s. 8d. should be paid five months later and again ten months later. Debtor had paid £336; he was four years behind time. The debtor explained that the moneys he had received had been taken up in perfecting an invention. The judge said that creditors must come first, and annulled the composition and adjudicated debtor bankrupt; the order would not operate if in three months debtor paid an instalment.

Private Arrangements.—H. W. SUTTON, trading as C. A. Sutton & Co., wholesale electrical supplies dealer, 110, Dale Street, Liverpool.—The creditors interested herein were called together recently, at the offices of Messrs. Latimer & Kelsall, accountants, Liverpool. A statement of affairs was submitted which disclosed liabilities of £4,233, of which £3,530 was due to unsecured creditors, and there were partly secured creditors for £703. The total amount of their claim was £933, but they held security valued at £230. There were, in addition, fully secured creditors for £3,830, holding securities of the estimated value of £4,300, leaving a surplus of £470. The assets were estimated to realise £1,721, from which had to be deducted £55 for preferential claims, leaving net assets of £1,666, or a deficiency of £2,566. The fully secured creditors were the mortgagees of the debtor's house and business premises. The partly secured creditor was the bank. The debtor commenced business in 1907 and carried it on until 1916. He then joined the Forces and his father carried on during his absence. No books were kept until 1920, when a statement prepared showed the capital at £2,849. It was stated that items of loan, &c., amounting to £1,181, which had gone into a private account, were not taken into the balance sheet at March 31st last. It was decided that the estate should be dealt with in bankruptcy. The following are creditors :—

	£		£
Brown Bros., Ltd.	664	Richardsons	280
Wightman, J. H.	620	General Electric Co., Ltd.	100
Wolff, S. & B.	283	Gilbert, J., & Co.	95
Bold, W., & Co., Ltd. ...	157		

Dissolutions of Partnership.—STEPHENS BROS., electrical and wireless engineers, 83, Stretford Road, Hulme, Manchester.—Mr. P. C. Stephens and Mr. W. Stephens have dissolved partnership. Debts will be attended to by Mr. P. C. Stephens, who will continue the business.

K. & W. RADIO SERVICE, retail wireless salesmen, 69, High Street, Thornton Heath.—Mr. R. S. Keeler and Mr. J. E. Wood have dissolved partnership. Mr. Wood will attend to debts and continue the business under the same style.

E. T. MACKRILL & SONS, electrical and general engineers, 16, Kingsbury Square, Aylesbury.—Mr. E. S. Mackrill and Mr. W. H. Mackrill have dissolved partnership.

Fire.—A fire occurred at the premises of the Kingsbury Wireless Engineering Co., Kingsbury, Hendon, on July 21st, causing considerable damage to a stock of accumulators and radio apparatus.

Deed of Assignment.—A. WALKER and C. WALKER (Walker Wireless Supply Co. and Newcastle Wireless Supplies), radio engineers and vendors of wireless goods, 31, Westgate Road, Newcastle-on-Tyne, 104, Leith Street, Edinburgh, 34, Broad Street, Aberdeen, and 58, Wellgate, Dundee.—Particulars of claims by August 4th to Mr. H. J. Armstrong, Trustee, Emerson Chambers, Blackett Street, Newcastle-on-Tyne.

Receiver Appointed.—WRIGHT MOTORS, LTD. Century Works, Halifax.—Mr. S. Laycock has been appointed receiver by the debenture-holders.

British Trade Mark Applications.—The following are among the recent applications for British trade marks. Objections against any of the proposed trade marks may be lodged within one month from July 22nd :—

Abel (lettering and design). No. 457,223. Class 8. Instruments and apparatus for use in radio-telegraphy and telephony.—Austin Brothers Electrical Co., Ltd., Manbey Road, Stratford, E.15.

Rheco. No. 458,922. Class 8. Electrical, radio, telephonic, and telegraphic apparatus.—Robinson & Hands Electrical Co., Ltd., 54, Barwick Street, Birmingham.

Adico high-tension battery, noiseless, accurate (lettering and design). No. 459,057. Class 8. High-pressure batteries.—Adie & Co., Ltd., 2, Aldermanbury, E.C.2.

Adaptolite. No. 459,734. Class 8. Radio-telegraphic and telephonic apparatus.—Compagnie pour la Fabrication des Compteurs et Matériel d'Usines à Gaz, 12, Place des Etats Unis, Montrouge, Seine, France. (British representatives : Mewburn, Ellis & Co., 70-72, Chancery Lane, W.C.2.)

Zenal. No. 452,182. Class 13. Electric fuses and cut-outs of ordinary metal.—Parmiter, Hope & Sugden, Ltd.

Glasgonex. No. 459,531. Class 13. Electric switches (ordinary), electric fuses and cut-outs.—The Midland Electric Manufacturing Co., Ltd.

Electric Power Supply in Brazil.—The July *Monthly Review* of the Bank of London and South America, Ltd., states that the governor of the state of the Rio de Janeiro has recently signed a contract with the Rio de Janeiro Tramway, Light and Power Company, by which the company undertakes to supply electricity to the towns of Campos, Macahé, and Sao Joao da Barra. The terms stipulate that the company shall pay to the State the sum of 15,000 contos over a period of ten years. It is believed that the supply of electric power to those towns, which are exclusively agricultural and produce mostly sugar, will be an important factor in transforming them into large industrial centres.

A Brazilian Telephone Concession.—It is reported that the municipal authority of Sao Paulo has approved a new contract with the Brazilian Telephone Co. The ratification of the agreement is in doubt as there is considerable opposition to the granting of a 40-year concession and to the rates which the agreement sanctions.

Electrical Construction in Brazil.—The President of the State of Sao Paulo has issued a decree calling for further and more widely-diffused electrical services in that State. New works, to supplement those already in existence and to provide power for a number of new industrial purposes, will hereafter be placed under the direction of the State Ministry of Agriculture, Commerce and Public Works.—*Reuter's Trade Service* (Sao Paulo).

Unemployment.—A PROPOSAL.—We have received a copy of a pamphlet written by Mr. E. A. Radford, F.C.A., M.P., setting forth details of the suggested remedy for unemployment which he outlined in the debate which took place in the House of Commons on June 29th. He holds that the reason for our unemployment is that British goods are costing more than those of other industrial nations, and therefore are unable to compete with them either abroad or in the home market. By all classes of the population uniting in a common sacrifice, costs must be brought down. The Government is looked to by the author as being able to ascertain the percentage of reduction necessary in the trades that suffer most from competition. If it be found to be 10 per cent., he would have an Act passed, "The National Emergency Ten Per Centum Deduction Act," which would be used to reduce by 10 per cent. during the period of national emergency until trade was re-established, all rents, royalties, ground rents, professional charges, bank interest and charges, interest on investments, salaries, insurances, postages, &c., and make an effective saving of a similar percentage in all wages. It is a big order and a remarkable conception—nearly everybody would sacrifice a considerable part of his or her income in order to be able to buy and sell more goods. A 10 per cent. reduction would be made from the wages of the "higher-paid" workers, but in the case of the "lower-paid" workers they would suffer no drop, but would give 10 per cent. more work for the same money. The Government would pay 10 per cent. less than at present in interest, there would follow a big fall in taxation, and so forth and so on. And then when everybody had agreed to make his 10 per cent. common sacrifice, the cost of living would fall and that of British goods would go down by approximately 10 per cent. Competitive sales would revive (if something did not happen to reduce foreign costs further), and the burden of unemployment pay would be lessened as trade became re-established. Unfortunately, many difficulties are anticipated in the working out of the scheme, and these we are not sure that it is worth while discussing at the present moment, for the greatest need of all preliminary to anything and everything else is that there should be real evidence of the willingness of all classes to bear their rightful share in the common sacrifice as worked out in percentages either of possession or of leisure. What endless controversy and bloodshed would gather about the settlement of what was that rightful share!

The registers of the Unemployment Exchanges showed a total of 1,248,500 wholly-unemployed persons on July 13th. This was a decrease of 51,850 on the week, but the figure was still 222,500 in excess of that of a year ago.

Engineering Employés' Wages.—A further conference took place on July 23rd between representatives of the Engineering and Allied Employers' Federation and the engineering trade unions. It was agreed to approach the Government with a view to steps being taken to secure an arrangement whereby the working hours of competitor nations on the Continent should be put on a similar basis to working hours in Great Britain.

Book Notices.—"Science Abstracts" A and B. Vol. XXVIII. Part 7. July 25th, 1925. London: E. & F. N. Spon, Ltd. Price 3s. each.

"*Journal* of the American Institute of Electrical Engineers." Vol. XLIV, No. 7. July, 1925. New York: The Institute. Price $1.

The *Transactions* of the South African Institute of Electrical Engineers. Vol. XVI. Part 4. May, 1925. Price 2s.

"Dynamo Electric Machinery," by E. Hausmann. Pp. viii+645; figs. 447. London: Crosby, Lockwood & Son. Price 21s. net.

"The Dynamo," by C. C. Hawkins. Vol. III, "Alternators." Pp. xviii+572; 710 figs. London: Sir Isaac Pitman and Sons. Price 30s. net.

Annual Holidays.—The works of Messrs. Vickers-Petters, Ltd., Ipswich, will be closed from to-night (Friday), until the morning of Monday, August 10th.

The works of the Jackson Electric Stove Co., Ltd., will be closed from August 1st to 9th for the annual holiday.

The works of the Electro-Generator Co. at Hammersmith will be closed from August 1st until August 10th for the holidays.

Messrs. E. Brook, Ltd., of Huddersfield, announce that their works and offices will be closed from Friday, September 4th, until Monday, September 14th, for the annual holidays.

The works of the London Electric Firm will be closed from to-night (Friday) and will re-open on Monday, August 10th. A small staff will be in attendance to deal with urgent business.

Income Tax.—The *Financial Times* has issued the 1925 edition of its "Income Tax Guide" (one shilling net). It has been revised by G. H. Bridge, A.S.A.A., A.C.I.S. It is based on official data and shows the amount payable, how to obtain relief, giving tables and examples, as well as chapters on Corporation Profits Tax and the new Pensions Bill.

Certificate for a Storage Geyser.—The "Bastian" electric storage geyser has been tested and approved by the Good Housekeeping Institute, and Messrs. Bastian & Allen have received a certificate for it. The firm state that theirs is the only electric geyser that has been approved by the Institute.

The German Radio Exhibition.—From Berlin we learn that over 150 firms have already secured space at the second annual radio exhibition which is to be held in that city from September 4th to 13th next.

For Sale.—Offers are invited for the whole of the plant at H.M. power station, Beachley, near Chepstow, which includes coal-handling plant, four Babcock & Wilcox boilers, economisers, one 1,000-kW set, and two 3,000-kW sets, together with switchgear and auxiliaries. Southern Railway Stores Department has for disposal surplus electrical machinery and boiler-house plant at Southampton Docks. Darlington Corporation Tramways Department invites offers for 16 single-deck, six open-top double-deck, and two covered-top double-deck tramcars. Manchester Electricity Department has for disposal three A.E.G. 150-kW motor-generators. (See our advertisement pages to-day.)

Encouraging Electric Water Heating.—We are informed by the borough electrical engineer of Woolwich (Mr. G. W. Keats) that his department has instituted a special rate for electricity for continuous electric water heating. For a 20- or 30-gal. hot-water cylinder having an immersion heater permanently in circuit a charge of ½d. per kWh is made.

Opportune Advertising.—The new high-power station of the British Broadcasting Company was opened on Monday last and advantage was taken of the occasion by the British Thomson-Houston Co., Ltd., to distribute large coloured posters of a topical nature. One of these bore a map indicating the range of the Daventry station, and the appropriate "B.T.-H." receiving sets for varying distances and requirements. The other poster advertised the best valves to use for the reception of the Daventry transmissions.

An Australian Siemens Company.—The *Financial Times*, after referring to the registration in the Commonwealth of Siemens (Australia) Proprietary, with a capital of £100, in shares of £1 each, to conduct the business of manufacturers of electric wires and cables and other electrical goods, &c., states that Mr. H. P. Slipper, general manager in Australia for Siemens Bros. & Co., and electrical trade counsellor on the executive council of the Australian Association of British Manufacturers and their Representatives, is visiting this country. Mr. Slipper, while in Great Britain, will represent the executive council in matters requiring attention in London.

Lead. — Reporting on July 25th, Messrs. James Forster and Co. stated:—"The general position is unchanged. Consumption continues on a large scale, but arrivals have been up to the average this month, though 'spot' lead is not too plentiful. . . . The present price seems high enough for the moment, particularly in view of the threatening industrial situation, but, given a satisfactory settlement, consumption will go ahead and it will then remain to be seen whether supplies will be sufficient to meet the demand."

New German Companies. — Among the new companies recently formed in Germany in connection with the electrical industry are the Schuckert Betriebe Gesellschaft, Munich, capital £150,000; the Obere-Saale Gesellschaft, Weimar, capital £50,000, to establish hydro-electric plants in Thuringia; and the Nordharzei Kraftwerke Gesellschaft, Goslar, capital £20,000.

Chinese Notes.—A local capitalist of Shihpeichen, a market town about 100 li (33 miles) from Anking (Anhwei province) is negotiating for the purchase of one of the Anking Electric Light Company's plants from which he intends to distribute electricity in the Shihpeichen district.

The trackwork of the Mukden city tramway system has been completed, and a commencement has been made with the overhead equipment.

The Radio Corporation of America.—The *Financial Times* says that in curious contrast to the experience of the British Marconi Company, not to mention the British Broadcasting enterprise, the Radio Corporation of America appears to be encountering rather difficult times. For the past quarter it reports the first deficit in its history, a net loss of nearly $400,000 for that period comparing with a net profit of almost $2,000,000, for the previous three months. Its gross income, it seems, showed a very serious shrinkage, being only about $4,500,000 for the June quarter, in contrast with $15,000,000 for the three months to the end of March. While seasonal conditions are regarded as partly responsible for the unfavourable results now disclosed, it is admitted that the chief cause of the decline in earnings is the price-cutting of rival undertakings. The corporation for the present has refused to lower its prices, but another experience such as that of the past quarter may force it to alter its decision. For the last year a net profit of over $9,500,000 was reported. All but $1,384,000 of that sum was required for the payment of the preferred dividend and $3,356,000 credited to surplus account was absorbed by taxation, depreciation and the writing down of various items.

Rumanian Orders for Cables.—*Reuter's Trade Service* (Berlin) says that, according to the *Taegliche Rundschau*, several British and German firms tendered for the supply of cables and telephone apparatus of the value of 30,000,000 lei to the Postal, Telegraph, and Telephone Department at Bukarest. One British and three German firms were successful. The *Financial Times* states that the successful British firm is W. T. Henley's Telegraph Works Co., Ltd.

Copper, Lead, and Rubber Prices.—Messrs. F. Smith and Co. report, July 28th: Copper (electrolytic) bars, £67, 5s. dec.; ditto, ditto sheets, no change; ditto, ditto wire rods, £77, 5s. dec.; ditto, ditto h.c. wire, 9⅛d., 1/16d. dec.

Messrs. James & Shakespeare report, July 28th: No change in the price of copper bars (best selected), sheet and rod; English pig lead, £36 15s., 10s. inc.

Messrs. E. Till & Co. report, July 28th: India rubber, Para, fine, 4s. 5d., 4d. inc.

Lighting and Power Notes.

Bath.—YEAR'S WORKING.—The statement of accounts of the electricity undertaking (engineer: Mr. F. Teague) for the year ended March 31st last, shows an income of £55,430, against £53,181 for the previous year. The working expenses are recorded as £31,165, against £25,779, leaving a gross profit of £24,265 (£27,402). A net surplus of £6,319 is shown after deducting the capital charges, &c., compared with £12,188 for the year 1923-4. The capital expenditure for the year amounted to £60,180, bringing the total up to £359,462. The principal items of capital expenditure were £16,756 for mains, £14,872 for machinery and plant, and £11,479 for turbo-generators. The total sales of energy for the year amounted to 4,390,951 kWh, an increase of 840,295 kWh above the preceding year. The maximum demand for the year was 3,380 kW.

Bexhill.—MAINS EXTENSIONS.—The Electricity Committee has decided to extend mains to Whydown Place, at a cost of £412, and to Limsford Cross at a cost of £1,326, when there is sufficient revenue to justify the expense.

Birmingham.—RATE RELIEF.—The Finance Committee has recommended that the Electricity, Gas and Tramway Departments should each contribute 1 per cent. of the capital value of the undertaking to the relief of the rates. This would be equivalent to £102,000 per annum.

Blackpool.—YEAR'S WORKING.—The financial statement of the electricity undertaking (engineer, Mr. C. Furness) for the year ended March 31st, 1925, shows an income of £155,327 and a working expenditure of £94,610, leaving a gross profit of £60,717. The corresponding figures for the previous year were £141,586, £88,459, and £53,127. A net surplus of £29,884 is left after deducting the capital charges, &c., against £26,567 for the year 1923-24. The capital expenses during the year amounted to £8,507, making a total of £596,070. The average price per kWh during the year was 3.08d.

AUTHORITY TO INSTALL NEW PLANT.—The Mid-Lancashire Electricity Board has given the Corporation authority to install a 2,000-kW set at a cost of £12,000.

Bournemouth.—HOSPITAL INSTALLATION.—The Corporation has decided to install electricity at the Sanitary Hospital at a cost of £2,300.

Bradford.—APPLICATION FOR LOAN.—The Electricity Committee is applying for sanction to borrow £10,310 in connection with the renewal of e.h.p. feeders to Apperley Bridge.

Calne.—APPLICATION FOR LOAN.—The Town Council has decided to apply for a loan of £6,347, the estimated cost of obtaining and distributing electricity within its compulsory area.

Canada.—ONTARIO HYDRO-ELECTRIC REPORT.—The seventeenth annual report of the Ontario Hydro-Electric Power Commission shows that after reducing rates in many rural districts and paying all operating expenses, the year's working yields a net profit of 725,000 dollars. In spite of some industrial depression, the Commission experienced an increased demand for power on almost all its systems, some of which are reaching the capacity of their existing generating stations. The receipts for power sold during the year totalled $16,897,000.

Cheadle and Gatley.—NEW CHARGES.—The Council is to abolish the present system of charging and establish a flat rate of 6d. per kWh.

Chester.—ELECTRICITY SUPPLY.—The Electricity Committee has decided to approve the terms for a supply of electricity to Hawarden Rural District Council be affirmed, and the town clerk is to be instructed to apply to the Electricity Commission to revoke the Fringe Orders authorising a supply of electricity to Mancott Royal Estate.

Chesterfield.—YEAR'S WORKING.—We have received from Mr. D. H. Davies, borough electrical engineer, a statement of accounts for the electricity undertaking for the year ended March 31st last. The total revenue amounted to £46,443, against £41,574 for the preceding year. The working costs are shown as £22,386, against £20,124, leaving a gross profit of £23,721 (£21,053). The deduction of capital charges leaves a net profit of £5,471, compared with £4,984 for the previous year; £14,994 was spent upon the capital account during the year, making a total capital expenditure of £218,667. The sales of energy increased from 5,601,315 kWh to 6,445,550 kWh, and the average price per kWh was reduced from 1.69d. to 1.64d. during the year. The maximum demand for the year was 3,567 kW.

Chichester.—PURCHASE OF SUB-STATION.—The Corporation has arranged for the purchase of a sub-station in connection with the supply of electricity to Selsey.

Continental.—SWITZERLAND.—Work is now actively in hand on the construction of the new Ober Hasli power station in the Grimsel district. To supply the necessary electrical energy for the construction work a special cable is being laid between the Central Swiss Power Co.'s station at Eiswil and Innertkirchen *via* Lungern, the Bruning Pass and Meiringen. A light railway for the transport of material is also being built between Meiringen and Innertkirchen, a distance of about three miles.

A proposal is under consideration by the Swiss Government to raise the level of Lake Taillieres in the Locle district of the Canton of Neuenburg with the object of securing increased power for electrical purposes.

ITALY.—La Società Lombarda per Distribuzione d'Energie Elettrica, has recently been authorised to erect a 135,000 V transmission line between Piattamala, near Tirano and Valsassina, across the province of Sondrio and Como.

NORWAY.—*Transformers for Bergen and Nore.*—The Norwegian A.S. Per Kures Fabrikker, of Vestre Aker, is reported to be delivering two transformers, each of 15,000 kW, for the Dale installation at Bergen, and transformers of 30,000 kW, 143,000 V, for the State works at the Nore.

Croydon.—NEW CHARGES.—The Electricity Committee has recommended the following charges:—Up to and including 1 h.p.: First 200 kWh per annum, 5d. per kWh. Over 1 h.p. and up to and including 2 h.p.: First 400 kWh per annum, 5d. per kWh. Over 2 h.p.: First 600 kWh per annum, 5d. per kWh; beyond, 1d. per kWh. Power consumers whose consumption is under 2,400 kWh per annum, if they guarantee this minimum consumption, will have the option of being charged under the time-switch system.

MAINS EXTENSIONS.—The Electricity Committee has decided on mains extensions at a cost of £2,450.

Dewsbury.—STORM DAMAGE.—During a violent thunderstorm on July 22nd, some of the overhead equipment of the Yorkshire Electric Power Co. was put out of action.

Dodworth.—BULK SUPPLY.—The Urban District Council has decided to support an application by the Electrical Distribution of Yorkshire, Ltd., to supply electricity in bulk to the district.

Durham.—SUPPLY OFFER.—The Rural District Council has decided to make further inquiries in connection with an offer from the Weardale Steel, Coal & Coke Co. to supply electricity to the Ludworth houses at 6½d. per kWh, provided the Council undertakes to collect money due from the tenants.

Faversham.—PRICE REDUCTION.—The Town Council has reduced the charge for electricity for lighting from 10d. to 9½d. per kWh.

Grimsby.—YEAR'S WORKING.—The twenty-fourth annual report and statement of accounts for the year 1924-5 of the electricity undertaking (engineer, Lt.-Col. W. A. Vignoles) records an income of £78,150, against £78,410 for the preceding year. The working costs are shown as £46,493, against £46,432, leaving a gross surplus of £31,072, after deducting bad debts. A net profit of £5,558 is shown after deducting the capital charges, &c., against £8,035 for the year 1923-4. The sales of energy increased by over a million kWh, the average price per kWh being 1.83d., and the maximum demand on the station was 4,396 kW. The capital expenditure during the year amounted to £54,326, including £32,091 on machinery and £12,428 on mains, bringing the total capital expenditure up to £415,460.

Hartshorne and Seale.—ELECTRICITY CHARGES.—The Rural Council has received from the Burton-on-Trent Town Council an undertaking that the charges for electricity in the district shall not exceed 1d. for lighting and 15 per cent. for power above the charges in operation in the borough.

Huddersfield.—APPLICATION FOR GRANT.—The Electricity Committee has decided to apply to the Unemployment Grants Committee for a grant towards the cost of the proposed extension of mains to Crosland Hall during the coming winter.

Irish Free State.—LIMERICK.—The Lighting Committee has decided to adjourn the consideration of extensions to the electricity works, pending an interview with the Minister of Industry and Commerce, relative to the probable bearing of the Shannon Power Scheme on the city's electricity supply.

Kingussie.—TEMPORARY SUPPLY.—The Town Council is asking Messrs. Balfour, Beatty & Co. if they would object to the installation of a temporary power scheme on the understanding that the supply would be taken from the company as soon as it is in a position to give it.

Liverpool.—NEW STATION.—Rapid progress is being made with the extension of the Lister Drive power station, which is to house initially two, and eventually five, 25,000-kW turbo-alternators.

London.—ST. MARYLEBONE.—The Electricity Committee has recommended special flat rates of 1d. per kWh for inside shop-window lighting after closing hours, and ½d. per kWh for water heating in blocks of flats, &c. The Council has approved of the expenditure of £20,000 for mains extensions, &c., for the two years ending March 31st, 1927.

BERMONDSEY.—The Electricity Committee is to seek sanction for a loan of £8,000 for mains, services, and meters. It is also to lay a main in Beatrice Road at a cost of £1,051.

BATTERSEA.—The Electricity Committee has decided to replace the distributors at Lavender Hill and lay conduits for future cables at a cost of £4,483. The Council proposes to adopt a scheme to improve the lighting at the town hall buildings at a cost of £1,100. The borough engineer has prepared plans for offices and showrooms for the Electricity Department at Lavender Hill.

SHOREDITCH.—The Electricity Committee has prepared a scheme for extensions to the plant at the electricity works at a cost of £70,000, including the provision of a 10,000-kW turbo-generator.

POPLAR.—The mills of Messrs. McDougall, of the Wheatsheaf Mills, Millwall Docks, are to be converted from steam and gas to electric drive. The supply, estimated at one million kWh per annum, will be taken from the Corporation undertaking.

The Electricity Committee has obtained sanction to borrow £1,413 for a low-pressure feeder from High Street sub-station to Robinhead Lane.

Middlesbrough.—APPLICATION FOR LOAN.—The Corporation is applying for sanction to borrow £3,058 for the purpose of an electricity sub-station.

Northampton. — MAINS EXTENSIONS. — The Northampton Light & Power Co., Ltd., is to extend its mains from Mill Lane to Kingswell Road.

Peterborough.—CATHEDRAL INSTALLATION.—Electric lighting is being installed in the Cathedral at a cost of £2,000.

WORKS EXTENSIONS.—The Corporation proposes extensions to its generating station, including a new 6,000-kW turbo-alternator.

Plymouth.—LOAN FOR EXTENSIONS.—The Electricity Committee is to borrow £1,000 for the provision of two transformer chambers at North Prospect.

CABLE EXTENSIONS.—The Electricity Committee has authorised various cable extensions at a cost of £2,500.

REPORT ON RIVER AVON.—The Corporation has decided to invite a firm of hydraulic engineers to report as to the sufficiency of the flow of the River Avon for the purposes of a turbine, and also as to the cost of installing the necessary plant.

Preston.—NEW PLANT.—The Finance Committee has authorised the Electricity Committee to proceed with the installation of a third turbo-generator set at Ribble power station, at an estimated cost of £90,000.

Rawtenstall.—APPLICATION FOR LOAN.—The Town Council has decided to apply for sanction to borrow £32,000 for the purpose of extending the plant at the electricity works, Hareholme.

Saffron Walden.—LOAN SANCTIONED.—The Town Council has received sanction to borrow £880 in respect of new battery plant.

Shoeburyness.—SUGGESTED SUPPLY FROM WAR DEPARTMENT.—The Urban Council has decided to ascertain if the War Department can supply electricity for lighting and power, and if so upon what terms and at what cost.

Southend-on-Sea.—NEW DIESEL.—Following the advice of Col. Ekin at the recent inquiry of the urgent necessity of making an earlier application for sanction to install a spare Diesel engine, the Town Council has empowered the Electricity Committee to accept the lowest or most suitable tender of those of six firms for re-conditioning an engine and fitting it with a dynamo at a cost of not more than £10,000.

Sowerby Bridge.—APPLICATION APPROVED.—The Urban District Council has given its consent to the application of the Electrical Distribution of Yorkshire, Ltd., to the Electricity Commissioners for a Special Order to supply electricity for public and private purposes within the urban district.

Stoke.—EXTENSION OF STATION.—As the result of a recommendation made at a conference of authorised undertakers of the North-West Midlands District that each turbine station in that area should be extended to its ultimate economical capacity in order to meet the views of the Electricity Commissioners, the Council has decided to request Mr. Arthur Ellis, consulting engineer, to report upon the ultimate economical capacity of the power house site.

TEMPORARY SUPPLY.—The Electricity Committee, at the request of Mr. W. M. Selvey, consulting engineer of the Stone U.D.C., has agreed to supply under a fringe order until the Stone U.D.C. is able to obtain a special order.

DISTRIBUTION.—The Electricity Committee has decided to erect a sub-station off Shirley Road, and to lay mains at a cost of £1,000 to supply the district below Hanley Park.

HOUSING SUPPLY.—The Housing Committee recommends a supply of electricity to all the Council houses, at a cost of £5,000.

Special Orders. — The Electricity Commissioners have submitted to the Minister of Transport for confirmation, Special Orders made by them for the supply of electricity in the following districts. Parts of the parishes of Llechwedd, Llangelignin and Llangwstenin, in the Rural District of Conway, Carnarvon, by the Borough of Conway; part of the County Borough of Barnsley, by the County Borough of Barnsley; in the Urban District and Rural District of Woodbridge, and the Parish of Melton, by the Woodbridge and District Electric Light Co., Ltd.

The Urban District Council of Dartford is applying for a Special Order to extend its area of supply.

The Wallingford & District Electric Supply Co., Ltd., is applying for a Special Order to supply electricity in the Borough of Wallingford, and the outlying districts.

Trowbridge.—LIGHTING COMPLAINTS.—The Urban District Council is to communicate with the Trowbridge Electric Supply Co. concerning complaints received as to the lighting of the Ashton and Harford Streets.

Warrington.—EXTENSION OF SUPPLY.—The Corporation has decided to lay the necessary cables, and to build a sub-station for a supply of electricity to the Thelwall area.

Electricity Supply in Preston.

Inauguration of the Ribble Capital Station.

It was in 1891 that the National Electric Supply Co. obtained a Provisional Order authorising it to supply electricity within the county borough of Preston, the company commencing on a small scale with a temporary power station pending the completion of the permanent station in August, 1892. For some years operations were confined to a portion of the central area, until an extension order was obtained in 1898. The Crown Street station not being adequate to meet the post-war demand, the company acquired a site in Penwortham, on the south bank of the Ribble. In view, however, of the fact that the undertaking was purchasable by the Corporation in 1932, negotiations which had taken place some years earlier with the Corporation were re-opened, with the result that the Corporation obtained a special order in 1922 authorising the purchase of the company's powers.

Fig. 1.—The Ribble Capital Station.

Mr. J. A. Robertson, M.I.E.E., M.I.Mech.E., who had been advising the company, was retained as consulting engineer, and the Electricity Commissioners' sanction for the new station was obtained in May, 1922, the contracts for the main plant and buildings being placed by the following September. Since construction was commenced, the Mid-Lancashire Electricity Advisory Board has been constituted so that the new station will undoubtedly play an important part in the development of the Mid-Lancashire Electricity District, which extends from Fleetwood on the north-west, to Colne and Nelson on the east, and Chorley on the south.

The Corporation has entered into an agreement with the Lancashire Electric Power Co. to furnish a bulk supply for distribution by the company in the Leyland and Walton-le-Dale districts; the mains are partly laid and a supply is expected to be available in October next, while a further development is the inter-connection of the Blackburn (Whitebirk) and Ribble stations. This line forms an important link in the technical scheme for Mid-Lancashire, and the contracts for a 33,000-volt main capable of passing 10,000 kW, with the necessary transformers and switchgear, have been placed in order that the line may be in operation before the end of the year. Negotiations have also been taking place between Preston Corporation and the coast towns, comprising Blackpool, Lytham, St. Annes, and Fleetwood for a supply of 5,000 kW (rising to 10,000 kW), and the increased demand which will be made during the forthcoming year will involve an extension of the new plant described below, which was inaugurated by Sir John Snell, chairman of the Electricity Commission, on July 22nd.

The new station, fig. 1, is situated approximately 1½ miles from the centre of the town. The site extends to about 33 acres, and the river is tidal, with a maximum variation of 22 ft., having a minimum flow during dry weather of approximately five million gallons per hour. This amount of water is considered sufficient for the first section of the station, but it is proposed to impound tidal water for the second section by constructing a weir across the river, when it is estimated that the water available will be sufficient for condensing pur-

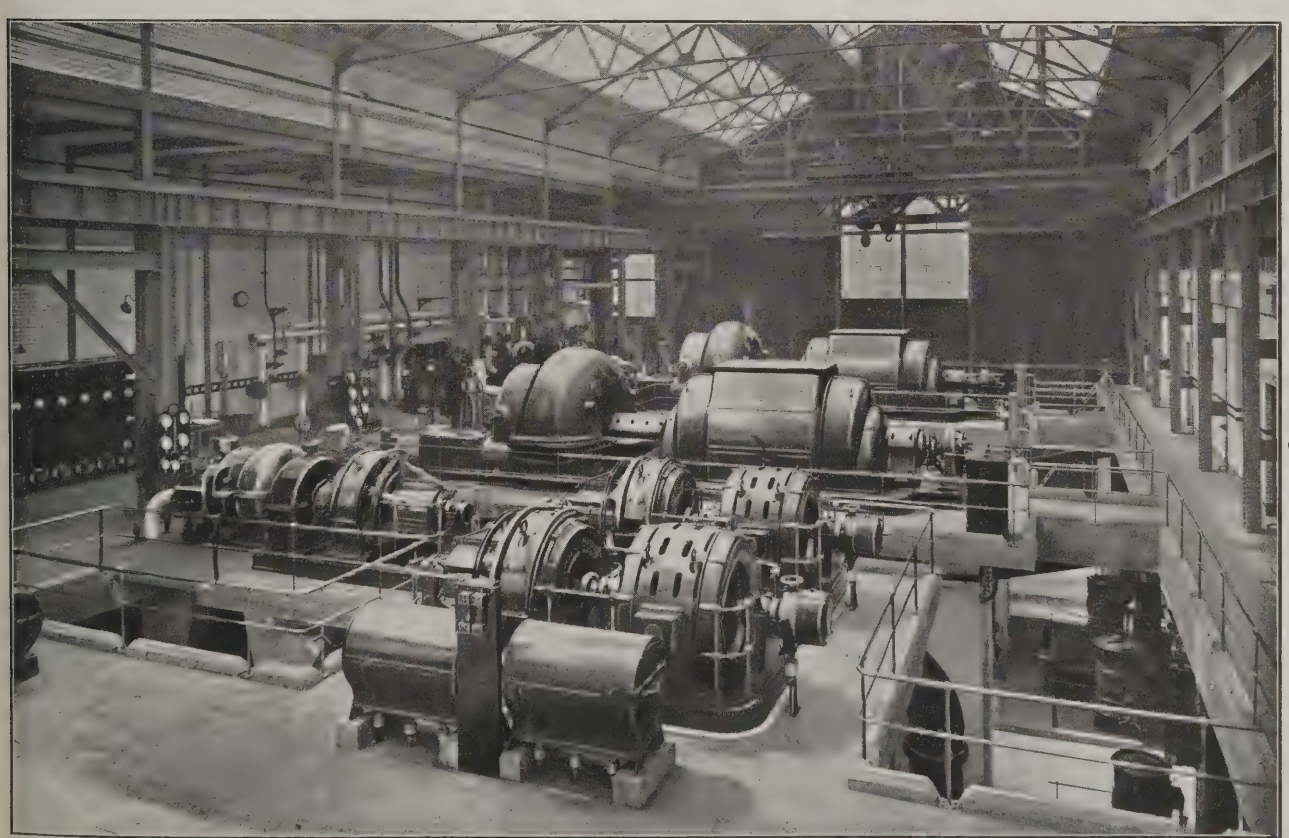

Fig. 2.—The Ribble Turbine Room; House Set and Motor Converters in Foreground.

poses for plant of 150,000 kW capacity. Coal is received by rail at the dockside on the north side of the river, and thence conveyed by an aerial transporter to a receiving tower at the power station, whence it is delivered by duplicate belt conveyors to the bunkers or to the stacking ground west of the station. A jib crane reclaims coal from the stack and delivers it to trucks, which are hauled on a light railway and tipped into a receiving hopper that is also available for road-borne coal, which is elevated by balanced skip hoists to the receiving hopper which serves the belt conveyors over the boiler-house bunkers; the belt conveyors are in duplicate, each being capable of delivering 40 tons per hour.

The ash-removal plant consists of two scraper conveyors working in water-filled cast-iron troughs. A battery locomotive transports the ashes over a narrow gauge railway to low lying dumping ground. The whole of the coal and ash plant has been supplied by the Mitchell Conveyor and Transporter Co., Ltd.

The turbine house, fig. 2, will accommodate three main generating sets, of which two are already installed, and provision has been made for extending the buildings to accommodate a fourth unit. The buildings are of steel, with brick filling, the outside walls being faced with Accrington bricks, and the turbine house is faced with white glazed bricks. The main generating and condensing plant, auxiliaries and house plant has been supplied by the English Electric Co., a considerable portion having been manufactured at the Preston works of the company. Each of the main sets has a continuous normal rating of 12,500 kW at 0.9 power factor, delivering 3-phase current at 50 cycles and 6,600 volts. The sets run at 3,000 r.p.m., and the guaranteed steam consumption at 10,000 kW output is 9.6 lb. per kWh. The turbines have seven stages, each disk carrying a single row of impulse blades, and the governor gear is of the Escher Wyss type. An oil pump lubricates the bearings and the governor relays, while an auxiliary steam-driven oil pump is provided for starting up.

Each turbine is provided with a heater, so arranged that steam may be taken from the low-pressure stages for heating the boiler feed water, and a closed system has been adopted, the water being heated partly by "bled" steam and partly by the exhaust from the feed pumps.

The alternators are totally-enclosed and ventilated on the closed air circuit system by a Heenan and Froude air cooler situated directly underneath in the main foundations.

Each of the main condensers, fig. 3, has 17,000 sq. ft. cooling surface, and is provided with two Drysdale electrically-driven circulating water pumps, situated in a chamber below the turbine house basement, fig. 4. Each pump is driven by a variable-speed motor and is capable of dealing with 85 per cent. of the rated full load. Three Hick, Hargreaves-Breguet air ejectors are provided for each condenser, each being capable of dealing with 50 per cent. of the rated full load. The plant is designed for a vacuum of 29 in., with a barometric pressure of 30 in. when supplied with 13,000 gallons of water per minute at a temperature of 53 deg. F. Duplicate condensate pumps have been installed for each main unit, arranged to deliver to a main header from which two pipes connect to surge tanks above.

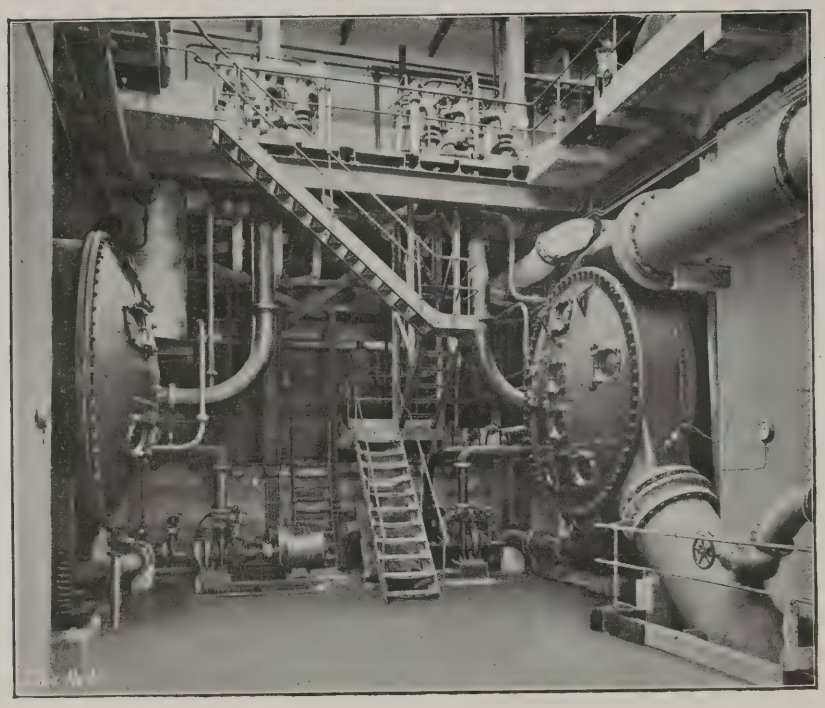

Fig. 3.—Main Condensers in Basement.

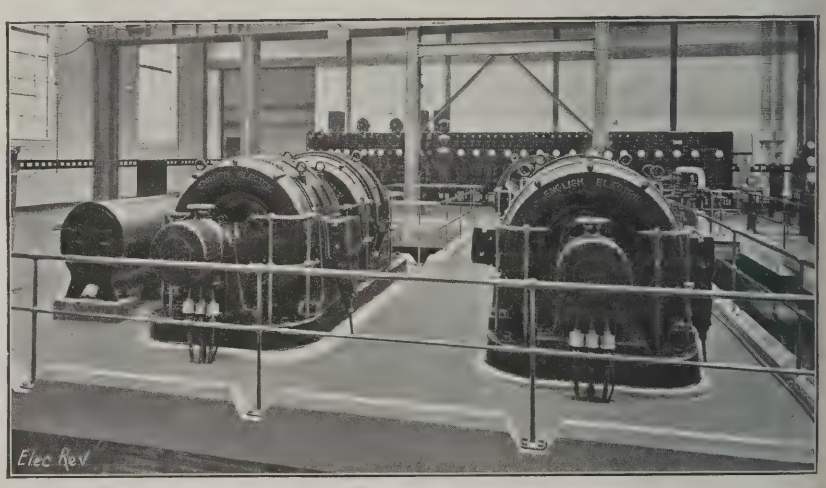

Fig. 5.—Motor Converters and Auxiliary Switchboard.

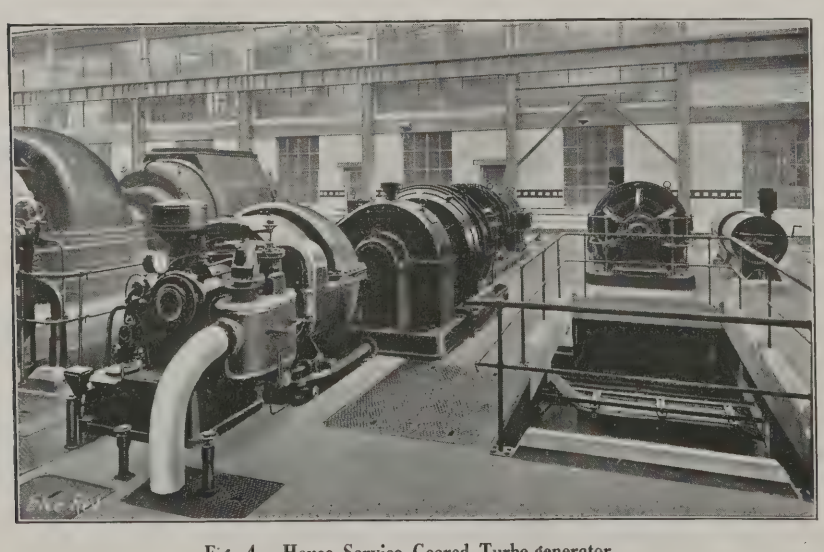

Fig. 4.—House Service Geared Turbo-generator.

Circulating water is taken from the river through a screening chamber equipped with three circular screens, by Messrs. F. W. Brackett & Co., each of 27 ft. diameter. Considerable excavation was necessary to ensure a sufficiency of water between tides, and the inlet chamber has a depth of 6 ft. below the river bed. The inlet and outlet culverts are each 7 ft. 6 in. high by 6 ft. wide, the outlet culvert being above the inlet culvert, and to meet the requirements of the Fisheries Board it discharges over a spillway 100 ft. in length on the river bank.

The whole of the auxiliary plant, except the steam feed pumps, is driven by electric motors supplied with direct current at 220 volts. The auxiliary generating plant comprises one geared steam turbine house set, fig. 4, with condensing plant of 600 kW capacity, two 600-kW motor converters, fig. 5, and a battery, fig. 11, supplied by the Chloride Electrical Storage Co., Ltd., having a three-hour discharge rate of 573 amperes and an emergency discharge rate of 2,000 amperes for fifteen minutes. The d.c. supply is used for lighting the station, and the battery is also employed for operating the h.p. switchgear. It consists of 106 cells, type TJW 12, with Planté design positive and box type negative plates. Each cell contains 12 positive and 13 negative plates, the containers being of lead-lined wood; connections between adjacent cells are burned solid to lead channel bars. Each cell is erected on oil-filled glass insulators supported by a wood stillage, which, in turn, is carried by porcelain oil insulators. The plates are separated by treated wood separators and dowels. The battery is used in parallel with the station auxiliary supply, control on both charge and discharge being normally effected by a hand-controlled booster. Provision is made for automatically cutting out the booster and throwing the battery straight on the busbars in emergency. Charging current is supplied by an induction motor-generator connected to the h.p. a.c. supply. In the boiler house, fig. 6, five Babcock & Wilcox marine crossdrum type boilers have been installed, each having an actual normal evaporation of 65,000 lb. of steam per hour at 325 lb. per sq. in., and 720 deg. F. from water at 100 deg. F. when fired with coal having a calorific value of 10,500 B.th.u. per pound; each is capable of evaporating 75,000 lb. on overload, and space is available for a sixth. When complete the boiler house will contain eight boilers of similar capacity, each complete with economiser, superheater, forced and induced draught plant, steel chimney, and "Diamond" soot blower. Three chain-grate stokers are provided for each boiler, driven from shafts extending along the length of the boiler house under the firing floor, and sectionalised by claw clutches. Four feed pumps are installed, two of the Weir type being driven by steam turbines, and two supplied by Mather & Platt, by electric motors. Each pump is capable of delivering 20,000 gallons per hour against a total head of 900 ft.

Fig. 7.—Switch Room; E.H.P. Cubicles.

Fig. 6.—General View of the Boiler House.

The h.p. switch room is in the office block, and contains at present ten 6,600-volt cubicles, fig. 7, for controlling the generators and feeders. The gear is completely enclosed in a structure of moulded stone, supported by an angle iron framework. The oil-immersed circuit breakers are three-pole electrically-operated units, each phase being actuated by cams and rollers from a common operating shaft. Normally, the breakers are operated electrically from the control desk, fig. 12, but provision is also made for direct hand

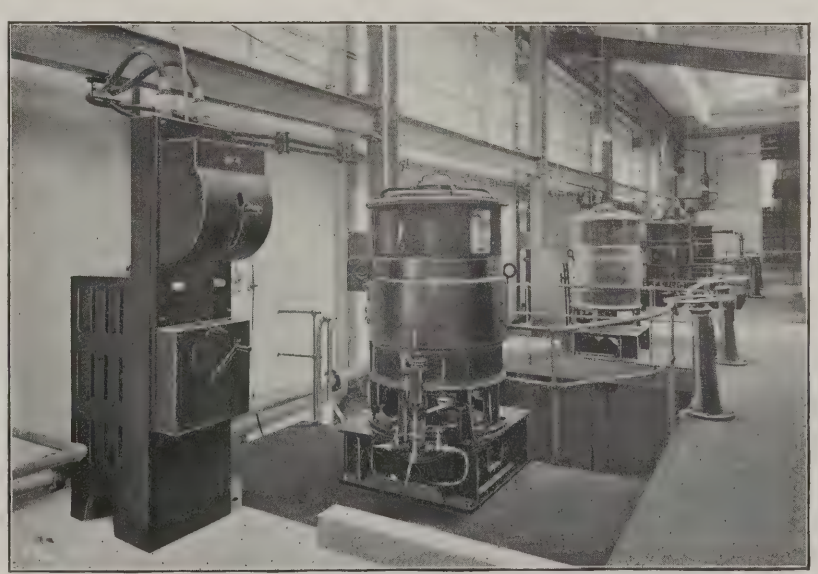

Fig. 8.—Circulating Water Pump Motors in Basement.

operation in an emergency; duplicate bus-bars have been provided throughout. The whole of the h.p. and l.p. switchgear has been supplied by the Metropolitan-Vickers Electrical Co., Ltd. Telegraph communication is available between the control room and the turbine and boiler houses. At present four 6,600-volt feeders have been connected to their respective cubicles; two additional ones will shortly be laid for supplying the borough, and two for feeding the Leyland area at 11,000 volts are being laid.

The control room is situated on the first floor of the office block overlooking the turbine room. Duplicate synchronising gear is provided, and a voltage regulator, the alternators being fitted with Merz-Price protective gear and the feeder circuits with overload time limit and leakage trip relays.

The d.c. switchboard consists of twenty-four panels, and controls the supply from the steam-driven house set, motor generators, and storage battery with duplicate bus-bars. The chief sub-station is in Crown Street, where a portion of the old steam generating plant has been removed to make room for two rotary converters of 500-kW and two of 1,500-kW capacity; a third set of 1,500 kW is on order. Rotary converting plant has also been installed at the old tramway generating station at Deepdale, and sub-stations have been equipped on the premises of large consumers, including th English Electric Co.' works* and Greenbank Mill A new static sub-station ha recently been equipped t supply the Ribbleton dis trict, where the forme three-wire d.c. network ha been changed over to three phase.

The step-up transformer of 8,900 kVA capacity, re quired for the 33,000-vo transmission line to inter connect the Ribble an Blackburn stations, will b placed in an outdoor sub station to the east of th power station. For this lin an induction regulator t give a 10 per cent. plus c minus boost will be em ployed for interchange c current, and an earthin transformer is to be installed to enable the 6,600-vo

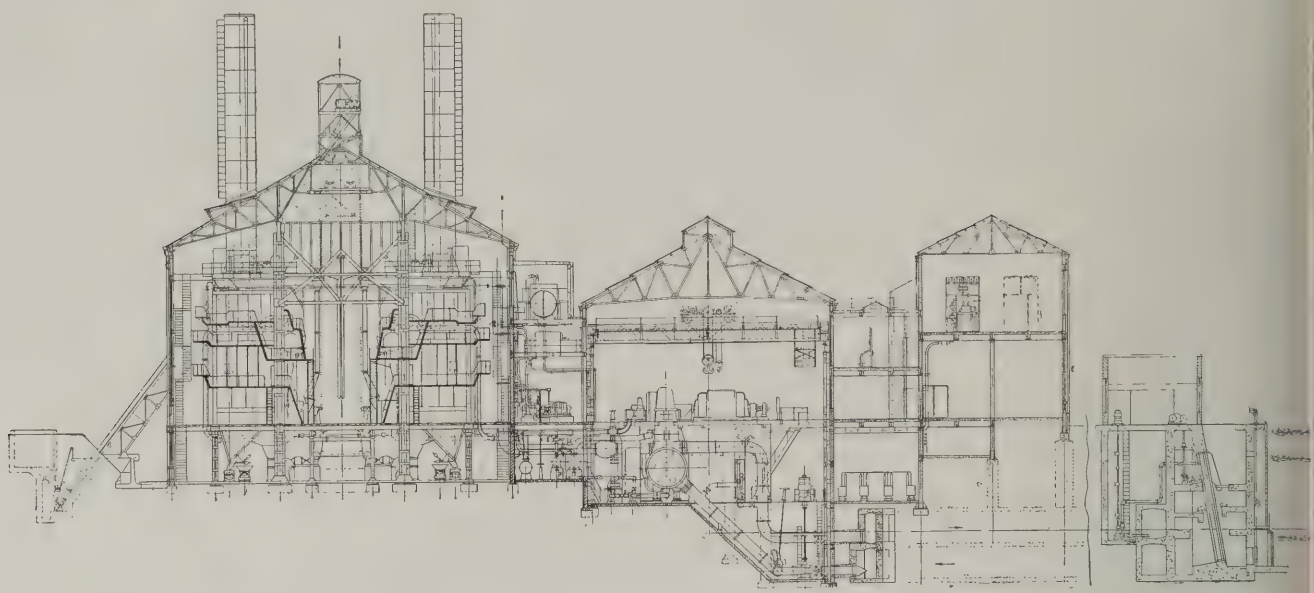

Fig. 9.—Sectional Elevation; New Ribble Power Station.

* See Elec. Rev., July 24th, 1925, p. 145.

stem neutral to be earthed when either station is shut own and receiving its full supply from the other.

n the later stages the consulting engineer received luable assistance from Mr. J. F. Simpson, borough ctrical engineer, and his staff. Mr. James Barron, bble engineer, supervised the preliminary excavation the site and the river bed, and the formation of the proach roadways.

The Opening Ceremony.

Sir John Snell, G.B.E., Chairman of the Electricity Commissioners, was Preston's distinguished visitor on July 22nd, hen he officially opened the new station. Accompanied by dy Snell, he privately inspected the station during the morning with Councillor E. A. Heaney, Chairman of the Preston ectricity Committee, and local officials. Later, there was other inspection by Mid-Lancashire civic officials, representatives of chambers of commerce, and industrialists numbering out 200, who assembled in the turbine room to witness the remony. The Mayors of Salford, Blackburn, and Lytham-St Annes attended along with Preston's Mayor and Mayoress, e Town Clerk, Councillor Heaney, Alderman T. Parkinson airman and vice-chairman of the Electricity Committee), d Messrs. J. F. Simpson (borough engineer), J. A. Robertson nsulting engineer), A. R. Dickinson (assistant engineer), and Shipton Wood (resident engineer).

Severing a silk ribbon, Lady Snell freed the stop valve of the bine and was presented with a bouquet by the Mayoress. John Snell then started the station. The Mayor presented dy Snell with a silver rose bowl.

The distinguished company at the luncheon included Mr. L. Pearce (of the Electricity Commission), Mr. W. L. chens (deputy chairman of the English Electric Co.), Mr. B. Woodhouse (president of the Institution of Electrical gineers), and Lieut.-Col. F. A. Cortez-Leigh (L.M. & S. ilway).

Sir John Snell trusted the new scheme would bring increased sperity to the locality; the new station would so affect cost t many industries not hitherto able to afford supplies from blic sources would be glad to take it. The Preston station s a model of what a new station should be. Some critics ght think it expensive, but they had had to deal with a ft. rise and fall of the river, a transporter arrangement for conveyance of coal across the river, &c., and though the tion would cost £19 per kW, another generating set (for ich the building was prepared) would reduce the average t to £15. He was told that when the next stage was carried , the cost would be reduced to about £13 per kW.

Sir John added that the day of small isolated stations was ing to a close. The English Electric Co., directly the Corration put the large station into action, arranged to take whole of its supply from the new Ribble station, a move ich pointed the direction in which things were trending. t of nearly 500 public generating stations, fewer than 100 tained 2,500,000 kW of plant and the other 300 or so had ongst them 600,000 kW. They would thus get an idea of relative importance of the few to the many. Last r municipalities produced two-thirds of the total elecal output of the country, and it was to them and other undertakings that the Commissioners looked for istance. Last year 68 per cent. of the electrical plant in s country was represented as spare, equivalent to a sum of million pounds sterling. That was the result of their policy the past of keeping stations independent of each other; it s waste of capital for which the consumer had to pay. If re had been less money expended on spare plant, and more n transmission, it would have had an all-round benefit.

On behalf of the electrical contractors, Sir John asked Councillor Heaney (Chairman of the Preston Electricity Committee) accept a memento of the opening in the form of a silver ver.

Councillor Heaney, in accepting the gift, said it had required breadth of vision to take the steps preliminary to the tion of the station. Having decided to erect it the Corration began to hunt for a load and made overtures to some the large cotton mills and power users generally, and then uced prices, but the results had more than justified their rts. They had paid approximately £300,000 for the undertak-; spent upwards of £450,000 on the Ribble station; and a ther £100,000 on mains, services, and equipment. They lt and equipped sub-stations, changed over districts from to a.c., and managed each year not only to meet the rapidly reasing costs, but to pilot the ship home to harbour with a fit in hand. They had increased the £68,000 gross income he undertaking in 1922 (when they took it over) to £105,000. year, and he believed this year it would reach £130,000. es at the time of purchase were just over 3,000,000 kWh: year they were over 8,000,000 kWh. They had 1,950 new sumers, and as a result of an exhibition last year 500 cookers been installed, or were on order. Some 33 miles of disution mains had been laid; the demand had increased from 0 to 4,500 kW, and they had entered into contracts ensura demand of over 10,000 kW during the winter. Further tracts would raise their maximum demand for 1926 to 00 kW, so that simultaneously with the official opening of station they had called a meeting of the Council the following day to consider installing a further 12,500-kW set.*

*At a cost, we understand, of £90,000.—Eds. Elec. Rev.

Alderman Astley Bell (cotton-manufacturer) proposed "The Contractors," and Mr. W. L. Hichens (deputy chairman, English Electric Co.), in responding, said the electrical industry was one of the few which had extended its export trade since the war—a great achievement, and it was in the interests of the country that such export should be maintained.

The staff and employés of the Preston Corporation electricity department marked the opening of the station by presenting Mr. J. F. Simpson, borough electrical engineer, with a silver cigarette box and Mrs. Simpson with a silver-plated coffee service and electric percolator. The gifts were handed over on July 23rd as a token of the esteem of the workers for their chief. Mr. D. S. Wood (resident engineer) presided and the presentations were made by Mr. Sydney V. Askew, the youngest and most recent addition to the power staff. Mr. Simpson suitably responded.

Tramway and Railway Notes.

Bradford.—Passenger Siding.—The Tramways Committee has approved a scheme for the construction of a tramway passenger siding close to the causeway in Town Hall Street, at an estimated cost of £1,826.

Continental.—France.—A project for the construction of a suspended electric railway between Paris and the suburb of St. Denis, a distance of about 3¼ miles, has been approved by the Seine Department Authorities. The cars would, it is stated, be constructed of aluminium and would be suspended from a rail at an average height of 56 ft. from the ground.

During June the French Southern Railway Co. converted the Lannemezan-Dax transmission line from 60,000 V to 150,000 V. It is claimed that this is the first line that has been put into operation in Europe at such a high pressure. The line forms part of the company's network which is to supply the railway lines of the company and private industries situated in the district of Bordeaux.

Negotiations are in progress between the Société Electrique Lille-Roubaix-Tourcoing and the municipal authorities of Mouscron regarding the electrification of the light railway between the Belgian frontier and Mont-a-Leux and the railway station at Mouscron and so form a new Belgian connection with the French railway system.

Russia.—*Tramway Electrification.*—The Soviet Government has recently placed a contract with the Elin Gesellschaft, of Vienna, through the Austro-Russian Industry Co., for the electrification of the steam tramway between Baku and Surahani.

Italy.—It is reported from Naples that, owing to the demand for electricity being greater than the supply, the municipal authorities have recently shut down a number of the electric tramway services in the town.

Greenock.—Non-Purchase Decision.—The Corporation is recommended to intimate to the Tramway Co. that it does not intend to exercise its option to purchase the undertaking when the lease expires in 1928; and that it is willing to negotiate as to the terms and conditions upon which a renewal of the lease might be granted.

Huddersfield.—Tramway Licences.—The Watch Committee has granted licences to the Yorkshire (Woollen District) Electric Tramways, Ltd., in connection with a service between Huddersfield and Dewsbury, *via* Bradley, Mirfield, and Ravensthorpe.

India.—Bombay.—*Local Electrification.*—The B.B. and C.I. Railway Company has set aside nearly Rs. 7½ crores exclusively to be devoted to works in connection with the Bombay Local Service, and of this amount the equipment, including rolling stock, necessary for the introduction of an electric service, will require Rs. 2 crores approximately. The distance to be electrified in the first instance, that is the line from Church Gate to Borivli, is 21¼ miles. It is hoped to finish the work by January 1st, 1927.

London.—Underground Scheme.—A scheme, involving an expenditure of £25,000,000, to provide a network of goods railways below the level of the present district system and linking up all the big termini and market centres in the Metropolis, is proposed by a party of American and English financiers who have just completed the preliminary plans.

Underground Interruption.—A defect on the supply system caused an interruption on the northbound service of the Bakerloo Railway between the Elephant and Castle and Piccadilly on July 22nd shortly after 10 o'clock. Trains running north from the terminus at Elephant and Castle were delayed while the defect was remedied. After a delay of about 30 minutes the service was restored.

Middlesbrough.—Loan Sanctioned.—Application has been made to the Ministry of Transport for permission to borrow £933, which is one-third of the total amount of £2,800 required in respect of the extension of the Tees-side Railless Traction Board's undertaking. Sanction has been granted to borrow £588 as the Corporation's proportion of the cost of a new petrol-electric trolley vehicle for use on the railless traction system.

Sunderland.—Conversion to 'Buses.—The Sunderland District Tramways have made a complete change-over from trams to motor-'buses, and the track and overhead tramway equip-

ment are being dismantled. Bolton Corporation has bought eight of the discarded tramcars and Grimsby Corporation has bought 16. The company has now a fleet of 58 motor-'buses covering a much wider area than the trams served.

United States.—RAILWAY ELECTRIFICATION.—The New York Central R.R. has been ordered by the Public Service Commission of the State of New York, says the *Railway Review*, to submit plans and specifications on or before September 1st, 1925, covering the electrification of its line from Spuyten Duyvil Creek to and including the 60th Street yard in New York City. Under the Order the New York Central is also required to submit on or before September 1st a statement of the detailed plans showing the method by which it will electrify its lines in New York City south of the 60th Street yard. The Commission granted an extension of time until September 1st in which plans for the electrification of the Putman Division and the Saw Mill River branch are to be filed.

West Hartlepool.—EXTENSION OF SPECIAL ORDER PERIOD.—The Minister of Transport has directed that the periods stipulated for the commencement of the works and for the completion and opening for public traffic of the tramway authorised by the West Hartlepool Corporation Tramway Order, 1912, shall be prolonged so as to expire on August 7th, 1926, and August 7th, 1927, respectively.

Telegraph and Telephone Notes.

Radio Navigational Aids.—COMMITTEE OF INQUIRY.—The Board of Trade Committee which is to inquire into the use of wireless in navigation will, says *The Times*, be as follows:—Sir R. Burton Chadwick, M.P. (chairman), Wing-Commander G. P. Grenfell, R.A.F., Mr. S. J. Lister, Commander F. Loring, R.N., Vice-Admiral G. R. Mansell, the Hon. Alexander Shaw, Captain J. R. Somerville, R.N., and Mr. J. R. Willis (secretary). The terms of reference are "... to advise the Board of Trade regarding the development in the United Kingdom of the service of wireless direction-finding stations, wireless beacons, and similar aids to navigation, and the location and types of such stations to be maintained."

Storm Damage.—Nearly 10,000 telephones were put out of action by the thunderstorm which broke over Paris during the evening of July 24th. The Ségur exchange subscribers were entirely cut off owing to the bursting of a sewer, and the Fleurus and Vaugirard exchanges were seriously affected. The lines of the Bourse and most of the Government offices have been restored, says *The Times*, but repairs to the Ségur exchange will take some days.

Storms also interfered with the service in this country last week. In the London area 1,200 lines were out of action, Ilford with 250 having the largest total. Of the Continental lines, most damage occurred to the Paris service, eight of the 16 lines developing faults, and one of the three lines to Antwerp was damaged. In the inland trunk service, 188 lines out of 830 were out of action.

The Telegraph Service.—DEFICIT.—When the Post Office estimates came under review in the House of Commons recently, the Postmaster-General stated that the telegraph, from the financial point of view, was the least satisfactory of the Department's services. Last year's deficit amounted to £1,300,000, which, he said, was due to the competition of the telephone service. The number of telegrams sent last year by Government Departments was only half the previous year's total.

The Telephone Service.—LARGE PRIVATE AUTOMATIC SYSTEM.—On July 27th, a large private automatic telephone exchange system was opened at the head office of the Port of London Authority. In addition to its size, a feature is the complete provision of inter-communication facilities over the very wide area covered by the dock system of the Port of London, which extends from London to Tilbury on the north side of the river and to Gravesend on the south. Each of the five dock groups has direct communication with the Post Office exchange system, and a telephone directory has been prepared by the P.L.A. giving particulars of the lines joined up by this automatic system.

TELEGRAPH MONEY BILL.—The Telegraph Money Bill, 1925, which came before the House of Commons last week, will authorise the issue of £30,000,000, which, when added to the unexpended balance available from the Act passed in 1924, will meet the capital requirements of the telephone service for about three years. *The Times* reports Sir W. Mitchell-Thomson, Postmaster-General, as having said that he had deliberately adopted the policy of laying down a programme over a period of years in the interests of the efficiency of the Post Office and of the industry concerned. He had in hand £9,400,000, which would make up a total of £39,400,000. It was intended to spend in three years £35,000,000, which would leave a balance in hand on April 1st, 1928, of £4,400,000, or, at the rate of £1,000,000 a month, about 4½ months' supply. He proposed to spend £2,500,000 during next year on the extension of the underground system. At present, in proportion to the length of the telephone service, they had got as much wire underground as the United States, if not more.

PUBLIC KIOSKS.—It is proposed to erect telephone kiosks for public use at several points in Golders Green and Hendon.

Radio Notes.

Daventry Station Opened.—On July 27th, Sir W. Mitchell-Thomson, Postmaster-General, inaugurated the new high-power broadcasting station in Northamptonshire. Situated practically in the geographical centre of England and on the summit of Borough Hill (1½ miles from Daventry) which is 600 ft. above sea level, the two lattice steel masts are 500 ft. high, so that the aerial is about 1,100 ft. above sea level. The call sign remains 5XX and the wave-length 1,600 in., while the mean input to the plates of the magnifying valves will be 25 kW, which power can be augmented when necessary.

Russia.—RADIO DEVELOPMENT.—Russia, through a broadcasting company operating on similar lines to the B.B.C. in this country, is making a bid to become one of the leading European countries using wireless for entertainment purposes. The Russian broadcasting company has nothing to do with the Soviet Government beyond working under a concession which has been granted to it, and at present it has six stations in operation—four in Moscow and one each in Leningrad and Kiev, South Russia. According to the *Evening News*, representatives of the company have recently been in England buying apparatus. The principal station in Moscow, where there are 300,000 licensed listeners, was formerly the old Russian Post Office station, and transmits on a wave length of 1,... metres at a power of 12 kW. Work is already in hand to construct this station and increase its power to 50 kW in the aerial. This work will be finished by September, and during the next few weeks four other stations, now nearing completion, are to be opened. Two will transmit at 4 kW and two at 2 kW. Then before next March no less than 30 other broadcast stations are to be erected.

Time Signals.—NEW CODE.—One of the principal objects of the International Service of Wireless Time Signals is to ensure that no ship, in whatever remote seas she may be sailing, shall ever be out of reach of them. The co-ordination of such signals can only be attempted by an international authority, and the International Astronomical Union's *Commission de l'Heure* met on July 17th for a critical discussion of the relative merits of the various codes and the times at which they should be transmitted, particularly in Western Europe. The decisions have not yet been officially announced, but *The Times* understands that it has recommended the abolition of the old Paris code as still transmitted from FL at 10.45 a.m. and p.m. ... the adoption of the International Code with the difference that in place of the last three dashes, each of the three minutes shall end with the six dot seconds as transmitted by 2... This scheme was brought forward by the British Horological Institution, whose chairman, Mr. Frank Hope-Jones, is responsible for the original suggestion and arrangements for broadcasting the Greenwich dot seconds.

Contracts Open and Closed.

(The date given in parentheses at the end of the paragraph indicates the issue of the "Electrical Review" in which the "Official Notice" appeared in our advertisement pages.)

Open.

Australia.—MELBOURNE.—September 14th. State Electricity Commission. 3,000-kVA transformers and spares.*

State Electricity Commission. September 21st. 250-kVA 22,000-V transformers and spares.

September 15th. Postmaster-General's Department. (Sch. C. 36). Telegraph equipment. Tender forms from High Commissioner, London.

NEW SOUTH WALES.—New South Wales Railways. Oct. 7th. One 20,000-kW turbo-alternator for White Bay power house.

NEWCASTLE.—September 22nd. Caledonian Collieries, Ward-Leonard electric winding engine for Aberdare cer... colliery complete with balancer, exciter, and the neces... switchgear.

Bristol.—August 10th. Docks Committee. Four 3... movable electric jib wharf cranes for the Royal Edward D... Avonmouth. Spec. (£3) from Mr. T. A. Peace, chief engi... Avonmouth Docks.

India.—August 5th. India Store Department. Ele... ceiling and table fans. (July 24th.)

August 11th. 313-kVA 3-phase alternators and exciters ... accumulator cells. (July 24th.)

Kettering.—August 28th. Electricity Works. One ... ing tower and tank circulating water pipes. (See this is...

London.—ST. PANCRAS.—September 3rd. Electricity Dep... ment. One 10,000-kW steam turbine, alternator, conden... plant, pipes, &c. (July 17th.)

ST. MARYLEBONE.—August 31st. Highways Departm... One 200-kW turbo-alternator set with surface condenser ... auxiliaries; one second-hand 200-kW, 200/220-V d.c. ge... tor set. (July 17th.)

August 26th. METROPOLITAN ASYLUMS BOARD.—Install... of additional electric lighting at North-Eastern Fever Hosp... Tottenham. (See this issue.)

Manchester. — August 7th. Electricity Department. Three-phase, 6,600-V switchgear for Dickinson Street and 3,600-V switchgear for Bowker Vale. (July 17th.)
August 18th. One water-tube boiler, &c. (July 24th.)
August 11th. Tramways Committee. Supply and delivery of steel girder tramway rails, steel fishplates, steel clip plates and coach screws. Specifications and forms of tender from Mr. H. Mattinson, general manager, 55, Piccadilly, Manchester.

Newbury.—August 10th. Board of Guardians. Electrical generating plant at the Poor Law Institution. (See this issue.)

Newport (Mon.).—August 15th. Electricity Department. Ferro-concrete foundations for a 10,000-kW turbo-alternator and condensing plant, and one 49/50-ton engine-room crane, &c. (July 24th.)

New Zealand.—WELLINGTON.—September 22nd. Post and Telegraph Department. Bituminous tape.*

Nottingham.—August 7th. Electricity Department. One 10,000-kW turbo-alternator, with exciter, condenser, air pumps, oil coolers, air coolers, and auxiliary plant. (July 17th.)

Oban.—August 4th. Town Council. Electric lighting work at six blocks of houses. Specifications from Burgh Surveyor.

Preesal.—August 17th. Urban District Council. 6,600-V cables, l.p. distribution and service cables, including excavation and reinstatement. (July 24th.)

Shipley.—August 5th. Education Committee. Installation of electric light at four Council schools and the Salt High Schools. (See this issue.)

South Africa. — JOHANNESBURG. — September 3rd. South African Railways and Harbours. Five 4-wheeled traversers and two tractors.*
October 13th. Electricity Supply Commission of South Africa. Equipment and buildings for an electric power station at Durban:—Complete boiler-house equipment, also other plant and piping; boiler-house installation, including pulverised fuel equipment with buildings, piping and other plant; steel frame buildings; overhead electric travelling crane; coal and ash-handling plant; two 12,000-kW turbo-alternators; condensing plant and auxiliary apparatus; transformers for power station; and switchgear and auxiliary plant. (See this issue.)

BULAWAYO.—September 29th. Municipal Council. Plant for the extension of the electricity works.*

* Further particulars can be obtained at the Department of Overseas Trade (Inquiry Room) 35, Old Queen Street, S.W.1.

Closed.

Australia. — SYDNEY. — Electricity Committee. Recommended:—
30,000 electricity meter coils (£599).—Weldon Electric Supply Co., Ltd.

Bexhill.—Electricity Committee. Recommended:—
Cable: Enfield Cable Works (£305); British Insulated & Helsby Cables, Ltd. (£385 12s. 2d.).
Meters, about 700.—Electrical Apparatus Co., Ltd.

Birkenhead.—Electricity Committee. Accepted:—
Six miles 7/16 single-core cable (£179 5s. per mile).—Liverpool Electric Cable Co., Ltd.
Two 200-kVA transformers (£199 10s. each) and two 150-kVA transformers (£172 each).—English Electric Co., Ltd.
Switchgear at New Ferry and Bebington sub-stations (£1,054).—Metropolitan-Vickers Electrical Co., Ltd.

Birmingham.—Education Committee. Accepted:—
Electric lighting of elementary schools.—Alston Road, Bordesley Green (£580), Messrs. Lewis & Hall; Witton Lodge, Erdington (£734), Messrs. Lea, Son & Co., Ltd.

Bradford.—Electricity Committee. Accepted:—
Extension of Odsal sub-station building.—Thos. Obank & Son, Ltd.
25-ton lifting gear for transformers at Valley Road works and Thornbury sub-station.—Herbert Morris, Ltd.
1-ton cable trailer.—R. A. Dyson & Co., Ltd.

Bolton.—Corporation. Accepted:—
Meters.—The Edison Swan Electric Co., Ltd.

Cheltenham.—Electricity Committee. Accepted:—
Cables.—British Insulated & Helsby Cables, Ltd.
Meters.—Metropolitan-Vickers Electrical Co.

Chester.—City Council. Accepted:—
Meters.—The Edison Swan Electric Co., Ltd.

Chesterfield.—Electricity Committee. Accepted:—
5,500 yd. distributor cable.—British Insulated & Helsby Cables, Ltd.

Colchester.—Education Committee. Accepted:—
Installation of electric light at St. John's Green School (£106).—E. Bailey.

Dunstable.—Town Council. Accepted:—
Wiring houses for electric light at £6 per house.—Mr. S. F. Goodwin.

Hawarden.—The Hackbridge Electric Construction Co., Ltd., informs us that the R.D.C. order for sub-station transformers has been placed with it, and not as already reported.

Irish Free State.—DUBLIN.—Contracts placed by the Controller of Stores, Department of Posts and Telegraphs during June, 1925:—
Bronze wire.—F. Smith & Co.
Copper wire.—R. Johnson & Nephew.
Electric motor.—Metropolitan-Vickers Electrical Co., Ltd.
Insulators.—W. F. Dennis & Co.; Taylor, Tunnicliffe & Co., Ltd.; Wm. J. Kellie.
Telegraph accessories.—Murray Printing Telegraph Systems, Ltd.; J. Carpentier.
Telephone accessories.—India Rubber, Gutta Percha and Telegraph Works Co., Ltd.; J. McMillan & Co.; J. Thompson.
—*Irish Electrician.*

Post Office. Accepted:—
Dry cells.—The Edison Swan Electric Co., Ltd.

Leeds.—Electricity Committee. Accepted:—
Cables.—W. T. Henley's Telegraph Works Co., Ltd. (£7,664); Enfield Cable Works, Ltd. (£2,771); Macintosh Cable Co., Ltd. (£1,974).
Sub-station at Armley (£480).—Messrs. J. Ferguson & Son, Ltd.
Sub-station at Quarry Mount (£465).—Mr. S. J. Flockton.

Lewes.—Education Committee. Accepted:—
Wiring schools for electric light (£137).—Mr. H. J. Galliers.

London.—POPLAR.—
The Electricity Committee recommends placing with International Combustion, Ltd., as prime contractors, the following orders for the extension at the electricity works:—
Main buildings (£23,505); foundations (£3,410).—Mitchell Conveyor Co.
L.p. main switchboard (£2,360).—George Ellison.
Wiring of motors (£1,675).—W. T. Glover & Co., Ltd.
Maconite cable, &c. (£910).—International Combustion, Ltd.
Distribution boards (£820).—Parmiter, Hope & Sugden, Ltd.
Station lighting (£625).—International Combustion, Ltd.
Motors, &c. (£122).—Veritys, Ltd.
Starters and gear (£177).—Brookhirst Switchgear, Ltd.
Modification of one boiler (£350).—Vickers Spearing Boiler Co., Ltd.
Treatment of circulating water (£340).—Paterson Engineering Co., Ltd.
Ash sluicing equipment (£1,490).—Underfeed Stoker Co., Ltd.
Surge and storage tanks (£1,056).—International Combustion, Ltd.
Additional batteries (£722); switchgear (£25).—Hart Accumulator Co., Ltd.

GREENWICH.—Board of Guardians. Accepted:—
Installation of electric light in the West Block of the Institution (£319).—Electrical Installations, Ltd.

Perth.—Electricity Committee. Recommended:—
New economiser for the electricity works.—E. Green & Son, Ltd.

Stoke.—Electricity Committee. Accepted:—
Electrical interlocks for conversion sets at Longton and Stoke sub-works (£53 each station).—Metropolitan-Vickers Electrical Co., Ltd.
New battery for electric vehicle (£172).—Chloride Electric Storage Co., Ltd.
L.p. switchgear (£803).—Berry's Electric, Ltd.
Wiring at central power house extension (£1,142).—Barnett & Soans.
Grab crane (£3,091).—Alex. Jack & Co., Ltd.
Two 25-kVA transformers (£116).—Metropolitan-Vickers Electrical Co., Ltd.

Warwick.—Board of Guardians. Accepted:—
Installation of electric light at the Infirmary (£497).—Ellis & Ward, Ltd.

Forthcoming Event.

Institution of Electrical Engineers (London Students' Section).—Summer Meeting in London. July 25th to August 1st.

Notes.

Wireless Societies.—At the invitation of the Committee of the Wireless Section of the Institution of Electrical Engineers, Mr. James Nelson was present at a meeting of the Committee held on July 25th, when the question of a suggested new wireless society was discussed with him. A statement on the subject will shortly be published, but it is stated that the definite conclusion has been arrived at that there is no need for a new body.

New Belgian Electro-Technical Association.—The Comité Electrotechnique Belge has been formed by representatives of various electrical associations in Belgium to represent Belgian interests on the International Electrotechnical Commission and to deal with electrical standardisation questions in Belgium.

British Engineering Standards Association. — The B.E.S.A. held its 7th annual general meeting on July 9th, when the chairman, Sir Archibald Denny, Bart., took a more hopeful view of affairs than was possible 12 months ago. The balance sheet showed that the deficit carried forward from the previous year had been reduced from over £1,900 to £677; he regretted, however, that owing to there being at the present time no further funds for the purpose, the valuable work of translating the British standard specifications into foreign languages and disseminating them abroad had had to cease.
For some time past the Association has had under consideration suggestions for widening the scope and influence of its work, and we are now informed by the secretary, Mr. C. Le Maistre, that the Main Committee has decided to enlarge the membership, so as to enlist the active support of professional engineers, industrial firms, and business men connected with all the great industries of the country, who are invited to become members at a minimum annual subscription of two guineas. Technical and trade organisations connected with the work of the B.E.S.A., as well as public utility undertakings, are also eligible, while the members of the Technical

Committees, who give their time and experience to this national work without fee or recompense and who now number some 2,300, are in future to be known as honorary members. All members will be entitled to privileges, including direct representation on the Main Committee through a duly elected Advisory Council, as well as being able to apply to the organisation for advice on any matters of simplification or standardisation as carried on in this country and in the other large producing countries. Present contributors are being invited to become members without additional fee and are being asked to maintain their present contributions.

As an E.C.A. representative of the B.E.S.A., Mr. W. R. Rawlings, in an appeal for new members, points out that the annual report contained some interesting figures; for instance, the number of committees was 474; members of committees numbered 2,294; the number of new and revised specifications issued during the year was 54; the sale of specifications increased during the year by over 10,000; and the total sale of specifications per year amounted to 54,405.

The carrying out of the above, including the working of the whole organisation, cost only £16,729, which Mr. Rawlings thinks all must agree, shows that the B.E.S.A. is one of the most economical associations in existence.

Appointments Vacant.—Shift charge engineer, for Lancaster Corporation electricity department; assistant shift charge engineer, for St. Marylebone Council electricity department; Diesel engine fitters, for the Gold Coast Government Railway (£380-£12-£480 per annum); boiler house assistant engineer and two junior generation assistants, for the Hull Corporation electricity department; clerk for the Sevenoaks and District Electricity Co., Ltd. The Walsall Corporation is advertising for a tramway manager to succeed Mr. C. Burgess, who is leaving for an appointment in the East The salary offered is £800 per annum, rising by £50 per annum to £900. (See our advertisement pages to-day.)

American Electric Vehicle Progress.—Endorsing the sales promotion campaign conducted last year by the Society for Electrical Development, representatives of all the leading electric truck and battery manufacturers in America at a recent meeting in New York subscribed a tentative budget of £5,000 for a similar campaign for 1925. A well-defined programme of sales promotion, embracing the preparation and distribution of special articles for trade journals and newspapers, will be put into effect. There will also be special studies dealing with the logical relation of central stations to the electric truck industry. During the past four years the number of electric trucks in use in the United States is said to have shown an increase of 64 per cent.

It is announced from Detroit, U.S.A., that Mr. Ernest M. Howe, who is described as a British transportation expert, has been elected president of the Gray Motor Corporation, and that the concern has obtained exclusive manufacturing rights in America for Tilling-Stevens petrol-electric 'buses, all parts of which, except the electrical equipment, are to be made in the United States.

Second World Power Conference.—In continuation of the work initiated by the First World Power Conference at Wembley last year the *Financial World* announces that the International Executive Committee held its first meeting, under the chairmanship of Mr. D. N. Dunlop, director of the British Electrical and Allied Manufacturers' Association, in London on July 27th. Twenty countries sent representatives, among them being the United States, India, Canada, Australia, New Zealand, France, Germany, Italy, Holland, Switzerland, Sweden, Russia, Norway, Denmark and China. Mr. O. C. Merrill, secretary of the Federal Power Commission, was the delegate for the United States; M. Tribot-Laspiere, director of the Union des Syndicats de l'Electricite, for France; Mr. Conrad Matchoss, director of the German Engineering Association, for Germany; Mr. J. W. Meares, electrical adviser to the Government of India, for India; Dr. E. Tissot, President of the Swiss Association of Electricians, for Switzerland; Mr. J. G. Bellaar Spruijt, President of the Association of Electrical Companies, for Holland; and Mr. S. Klouman, of the Aluminium Company, for Norway.

South Devon Inquiry.—The Torquay Corporation, the Salcombe, Ashburton and Kingsbridge Urban Councils, and the Newton Abbot and Kingsbridge Rural Councils, were represented at an inquiry opened by Col. T. C. Ekin, chief engineering inspector of the Electricity Commission, at Newton Abbot on July 21st and 22nd, into the applications made by Mr. Raymond Hartree, of Salcombe, for an order empowering him to supply electricity in central South Devon, and by the Teignmouth Electric Lighting Co., Ltd., for a similar order relating to parts of the same rural district. In the case of Mr. Hartree it was said that he was prepared, if his application was granted, to give a bulk supply to Teignmouth; he did not wish to hamper the Teignmouth undertaking, but when he had done the work and spent the money it was not fair for a company to come in at the eleventh hour and be granted the cream of the area. It was cheaper to run the gas and electricity undertakings together rather than separately, and he had already spent £4,500 in connection with the order. He also had an option to purchase the Dartmoor Electricity Supply Co. Mr. Uttley, of Sir Charles Bright and Partners, Ltd., gave details of the work necessary to be carried out by Mr. Hartree under the proposed order, the total cost involved being £96,700.

For the Teignmouth Electric Lighting Co. it was said tha Mr. Hartree's application was two years old, and the Teign mouth Co. had been held up very considerably by the fac that a competing application was in existence. The Teign mouth Co. was anxious in the autumn of last year to lay cable between Torquay and Teignmouth, and but for Mr Hartree's application being in existence might have laid main last year. As a result of not being able to do this som temporary plant had to be put down. It was urgent tha the company should get permission to lay a cable now be tween Torquay and Teignmouth. If it could not do this would have to put down more temporary plant. The Teign mouth Co. considered that as it was taking energy from To quay it would be a natural sequence and in the interests the area it desired to serve that it should have this order. Th company was anxious to supply Shaldon, which had no ga supply, and was going to take a main over there this year it could. At Teignmouth the company had four 60-h.p engines or four 40-kilowatt sets, and one 10-kilowatt set, total of 170 kilowatts. The demand last winter was 142.2 kil watts, and the company was estimating for 190 kW by Chris mas next and 400 kW in four years. It was proposed to charg 10d. per kWh for lighting in the extended area, provided n abnormal circumstances arose, and 5d. for power, with di counts for large users.

It was suggested that £6,000 would be a very generous off for the Dartmoor Electricity Supply Co.'s concern, and reply, for Mr. Hartree, it was pointed out that the Teignmout Co. was hardly larger than the Dartmoor Co.

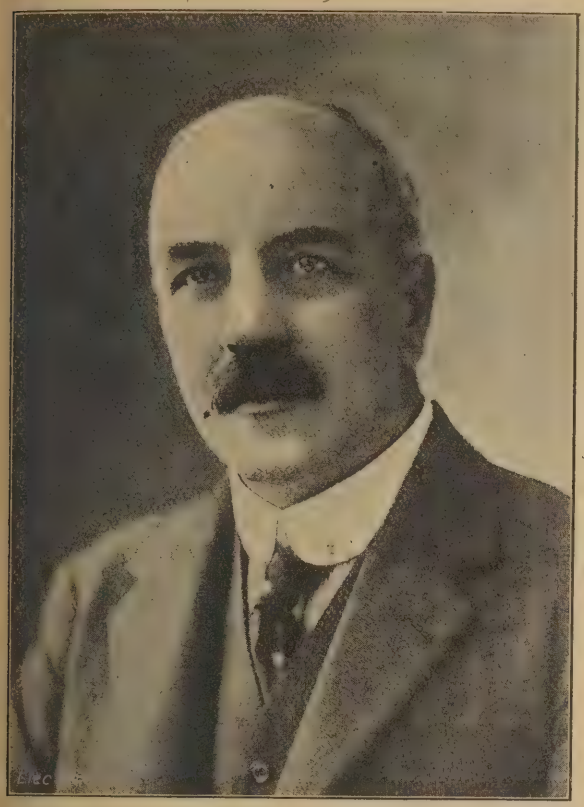
Subsequent to the ending of the inquiry, Col. Ekin made tour of the districts concerned.

Institution Notes.

Institute of Metals.—The programme of the annu autumn meeting has just been issued. The meeting ope in Glasgow on September 1st with a lecture by Sir Jo Dewrance, K.B.E., on "Education, Research, and Standard sation." The mornings of September 2nd and 3rd will devoted to the reading and discussion of sixteen papers deali with many differing aspects of metallurgical work. In t afternoons visits will be paid to works in the Glasgow distri and in the evening of September 2nd a reception is to be giv by the Lord Provost and Corporation of Glasgow. The co cluding day of the meeting, September 4th, is set apart for visit to the Trossachs and Loch Lomond.

Institution of Electrical Engineers.—Society of Rad graphers.—The Council of the Institution of Electrical En neers, which took an important part in founding the Society Radiographers in 1920, and under that Society's constituti has hitherto nominated six out of the eighteen members of t Society's Council, has withdrawn its nominees and terminat the Institution's connection with the Society. This action h been taken because the majority of the Council of the Soci of Radiographers has resolved upon certain alterations of t Society's articles, with which the Council of the Institution in entire disagreement, as in the I.E.E. Council's opinion th alterations will materially lower the professional status of n medically qualified radiographers.

Institution of the Rubber Industry.—The final for t Wallwork Challenge Cup, under the auspices of the Golf S tion of the Institution, was played off at Sunningdale on J 17th, the winner being Mr. E. A. Utley (Birmingham). H. Standring, in presenting the cup, regretted the absence Col. Wallwork and Mr. J. H. C. Brooking, a vice-president the Institution.



Royal Society.—Summer Conversazione.—The Society h its second soirée of the year at Burlington House on July 22 and was honoured with an afternoon visit from the King a Queen, who examined the exhibits and were present at lantern lecture by Mr. F. E. Smith on "Navigational Device A source of interest to their Majesties was the display "Telephotographs" (see Elec. Rev., July 24th, 1925).

Our Personal Column.

(Electrical men are invited to enable us to keep readers of the "Electrical Review" posted concerning their movements).

Mr. Joshua Kidd Bruce, whose appointment as gen manager of the London County Council Tramways Departm in succession to Mr. A. L. C. Fell, was confirmed at the Cou meeting last week, is 53 years of age. Mr. Bruce, for greater part of a year during the war, while Mr. Fell absent owing to illness, was in charge of the tramway syst The General Purposes Committee, in reporting that it wa the best interests of the service that he should be appoin general manager said:—"He has had intimate experience the working of the Council's system as traffic manager 15 years, and as deputy chief officer of tramways for 6½ ye He is a member of the Council of the Institute of Transp and from November, 1919, to January, 1925, was a mem of the Sub-Committee of the Advisory Committee on Lon

Traffic which dealt with traffic regulations. We are informed that for the last six months Mr. Bruce has been very successful in operating the Council's tramways, and has initiated several improvements of a striking character which have effected considerable saving. We have no hesitation in recommending Mr. Bruce for the appointment."

[London. & A. Photos]

Mr. J. K. Bruce,
General Manager of the L.C.C. Tramways.

The address of Mr. O. C. WAYGOOD, hon. secretary of the Mersey and North Wales (Liverpool) Centre of the I.E.E., is now Astbury, Forest Road, Meols, Hoylake, Cheshire.

Mr. W. WEEKES, chief assistant electrical engineer under the Shoreditch Borough Council, has been appointed borough electrical engineer, on probation for a period of twelve months, at a salary of £850 per annum, in succession to Mr. C. Newton Russell, who is retiring at the end of the year. Mr. Weekes has been in the service of the Council, or the Vestry which preceded it, since 1897.

Captain A. D. NEWBURY has resigned from the staff of Messrs. Sparks & Partners, consulting engineers, on appointment as chief assistant engineer to the Notting Hill Electric Lighting Co., Ltd.

The Hon. A. G. V. PEEL has joined the board of the Globe Telegraph and Trust Co.

Mr. HERBERT W. WATTS, who, as stated last week, has been appointed electrical engineer to the Epsom Urban Council, is power station superintendent in the Cheltenham Corporation Electricity Department. There were 92 applications for the post at Epsom.

MR. CECIL GRIFFITHS, who has for the past three years held an appointment in Persia with the Anglo-Persian Oil Co., has been appointed commercial electrical engineer at Calcutta for the firm of Alex. Laurie & Co., London, and he left for India on July 11th.

The German Society of Engineers awarded the Grashof medal—its highest order of merit—to Dr. ING. OSKAR VON MILLER on the occasion of his 70th birthday. Dr. Miller is regarded as the pioneer of hydro-electric work in Germany.

The Halifax Tramways and Electricity Committee has increased the salary of Mr. ROGERSON, the borough electrical engineer, by £120 per annum in order to bring it into conformity with the recognised scale.

On Monday last, Mr. S. L. PEARCE, who has become a member of the Electricity Commission, was honoured at a farewell luncheon at the Town Hall, Manchester. Alderman Nagnall, chairman of the Electricity Committee, presented Mr. Pearce with an illuminated address.

On July 20th, Mr. GUY BURNEY was the principal guest at a dinner held at the New Hotel Metropole, when 26 of his associates representative of the whole telephone industry, met under the chairmanship of Sir Hugo Hirst, Bart., to express their esteem and to bid him farewell on his resignation of the managing directorship of the Sterling Telephone and Electric Co., Ltd. Sir Hugo proposed the toast of the guest of the evening, which was received with musical honours. He then presented Mr. Burney with a six-branch cut-glass candelabra on behalf of the assembly. He remarked that he and most of the guests had known Mr. Burney for a very lengthy period, many of their friendships going back over a period of a quarter of a century, and although their business interests had often been opposed, they had always remained friends. Mr. Burney, in a reply which was reminiscent of his long career, hinted that after enjoying a well-earned holiday he might return to the industry in some capacity or other. Other speeches followed.

Obituary.—MR. G. F. C. PRATT.—The death took place on July 22nd, at Gloucester, of Mr. George Frederick Charles Pratt, who at the age of twenty went to America to develop his experience, and was eventually appointed superintendent of the Bell Telephone Co. at Philadelphia. He returned to England in 1900, and joined the engineering staff of the National Telephone Co. When the undertaking was transferred to the Government he was appointed assistant engineer in the Post Office Telephone Department, at Gloucester, and he retired under the age limit in April, 1924. He was 62 years of age.

New Companies Registered.

Gil-Ray Trading Corporation, Ltd. (207,400).—Private company. Registered July 21st. Capital, £2,000 in 2,000 ordinary shares of 5s. and 1,500 preference shares of £1. Objects: To acquire the undertaking and all or any of the assets and liabilities of Allan C. Gilmour, trading as Gil-Ray Radio Co. and Gil-Ray Trading Corporation, together with the trade mark "Gil-Ray," No. 452,575, and to carry on the business of wireless manufacturers and factors, metal and general merchants, store keepers and universal providers. The life directors are:—A. C. Gilmour, 42, Bacon Lane, Roe Green, Kingsbury, N.W.9, secretary; I. J. Lithauer, 7, First Avenue, Hove, manager (managing director). Qualification (except first directors), £250. Remuneration, £250 each per annum. Registered office: 35, Sicilian House, Southampton Row, W.C.1.

Gilfillan Brothers, Ltd. (207,424).—Private company. Registered July 22nd. Capital, £2,000 in £1 shares. Objects: To acquire the business of Gilfillan Brothers carried on by H. W. Cook at 63, High Holborn, W.C.2, and to carry on the business of manufacturers of and wholesale and retail dealers in wireless apparatus and the components parts thereof, &c. The directors are:—H. W. Cock, 64, Elm Grove Road, Barnes, Surrey; S. M. Forwood, 22, The Drive, Loughton, Essex; C. L. Weller, Bendrose House, Amersham Common, Bucks. Qualification, 200 shares. Remuneration, £260 each per annum. Secretary: S. M. Forwood. Solicitors: Marchant, Newington & Dommett, 27, College Street, E.C.4. Registered office: 63, High Holborn, W.C.1.

Burwood (Concessionaires), Ltd. (207,398).—Private company. Registered July 21st. Capital, £1,000 in £1 shares (500 7½ per cent. cumulative preference and 500 ordinary). Objects: To carry on the business of importers, exporters and manufacturers of and dealers in electrical machinery, wireless receiving and transmitting apparatus, accessories and parts, automobile lamps, kinematograph goods, &c. The permanent directors are:—J. H. Wood, 20, Lesbia Road, Clapton, secretary; L. R. Wood, 20, Lesbia Road, Clapton, electrical engineer; G. Davis, 16, Lamb Lane, Hackney, telegraph engineer. Remuneration of first directors, £50 each per annum. Solicitors: Foster, Grove & Jay, 35, Finsbury, Square, E.C.2.

Continental Radio Import Co., Ltd. (207,450).—Private company. Registered July 23rd. Capital, £1,000 in £1 shares. Objects: To carry on the business of manufacturers, importers and exporters of, agents for and dealers in electrical and other instruments, appliances, supplies and components in connection with wireless telegraphy and telephony, and wireless communications, scientific instruments, &c. The first directors are:—S. Kremner, 377, Cheetham Hill Road, Manchester, merchant; I. Kremner, 3, Oakfield Street, Cheetham Hill, Manchester, merchant. Qualification, £10. Solicitors: Neville Isitt & Co., 26, Brazennose Street, Manchester. Registered office: 26, Brazennose Street, Manchester.

Alfred Roberts & Sons (1925), Ltd. (207,449).—Private company. Registered July 23rd. Capital, £25,000 in £1 shares. Objects: To acquire the business of Alfred Roberts & Sons, Ltd., incorporated in 1921, now in liquidation, and to carry on the business of manufacturers, producers and sellers of rubber and rubber goods of all kinds, and all goods, compounds and materials in the manufacture or preparation of which rubber, caoutchouc gum, gutta-percha, xylonite, vulcanite, stabilite, celluloid, asbestos, fibre, paper, leather or textile materials or other like substances may be used, &c. The subscribers (each with one share) are:—R. S. T. Shelly, Aston Brook Street, Birmingham, engineer; T. W. Horton, 4, Bennetts Hill, Birmingham, solicitor. The first directors are:—R. S. T. Shelley (chairman), W. Mansell and E. Lawrence, addresses not stated. Qualification: 500 shares. Solicitors: Wragge & Co. 4, Bennetts Hill, Birmingham.

Sunlight and Electric-Therapeutic Nature Treatment, Ltd. (207,352).—Private company. Registered July 18th as a company limited by guarantee and not having a capital divided into shares, with 20 members each liable for 1s. in the event of winding up. Objects: To act as an institute for electrical operations and practices, comprising and utilising any type of sunlight radiation for medical-therapeutic purposes, whether carbon arc lamps, mercury-vapour, green, blue, and ultra-violet or other rays, &c. The first directors are:—G. A. O. Hanlon, 18, Adam Street, Adelphi, W.C., director of Securities Finance Corporation, Ltd.; Hilda M. Simmons, 72, Woodlands Avenue, Wanstead, technical therapeutist. Secretary: Hilda M. Simmons.

Shirebrook Electric Supply Co., Ltd. (207,358).—Private company. Registered July 18th. Capital, £5,000 in £1 shares. Objects: To carry on at Shirebrook and elsewhere the business of an electric lighting and supply company. The directors are:—M. Robinson, 158, Station Road, Shirebrook; A. Riley, 18, Main Street, Shirebrook; G. Barker, 166, Station Road, Shirebrook; G. M. Webster, Market Hotel, Shirebrook; G. H. Oade, 6, Market Square, Shirebrook. Qualification, 100 shares. Secretary: E. Edson. Solicitor: J. J. B. Young, 25, Bank Street, Sheffield. Registered office: Church Drive, Shirebrook.

J. F. Rispin, Ltd. (207,349).—Private company. Registered July 18th. Capital, £500 in £1 shares. Objects: To acquire the business of a motor and electrical engineer carried on by J. F. Riskin at Well Lane, Batley, as "J. F. Rispin & Co." The subscribers (each with one share) are:—J. F. Rispin, 7, Grove Place, Leeds, electrical and motor engineer; Mrs. L. A. Rispin, 7, Grove Place, Leeds. J. F. Rispin is the first director. Qualification, 100 shares. Solicitors: Watts & Son, Dewsbury. Registered office: Well Lane, Batley.

Cecil Cooper & Co. (London), Ltd. (207,343).—Private company. Registered July 18th. Capital, £12,000 in £1 shares. Objects: To adopt an agreement with Cecil Cooper & Co., Ltd., for the acquisition of the London branch of their business and to carry on the business of electricians, mechanical engineers, manufacturers, and workers of and dealers in electricity, motive power and light, &c. The subscribers (each with one share) are:—W. H. Tyrrell, 147, Oakwood Court, Kensington, W., chartered accountant; J. P. Southwell, 38, The Ridgeway, Golder's Green, N.W., chartered accountant. C. J. Cooper is one of the first directors, and may retain office for life. Solicitor: W. B. Wattson, 31, Budge Row, E.C.4. Registered office: 14, Gloucester Road, Kensington, S.W.7.

Official Returns of Electrical Companies.

Thermal Electric Works (Hackbridge), Ltd.—Debenture dated July 10th, 1925, to secure £500 charged on the company's undertaking and property, present and future, including uncalled capital. Holder: A. Keene, 5, Barmouth Road, Wandsworth Common, S.W.

Berrite, Ltd.—Satisfaction in full on March 12th, 1925, of mortgage dated July 21st, 1924, securing £2,700 and further advances. (Notice filed July 17th.)

Orlings Telegraph Instrument Syndicate, Ltd.—Issue on July 13th, 1925, of £25 debentures, part of a series already registered.

Atkinson, Lloyd & Co., Ltd.—N. Wood, of 26, Corporation Street, Manchester, ceased to act as receiver or manager on June 2nd, 1925.

City Notes.

Reports and Meetings of Electrical Companies; Dividend Results, &c.

Greenwood and Batley, Ltd.

The annual meeting of this company was held on July 22nd, Col. O. C. Armstrong, D.S.O. (chairman), presiding. Col. Armstrong, in moving the adoption of the report and accounts (see ELEC. REV., July 17th, p. 109) referred to the depressed state of industry generally and the general engineering industry particularly. He considered that while the unsettled state of Europe and the inflated currency of Continental countries was responsible for a great deal of this there were other factors. Although there had been an improvement in conditions on the Continent, the expected reaction upon our export trade had not materialised. In fact, things had become worse and our unemployment figures were higher. One of the most serious causes of the trouble was the attitude adopted by certain sections of labour. They did not seem to gauge the gravity of the situation. They did not realise that no industry or occupation stood by itself; the cost of coal, railway rates, public utility services, freights, dock charges, &c., all acted and reacted upon the cost of production. The short-sighted view prevailed that each section was a law unto itself. If the men would neither accept a lower wage nor work harder for longer hours, there could only be one outcome—the gradual attrition of many of our industries and the handing over of a large proportion of our foreign trade to our competitors. The chairman also referred to the burden of taxation, and said that he would place little confidence in the committee which was being set up to consider the matter unless its terms of reference included the condition of a fixed minimum of reduction, leaving only the excess to their determination. Turning to the accounts, the chairman said that in spite of the bad times the company was in a strong financial position. The reserves and the surplus of the profit and loss account totalled over £200,000, representing 57 per cent. of the paid-up ordinary share capital. The valuation of the works was £398,918—a low figure. The shareholders could congratulate themselves upon the company's satisfactory position. It was difficult to forecast the results of the current year. Although the orders for the first quarter were less than in the first quarter of last year, a number of good inquiries had been received. The works had been maintained in a high state of efficiency and were prepared to cope with any orders which might be received.

Marconi International Marine Communication Co., Ltd.

Senatore G. Marconi (chairman) presided at the annual meeting of the company on July 24th, and in dealing with the report and accounts (*vide* our last issue, p. 149), he said that the total revenue was slightly in excess of that of the preceding year. The net profit included £26,000 from investments, so that the profit from the company's business operations was about £57,000. This compared unfavourably with the profits of previous years, but in view of the unprecedented depression in the shipping industry the result was not unsatisfactory; the company could only prosper when shipping was prosperous. The company was in a very strong financial position, holding more than £550,000 of gilt-edged securities in addition to substantial bank deposits. For each of the company's £1 shares 10s. was invested in securities earning not less than 5 per cent. The chairman mentioned that the company had recently completed 25 years of service and he reviewed some of the work which had been done. He said that although allowance had been made for depreciation in the ordinary sense, the rapid development of radio-telegraphy demanded something more than that if an efficient service was to be maintained. Since 1920 the company had spent £100,000 in keeping up to date stations on hire to shipowners. Maintenance charges had increased considerably, too, and it might be necessary for some years to come to spend £20,000 annually on modernisation. The company had adopted the policy of allowing a reduction of rental to shipowners when their vessels were laid up; since 1921 £27,277 had been granted in this way. Referring to the experiments in radio-telephony between ships and between ships and the shore, Senatore Marconi said that the results demonstrated that there was no technical difficulty in the way of instituting a satisfactory service of duplex radio telephony, especially between ships on the high seas, away from the areas of congested radio-telegraphic traffic. The company was quite ready to exploit the possibilities of this system as soon as a demand arose for it, but it would merely act as an adjunct to and would not supersede radio-telegraphy. The demand for the company's direction finder had rapidly increased. The company did not think it desirable for the Government to enforce the new regulation compelling the installation of an automatic calling device on vessels carrying a crew of fewer than 50. The chairman said that in efficiency and organisation the company was unrivalled. He would no prophesy as to the future; they could only hope that the depression in industry would soon pass away. In conclusion, he referred to the death of Mr. Godfrey Isaacs and Mr. W. W. Bradfield, and he mentioned the appointment to the board of Mr. Henry Morgan and Sir Bertram Hayes, and that of Mr. F. S. Hayburn as general manager. The report and accounts were adopted after a brief address by Mr. F. G. Kellaway, the deputy chairman and managing director.

Chili Telephone Co., Ltd.

In presenting the report and accounts (*vide* ELEC. REV., July 10th, p. 68) at the recent annual meeting, the chairman (Mr. Eric B. Butler-Henderson) said that the company's business had steadily advanced in spite of the political changes which had taken place in Chile, and had tended to arrest general commercial progress. The basis tariffs under the new concession had proved unsatisfactory. Under this concession the company had to provide automatic plant at Santiago and carry out extensive improvements at Antofagasta, Concepcion, Iquique, Vina del Mar, and other districts, in addition to new trunk-line communication between Santiago and Valparaiso and at various other places. A large amount of this work had been carried out; the new plant at Santiago was in course of manufacture by Messrs. Siemens Bros. & Co., Ltd., a capacious concrete building was being erected, and it was hoped to have the plant installed in January or February next. The technical staff was engaged in constructing the new trunk lines from Santiago to Valparaiso. At Concepcion underground work was being pushed forward, and a modern c.b. switchboard plant for this centre was being made by Messrs. Ericsson at Stockholm. At Antofagasta similar work was being done and a c.b. switchboard plant also made by Messrs. Ericsson, had already arrived there. An extension to the Valparaiso automatic plant, made by Messrs. Siemens Bros., had been installed, and a special composite cable had been laid from Valparaiso to Vina del Mar. The work had necessitated new capital and that was the reason for the issue of £156,000 of shares during the year. Negotiations were proceeding with the authorities for permission to institute a more remunerative tariff and he (the chairman) had every confidence that satisfactory arrangements would be made. In briefly reviewing the accounts, the chairman pointed out that the revenue had been very slightly affected, although the net profit was lower by about £8,000. In view of the developments the directors considered it necessary to transfer £10,500 to the reserve for plant renewal, which involved a reduction in the final dividend.

Victoria Falls and Transvaal Power Co., Ltd.

The annual meeting was held on July 23rd, the Marquess of Winchester in the chair. In moving the adoption of the report (ELEC. REV., July 17th, p. 108), the chairman said that the profit and loss account for the year after providing for the service of the debentures, depreciation, and taxation, showed a net profit of £349,852. The maximum dividend of 10 per cent. had again been paid on the preference shares and 12½ per cent. on the ordinary shares, compared with 10 per cent. for 1923. £50,000 had again been added to reserve, which now stood at £350,000. He was pleased to report that the company's business and prospects continued to be quite satisfactory. The plant capacity had been fully loaded as in the previous year, and further demands for power had been notified. The present supply was being well maintained, though the further demands for power by the mining industry had caused some anxiety as regarded the margin of spare plant. That position would be entirely relieved when the Witbank station which was being built by the company for the Electricity Supply Commission, came fully into commercial service. At the time also the final adjustment of prices arranged in the new power contracts of the further discount of 2½ per cent. would come into force. The erection of the first section was due to be finished by the end of the current year. Meanwhile they had also sent out an additional 12,500-kW turbo-alternator for erection at Rosherville. That machine would be available for service within the next few months, and would not only secure the stability of their supply at the moment but also be a most valuable and useful permanent addition to their plant. The arrangements under the new agreements with the Electricity Supply Commission and with the mining groups were working quite satisfactorily and harmoniously, and he looked forward to a period of steady business free from the difficulties which were previously always with them through the uncertainty of the interpretation of contracts. At previous meetings he had referred to their lease of the power at the Victoria Falls which asset up to the present they had never been able to turn to account. The cause of that was that there was no market for power in that part of Africa. Nevertheless, they had the matter always before them and would welcome the time when the population of Rhodesia and its industries would require sufficient power to justify the development of the Falls

Marconi's Wireless Telegraph Co.

The report for the past year states that although large sums were devoted in the last accounts to the writing-down of assets, it has become necessary to allocate still further sums to this process. The sum £75,140 has been credited to the general reserve, being the ipany's share of the amount of £127,609 received from the t Office in respect of war services; the balance has been l to the subsidiary company operating the Carnarvon sta-n. First convertible debenture stock has been purchased he market to the extent of £70,595 and the cost in excess ar value has been deducted from the general reserve. On other hand, this reserve had been credited with the pre-um obtained from the issue of 500,000 new ordinary shares. net profit for the year, after providing for debenture in-st, was £225,600—an increase of £53,056. The addition he balance brought forward makes available £628,159. It roposed to pay a final dividend of 5 per cent. on the ordi-y shares (making 10 per cent. for the year) and to carry ard a balance of £310,652. The beam stations for com-nication with the Dominions and India are being built for ration by the Government. The company is to receive a lty of 6¼ per cent. on the gross radio receipts of these ices. The "beam" system is developing satisfactorily. ent experiments showed that communication with Canada Australia could be maintained throughout the whole day, the results with India and South Africa have removed all bts as to the company's ability to fulfil its guarantees. The rt-wave system is considered to be the future method of ing with commercial messages. An arbitrator has been inted in connection with the company's claim against Government for the use of its patents by the Services dur-the war, and every effort is being made to expedite the iminary work. The meeting is to be held to-day (Friday).

Petters, Ltd.

Speaking at the company's annual meeting on July 23rd, the chairman (Sir E. W. Petter) said that the accounts for the past year showed a distinct improvement, but were still suffering from periods of slackness which ate the profits earned during the busy times. The directors osed to fund the arrears of dividend on the preference es amounting to £45,000 and it was hoped to pay off the ars in a shorter time than that provided for under the me. He attributed the unrest in the engineering industry ne effect of the high rates paid to those employed in shel-l industries. It was impossible to increase the wages of ed men, although, relatively, an increase was justifiable. scheme for funding the arrears of preference dividend approved at a subsequent extraordinary meeting.

---

ench Company.—The *Société Française Radio Electrique*, h made a net profit last year of 2,108,722 fr., reports that only were the works fully occupied on radio-telegraphic rial for the Government and private undertakings, but "Radiola" department had had a busy year in meet-he demand for broadcast receiving sets and components. further extensions are being carried out at the works at llois-Perret.

lgian Companies.—The report for last year of the *Société ctricité du Bassin de Charleroi* shows a net profit of ,608 fr., as compared with 2,220,831 fr. in 1923. *Société d'Electricité du Nord de la Belgique* reports a t of 4,738,400 fr. as against 3,739,485 fr. in the preceding

echo-Slovakian Company.—The *North Bohemian Elec-y Works Co.*, Podmokly (Bodenbach), has paid a dividend per cent. for last year, as in 1923.

ock Exchange Notices.—Dealings in the following have specially allowed by the Committee under Rule 159, and ommittee has ordered them to be officially quoted:—
utta Electric Supply Corporation, Ltd.—191,116 new ordinary shares each, fully paid, Nos. 1,025,462 to 1,216,577.

ttenham District Light, Heat, and Power Co.—The ividends on the 5 and 5½ per cent. preference shares have paid in respect of the half year to June 30th last. The stock receives a dividend at the rate of 7⅛ per cent. per m (as against 8 per cent. in 1924), and the "B" stock t the rate of 5⅞ per cent. per annum (as against 6½ per

gentine Light and Power Co., Ltd.—The directors state owing to the delay in completing the audit of the accounts e subsidiary companies for their incorporation in the com-s accounts, the annual meeting will not be held until rly autumn. It is stated that the accounts show a steady rovement in the revenue position.

ndon Electric Supply Corporation, Ltd.—An interim nd of 3s. per share, being at the rate of 6 per cent. per n, for the six months ended June 30th, has been declared e preference shares, and a dividend of 9.6d. per ordinary being at the rate of 8 per cent. per annum, has been ed for the same period.

Kalgoorlie Electric Tramways, Ltd.—The report for 1924 shows gross receipts of £26,079 and a net profit of £5,148—a reduction of £2,297, which is attributed to the depressed state of business and motor-omnibus competition. The number of passengers carried decreased from 1,927,398 to 1,729,414. The meeting was to be held yesterday (Thursday).

Puebla Tramway, Light and Power Co.—The net profits of this company in Mexico for 1924 amounted to $1,272,584 (Mex.), equivalent to £129,909. After paying all expenses, including mortgage interest, note service interest, and sinking fund contributions, a balance of £1,682 is carried forward.

Vickers, Ltd.—Dividends of 2½ per cent., less tax, have been declared for the half-year ended June 30th, on the 5 per cent. preferred stock and the 5 per cent. preference shares. The cumulative preference shares receive 2½ per cent., free of tax.

Northern Mexico Power and Development Co.—The report for 1924 shows a net income of $364,842 as compared with $293,193. The proceeds of a bond issue during the year ($300,000) were applied to extensions. The dividends accrued during 1920 and 1921 on the preference shares have been paid.

Western Union Telegraph Co. (Inc.).—The earnings report for the six months ended June 30th last shows a gross revenue of $55,448,011 and a net income of $6,043,234, as compared with $59,938,214 and $6,965,937 respectively in the first half of 1924.

Kensington and Knightsbridge Electric Lighting Co., Ltd.—The directors have declared an interim dividend on account of the year ending December 31st next of 5s. per share, less tax, on the ordinary shares, payable on August 8th.

Charing Cross Electricity Supply Co., Ltd.—The directors have declared an interim dividend on the ordinary shares of the West End Undertakings for the half-year ended June 30th, at the rate of 1s. 6d. per share.

Consolidated Gas, Electric Light and Power of Baltimore.—A dividend of $0.5 per share has been declared on the common shares of no par value, for the quarter ending September 30th.

Canadian Marconi Co.—By a special Act of the Canadian Legislature the name of the Marconi Wireless Telegraph Co., of Canada, has been changed to "Canadian Marconi Company."

Northampton Electric Light and Power Co., Ltd.—The following interim dividends have been declared:—2½ per cent. on the 5 per cent. preference "B" shares, and 4 per cent. on the ordinary "B" shares.

Herbert Morris, Ltd.—A dividend at the rate of 7½ per cent. per annum has been declared on the ordinary shares for the half year to January 31st last.

Llanelly and District Electric Supply Co., Ltd.—A dividend at the rate of 6 per cent. per annum has been declared on the ordinary shares.

Metropolitan Railway Co.—An interim dividend of 2 per cent. actual, has been declared on the ordinary stock. The Surplus Lands stock is to receive 1½ per cent., actual.

Rushden and District Electric Supply Co., Ltd.—The directors have declared an interim dividend of 3½ per cent.

Mather & Platt, Ltd.—An interim dividend of 5 per cent. actual, free of tax, has been declared, as in 1924.

Metropolitan Electric Supply Co., Ltd.—An interim dividend at the rate of 6 per cent., as in 1924, is announced.

Stocks and Shares.

MONDAY EVENING.

THIS seems to be the time of year for which strikes, lock-outs and other labour disturbances show peculiar partiality. This week is one of fresh crises in the particular areas affected by mining and railway problems. The shadow of a possibly extensive strike casts depression over Stock Exchange markets. There is some little talk about the likelihood of a reduction in the Bank Rate, but this, as a Stock Exchange factor, is practically ignored, and it is improbable that any change will be made until the monetary requirements of the autumn are provided.

Business in the Stock Exchange is quiet. The rubber boom, as such, has tamed considerably, though there is still a very large volume of trade being done, in consequence of the continued strength of the price of raw rubber. The protest of the India Rubber Manufacturers' Association against retention of restriction upon rubber output remains the subject of a good deal of discussion. The standard of exportable rubber becomes raised this week to 75 per cent. of the allowance

granted to companies that conform to the Stevenson Restriction scheme, and this in itself should relieve the situation to the extent of providing, within the next few weeks, a material increase in the supplies.

Home Railway stocks are dull, owing to the fears of a lock-out in the mining districts. Metropolitan ordinary at 69½ is tolerably steady. The company has declared an interim dividend of 2 per cent., being the same rate as that of last year. Districts went back to 45, and the Undergrounds have not varied.

Interim dividends are in course of declaration by the various electricity supply companies. The Charing Cross announcement is at the rate of 1s. 6d. per share, *i.e.*, 7½ per cent., an increase of 3d. per share over the 1924 payment. No alterations are made by the London Electric Supply Corporation at 4 per cent., County of London at 5 per cent., Metropolitan and Llanelly both at 6 per cent. The Charing Cross increase comes as a pleasant surprise, for it had not been expected that any of the London companies would pay more, in their interim distributions, than they did a year ago. The price of the shares remains at 46s. 9d. London Electrics and County ordinary are both 6d. down. Westminsters drooped similarly to 45s., and Yorkshire Electrics to 29s. 6d. Edmundsons at 20s. 6d. are ex dividend. The new County preference are firm at 9d. to 1s. premium. Chiswick Electric 4½ per cent. debenture rose 2 to 86½.

Attention has been drawn for some time past to the great desirability of providing cheaper power for the encouragement of home industries. The companies that supply wide fields in the country are doing their best to reduce rates and to increase their area of supply. They operate upon lines distinct altogether from those of the West-end companies in London, and to compare, as some people are doing, the charges made by the latter companies with those of the big provincial power undertakers is to misunderstand the positions occupied by the two different classes of company.

The Marconi Wireless Telegraph Company announces a dividend making 10 per cent. for the year, whereas anticipation had prepared itself for a reduction in the rate, following upon the cut recently made in its dividend by the Marconi Marine. The parent company's net profit for the year came to £225,600, and conservative critics are inclined to think that the directors are scraping the pot a little too clean by distributing 10 per cent., having regard to the increased capital which now ranks for dividend. The report refers to heavy depreciation of foreign currencies, which, together with the possibilities of certain subsidiary companies, has rendered it necessary to make greater provision than was expected when the directors six months ago issued a circular expressing the opinion that necessary provision would not reduce the general reserve account below 1½ million pounds sterling. This reserve is now reduced to £1,047,902, sundry assets having been written down by £678,000. The price of the shares is unchanged at 1⅜, and Marines at 18s. 9d. show no recovery from their last week's dulness.

The Radio Corporation reported a loss in its last quarter's receipts, the net being $391,000, compared with a net profit of nearly two million dollars in the March quarter. The Radio Corporation has refused to lower its prices, and cutting by rival companies is considered to be the chief cause for the decline just reported. The gross income for that same June quarter came to $4,600,000, against 15 million dollars for the March quarter. The Common shares celebrated the occasion by rising ⅜ to 11¼, leading to mild wonder, on the part of the London market, at the New York demand which caused the advance.

Brazilian Tractions are the chief feature of strength in their group, the price rising 2 points to 61, in consequence of the steady improvement in the Brazilian rate of exchange. The company is doing well, according to its last report, and any such rise in the exchange rate makes a very substantial difference to the company's earnings. Cape Electrics at 1⅛ are better this week.

The Eastern group of cable companies is quiet as regards its prices. Eastern Extensions are ⅛ better; Globe ordinary ⅛ lower. United River Plate Telephones have fallen to 7⅛. It was announced in Parliament last week that the sum of 35 million pounds sterling is proposed to be spent, over the next three years, upon the further development of the telephone system. Automatic Telephones are 2⅛ and Internationals 24s. Enfield Manufacturing ordinary have risen to 3 1/16. Johnson and Phillips weakened to 39s. 6d., Electric Constructions to 30s. 6d., British Insulated to 61s. 3d. On the other hand, Siemens are a little better at 25s. Babcock & Wilcox keep steady. Coal, engineering and steel shares maintain a moderately firm front. The Stock Exchange declined to believe in the likelihood of a lock-out taking place; so, although prices became dull and depressed, they were not flat. Rubber shares reacted from the best, business dropping into more normal and jogtrot grooves after the mad excitement which culminated in the frenzy of a fortnight ago, and was sufficient, in itself, to burn out the healthy vigour of any boom.

The First International Congress of Radiology.

(*Continued from page 112.*)

Light Sources Used in Actinotherapy.

Mr. T. THORNE BAKER contributed a paper on "The Analysis ıd Comparison of Light Sources used in Actinotherapy" be- ıre Section II (Electrotherapy and Actinotherapy) on July ıd. He pointed out that the recent extension of the work ɔne in actinotherapy had resulted in the use of a large num- ɛr of different illuminants. Artificial sunlight, so-called, was ɛing administered in some cases, ultra-violet light in others, ıd the time seemed to have arrived when some attempt at andardisation of these light sources should be made, as some them were being used a little indiscriminately. Arc lamps ere used with plain carbons and with carbons cored with ırious chemical substances; tungsten pencils, and pencils of uminium and other metals had been employed; the electric ɔcillatory spark had been similarly used, as well as the ıartz mercury vapour lamp and other types. These different ght sources varied enormously in spectral composition and their relative intensities in different regions of the spec- um, and the purpose of the paper was to give some very ɛneral ideas of their comparative energy distribution, as ɛtermined by the use of a large Hilger quartz spectrograph.

The pure carbon arc had been shown to approach most ɛarly the colour temperature of sunlight, and, owing to the ɔmparative continuity of the spectrum of the light from the ɔsitive crater, this source might be regarded as the best ɔproach to sunlight as a primary standard. The carbon arc so most closely approached the spectral distribution of sun- ght. The following table showed a comparison between the ılour temperatures of various light sources and sunlight:—

Source.	Colour temperature, degrees absolute.	
Tungsten lamp	2,360 deg. K.	
Gasfilled lamp	2,950 ,, ,,	
Carbon arc	3,700 ,, ,,	Approx.
Noon sunlight	5,000 ,, ,,	

Spectrograms of various illuminants were shown, and the ·sults of the author's investigations showed that, for all kinds sunlight treatment, the metallic or cored carbon arc lamps d not simulate sunlight anything like so accurately as the ɔsitive crater of the plain carbon arc or as the gasfilled metal- ament lamp; that metal arcs, or metallic-cored carbon arcs, ɔntained a high proportion of ultra-violet light which was ɔt present in the solar spectrum as measured through the mosphere at any known altitude, but that they did contain considerable proportion of irritant short rays; and that, if ese harmful rays were filtered out by boro-silicate glass, such ·cs could be made to simulate sunlight far more closely.

Finally, it seemed to be urgently necessary to carry out far ore extensive investigations as to the energy distribution in e spectra of the various illuminants using the photo-electric ll and not merely the photographic plate, with its limited ɔabilities, as at present many actinotherapists were working most as much in the dark as were radiologists in the early ɣys of X-rays. The author said that Mr. W. A. Balwain and mself were engaged in estimating the spectral intensity of e various therapy lamps for each 100 wave-lengths of the tra-violet spectrum by means of photo-electric cells. This ork would take some months, but it was hoped to communi- te the results to the Institute of Radiology.

The Industrial Uses of X-rays.

Before the Physics Section on July 2nd, Mr. C. Norman emp, of Edinburgh, read two short notes: (*a*) "The Appli- ɪtions of X-rays in the Technology of Coal" and (*b*) "X- ɣs in Industry, with Special Reference to Technical Radio- gy." Both the communications were in general terms.

With regard to the former subject, Mr. Kemp said it had ɛen shown in this way that coal contained two distinct pes of ash, one which was associated with the coal sub- ance proper and could not by any process be removed from , namely, the portion which under the stereoscope gave a ore or less uniform field, and the other, the free ash, which ıowed up as blackish banding and could be removed from the ıal by suitable treatment. This was of more interest than ɔpeared at first sight, because it facilitated removal of the ɔh and non-burnable material from the really useful portion the coal that was mined. Thus there was an important ɔld for the examination of coal by means of X-rays before it as put on the market.

In his second communication Mr. Kemp emphasised the ɪportance of introducing technical radiology as a distinct ıence and for providing facilities for teaching it. Generally ɛaking, at our universities and colleges there was a small diological laboratory in which some extremely useful work as carried out but otherwise, in the main electrical engineer- g departments of the large technical institutions in this ·untry the matter never seemed to have received any con- ɪeration at all until three years ago, when he was asked to ve a course at the Royal Technical College, Glasgow; that ork had since been continued, and had aroused a considerable nount of interest. In this country the utilisation of X-rays r industrial firms seemed to be rather behind that in others, notably France and the United States. If training in X-ray technology became a normal course for electrical engineers, they would at least be provided with knowledge which they could turn to account when the occasion arose.

Dr. V. E. PULLIN (Director of Radiological Research, Woolwich Arsenal) said the value of radiology to industry was a subject he had been trying to push for a great many years. There must be numerous undiscovered ways in which X-rays could be employed in industry. At the same time, as the result of very large experience, he felt that X-ray equipment at the present time was not in the state it might be in to enable them to obtain definite decisions upon industrial problems. There was also the danger of people being over-ambitious, and failure to do the impossible might react upon the science and result in its being condemned unjustly by prospective users. As an instance of the value of X-rays in solving practical problems, he mentioned the serious railway accident in the North of England last year, when the tire of a wheel gave way, and X-ray examination of it showed at once the nature of the fault which had led to this unfortunate accident. That involved the penetration of 4 in. of steel, which appeared to be the maximum possible at the moment. One of the most important pieces of apparatus, industrially, was the X-ray spectroscope, which had been used so much to study various materials. He felt very strongly that it was to the development of that instrument that industry must look for its more immediate benefits.

Mr. J. R. CLARKE (Sheffield) expressed some doubt as to whether X-ray technology could be included as part of the curriculum of engineering education, except at the expense of some other item.

Dr. H. MOORE (London) said that, although there were certain definite ways in which X-rays could be used for industrial purposes, there were difficulties; unless a flaw in steel, for instance, happened to be at right angles to the direction of the beam, it might not be observed as a flaw on the X-ray plate.

Dr. E. A. OWEN (National Physical Laboratory) said that, although they were doing a great deal of an industrial nature with X-rays at the N.P.L., he had never been able to obtain positive results. It was not at present possible to say that if a flaw was not discovered by X-ray examination, there was no flaw present.

Producing Current at Constant High Pressure.

An interesting discussion on this subject took place before the Physics Section on Friday, July 3rd.

Mr. C. E. S. PHILLIPS said that the introduction of any apparatus or device which would increase the precision with which the radiation dose could be administered, must be regarded as a step forward. For this reason, the introduction of apparatus for the production of current at constant high voltage was of very great importance. Work was being carried out with this end in view in all countries, and greater efficiency must follow the use of such apparatus. One of the chief difficulties in the construction of apparatus of this type was the avoidance of corona in the condenser, and it was desirable to know how to make a condenser which would be of reasonable dimensions for the required capacity, possibly of the order of 0.02 mfd, to withstand 200,000 volts or more at the terminals, the design to give accessibility for removing the large amount of soot and dust from the air which very quickly settled upon highly electrified apparatus in large cities. Special arrangements had been made in this connection in several of the types of constant high-pressure apparatus which were on the market, such, for instance, as that of the Radiological and Surgical Co. in this country and Messrs. Gaiffe & Gallot, of Paris.

Radiation from a Coolidge tube with such an apparatus was richer in short-wave lengths than those produced under analogous conditions by means of a transformer. There was, too, an important constructional advantage in being able to get a potential across the tube which was double that across the transformer. Other points in favour of the system were the steadiness of the meter reading and greater reliability in the reproduction of any set of conditions. Further, it was claimed that the time taken for an exposure could be considerably reduced, but the outfit did not give a homogeneous beam, due to obstructions and other irregularities at the target. Although the Wimshurst influence machine had definitely been proved to give a constant current at high pressure when connected to a non-inductive resistance, it failed to do so when a Coolidge tube was introduced into the circuit.

Prof. F. DESSAUER (Frankfort) gave an account of some experiments carried out during the past three years at the Frankfort University upon new systems for the production of current at constant high pressure. The result of this work had been the evolution of a system in which single storage battery cells could be connected in series or parallel at will. The apparatus described consisted of individual units capable of giving 25,000 volts, a series of these units being connected together to give a higher voltage. A circuit was shown of nine units connected together, the current being 30 milliamperes at 225,000 volts. Each unit consisted of the battery, transformer, and a kenotron, and was complete in itself, having only to be connected to others.

Dr. H. Moore (London) said the main advantage to be gained by the use of X-ray generators of constant voltage was that it allowed comparisons of results to be made in a much more accurate manner than was now the case. Another point was that if the current was being sent across the X-ray tube at a certain definite voltage, one could be certain of getting the most efficient working with the tube for the particular voltage in use, and one got a more nearly homogeneous beam of X-rays than with a transformer set or a coil set. Practically all constant-voltage sets—with the exception of two with which he had worked—had kenotron valves as rectifiers, and they also worked on single-phase current. When one put single-phase current through a kenotron valve and tried to smooth it out to get constant potential with a fluctuation, say, of not more than 5 or 10 per cent., it was necessary to use quite big smoothing condensers unless the frequency happened to be fairly high and it was difficult to design condensers to do that work satisfactorily.

Dr. G. Failla (New York) said he had heard that tubes did not last as long with constant-pressure apparatus as with transformer apparatus. Moreover, American experience showed that with the higher frequencies the insulators did not last so long as with the lower frequencies.

Prof. Dessauer said that he had found that tubes lasted very much longer with his system of constant potential, and that the kenotrons lasted 700 hours.

Dr. F. L. Hopwood (St. Bartholomew's Hospital, London) said that one of the most important aspects was the reduction in time of operation. At the present time one treatment lasted several hours, and it was hoped at St. Bartholomew's Hospital to change over to the constant-pressure system and to be able to diminish the time of treatment by something between 20 and 50 per cent. If that could be done, as he believed it could, it would diminish the sufferings of the patients tremendously.

Dr. Failla said that the use of water-cooled tubes resulted in very much shorter exposures being necessary. In several installations in the United States the treatment was now complete in from five to seven minutes.

Dr. Dessauer said the condensers in the system he had described were used in series as he had mentioned, and they gave an absolutely equal distribution with alternating current, which was very important.

The Chairman, in winding up the discussion, said that they could look upon the work of the Physics Section with considerable satisfaction, because it had made a recommendation with regard to an International Committee on measurement and standardisation, and had also proposed to take steps concerning methods of protection. High-pressure current at constant voltage was the thing of the future, and they should try to impress that fact upon their medical colleagues.

An International Committee.

On July 4th, there was a meeting of delegates at which an International Committee was formed, it having been decided at the preliminary meeting of delegates on July 1st to constitute the Congress a triennial one to be held in different countries.

A New Medical Carbon Arc Lamp.

Dr. A. Stein (Wiesbaden) before Section II (Electrotherapy and Actinotherapy) on July 2nd gave a description of a new type of medical carbon-arc lamp. He stated that following the work of Finsen and the treatment of disease by means of ultra-violet rays, it had been thought that these were the only active therapeutic agents in heliotherapy and that therefore the lamp that emitted no other rays must be therapeutically the best. Careful experiments and observations by a large number of modern practitioners, however, had led to the conclusion that not only the ultra-violet rays, but also some others, particularly the infra-red, were most effective as therapeutic agents.

Starting on these premises, therefore, Dr. Stein said that he set to work to find new sources of artificial sunlight which would resemble natural sunlight to the greatest degree. In his opinion the light produced by the passage of an electric current between two carbon points was far more similar to natural sunlight than that produced by quartz lamps; it was, he said, scarcely possible to produce a light that was less like natural sunlight than that of the mercury vapour quartz lamp. Taking, therefore, the carbon arc lamp for this purpose, the author set himself the two problems (1) of so arranging the lamp that the rays emitted by it should resemble as nearly as possible, in their spectral composition, those of the sun, and (2) of rendering the greatest possible percentage of the total energy set free by the arc between carbon points available for heliotherapeutic needs. So far as the first proposition was concerned, this had already been accomplished experimentally by mixing certain metallic salts in the points of the carbons. In this way it had been found possible to approach natural sunlight to a remarkable degree, although to repeat natural sunlight in every particular seemed almost impossible. In the lamp which he described, however, he claimed to have been successful in imitating natural sunlight to as great an extent as present-day knowledge permitted. The second proposition had been met satisfactorily by placing the two carbon points in parallel, a method never yet adopted for such radiations in heliotherapy; the idea of placing two carbons in parallel, of course, was not new, this method having been adopted as long ago as 1876 in the Jablochkoff candle.

Although this new lamp, which had been named the "Jupiter" lamp, was extraordinarily rich in ultra-violet rays its principal efficiency lay in the infra-red portion of the spectrum. It was not disputed that the ultra-violet rays set up an inflammation of the skin, but the great advantage claimed for the Jupiter lamp was that this could be avoided. One form of lamp was shown in which there were two pairs of parallel carbons, and thus a double arc. Both the pairs of carbons were placed inside a hemispherical aluminium reflector, which could be left open in front when general radiation was required, or partly closed with a funnel-shaped adapter for small local radiations. This lamp worked at 10 amperes and gave 6,000 c.p. The resistance necessary for the satisfactory working of the lamp was in a small case fitted at the back of the reflector. The lamp was so arranged, also, that it was adaptable for 110, 120, or 220 volts, a.c. or d.c. Other models of the lamp were demonstrated. A curious feature was that the gases emitted by these arc lamps had a certain therapeutic value, especially in cases of high blood pressure. No regulation of the carbons was necessary during burning, and there was an automatic arrangement which extinguished the lamp when the carbons had almost burned out, in order to avoid damaging the metal parts. The lamps were said to have been tried by a large number of German physicians with great success.

A New X-ray Tube.

A new metal X-ray tube for radiography and therapeutics was described to the Physics Section on July 2nd by Dr. A. Bouwers, physicist at the Philips Lamp Works in Holland. The metal wall of the tube consists of a chromium-iron alloy capable of being readily sealed to the glass and retaining a perfect vacuum. The heat conductance of this metal is so very small that it can be made red-hot at one end without injuring the seal at the other end. An incandescent kathode filament is placed within the metal vessel which has a circular opening, at a very short distance from which an insulated electrode is mounted, serving as an antikathode. The electrons are drawn towards the antikathode through this opening. Thus a sharply-focused spot is produced, the diameter of which depends upon the size of the opening which serves as an electron diaphragm. The X-rays issue from the antikathode at right angles through a window. The rays which do not emerge from the window are absorbed by metal protective walls of lead and brass arranged round the tube inside the chromium-iron casing, hence the tube can be used without any further protective devices. It is claimed that this type of tube, in addition to the general advantage of complete protection without external aids, also has an increased output as compared with the usual X-ray tubes.

The metal-encased tube has been developed in several types for various purposes, and such tubes are said to have worked perfectly satisfactorily for three years.

(To be continued.)

Power Companies' Costs and Charges.—In a letter to the Editor of *The Times*, a correspondent gives some interesting figures of the production costs of and the charges made (as published by the Electricity Commission) by 20 electricity supply companies, 10 provincial and 10 London, for the year 1922-23. The figures are as follows:—

Undertaking.	Total costs including interest.	Average price obtained.	Surplus
Provincial Companies:—	d.	d.	d.
Newcastle	0.74	0.76	0.02
Clyde Valley	0.66	1.02	0.36
Yorkshire	0.72	1.05	0.33
Lancashire	0.55	0.95	0.40
Mersey	1.08	0.79	0.29*
South Wales	1.07	1.09	0.02
North Wales	1.38	0.99	0.39*
Scottish Power ...	0.77	1.29	0.52
Fife Power	0.76	1.22	0.46
Shropshire, Worcester, and Staffordshire ...	1.12	1.49	0.37
London Companies:—			
County of London ...	1.78	3.44	1.66
City of London ...	2.43	3.95	1.52
Metropolitan	2.74	4.34	1.60
Charing Cross	2.52	4.04	1.52
St. James' & Pall Mall	2.80	4.08	1.28
Westminster	2.51	3.45	0.94
London	1.30	1.89	0.59
Brompton	3.24	5.28	2.04
Kensington	3.48	4.58	1.10
South London	1.68	3.53	1.85

* Deficit.

Czecho-Slovakian High-pressure Boilers. — Increasing attention is being devoted to the construction and use of high pressure steam boilers in Czecho-Slovakia. The Witkowitz Mining and Ironworks Co., of Witkowitz, has recently completed a battery for a Mahrisch-Ostrau concern to work at a pressure of 40 atmospheres and at a temperature of 400 deg. Celsius, and also one for its own collieries to work at 100 atmospheres and 490-500 deg. C. The last-named boilers are arranged to be fired with coke-oven gas, but may later be adapted to use pulverised coal.

Electricity at the Royal Agricultural Show.

Practical Demonstrations of Electrical Methods of Farming.

(*Concluded from page* 129.)

THE many electrical exhibits at the Royal Show at Chester, at which an important Conference on Electro-Farming, convened and arranged by the Agricultural Sub-Committee of the British Electrical Development Association, Inc., was held under the chairmanship of Lord Bledisloe on Wednesday, July 8th, proved of wide interest. Vistas of new possibilities for the application of electricity in agriculture were opened to the uninitiated, and it will not be inopportune to generally review some of the exhibits which attracted the attention of large numbers of visitors.

Scattered among the regular lines of agricultural implements were some thirty new inventions or improvements which had been entered for the Society's silver medals. Of these the new 12-h.p. wind-power plant, complete with a 5.5-kW. d.c.

Fig. 1.—Chester Corporation Tent and Transmission Line Exhibit.

generator, and a 58-ft. tower by Messrs. Young, Osmond and Young, of London, attracted much interest. This was undoubtedly the best electrically-equipped stand. It showed a 40-kW estate and farm power plant, comprising engine, generator, switchboard and battery, in conjunction with a kibbler, churn separator, milking machine, &c. An interesting feature of this stand was an electric tractor with caterpillar tracks. The device is designed to have almost the same freedom of movement as the ordinary oil tractor; a length of cable is employed, and is paid out or wound up according to the posi-

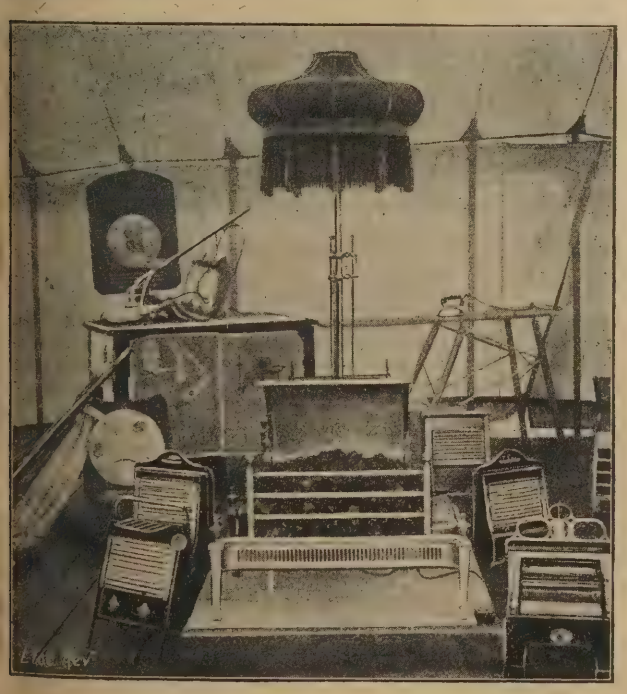

Fig. 2.—Part of the Corporation Exhibit.

tion of the tractor. This machine is to undergo practical field trials after the Royal Show. An improved electric crop dryer, in which the air is heated by means of self-contained electrical elements and blown into the stacks by means of an electric fan, was an important exhibit on this stand.

The Delco Light Co. exhibited an extensive range of electric light and power plant, including small generating sets, varying in capacity from 600 W to 1,250 W. "Frigidaire" electric refrigerators were also shown; the "Frigidaire" cooling coil is said to be equivalent to a 200-lb. block of ice, but maintains a temperature well below 50 degrees below zero.

Electricity in the homestead was demonstrated by the Chester Corporation, whose exhibits were housed in a tent 40 ft. by 20 ft. There were exhibits demonstrating the use of electricity for lighting and heating, "Hotpoint" cooking and ventilating; Beatty & Hurley washing machines, vacuum cleaners, boilers, ironers and other domestic apparatus, were also exhibited. Fig. 4 shows an electric fire which commanded great attention. Of outdoor apparatus there were churns, sterilising plant for the dairy, electric refrigerating plant, water pumps, barn machinery, an electric hay-chopping machine, a milk-separating machine, a churning machine, a sheep-shearing machine, a milk-cooling appliance, and a steriliser and water

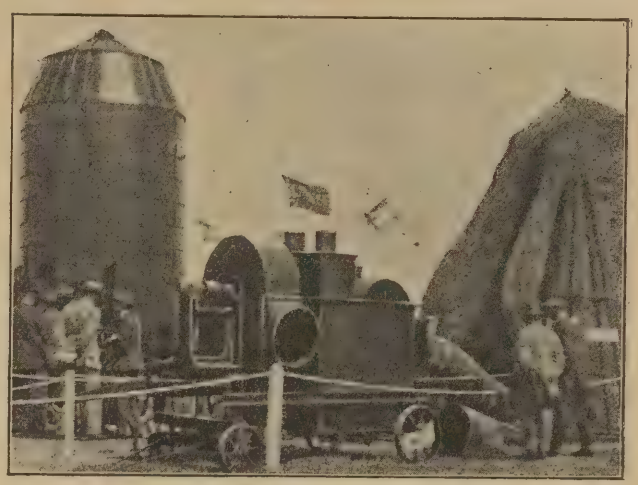

Fig. 3.—Electrical Crop-drying Plant.

pump. The tent was surrounded by a practical demonstration of the construction of a 6,000-V overhead transmission line, with a 6,600/400-V transformer, &c. Fig. 1 is a view of the tent and part of the transmission line.

At the stand of the Institute of Agricultural Engineers Oxford University, electric power was used for driving a blower, fig. 2, which forces hot air into a stack of green material, such as grass or cereals, for the purpose of artificial drying. The power required for this purpose is in the neighbourhood of 20 horse power.

Dynamo exhibits were displayed on seven stands. Various types of oil engine-driven electric lighting sets were shown by Messrs. Petters, Ltd., of Yeovil, including the "Alpha" Petters lighting set consisting of a 1½-b.h.p. petrol-paraffin

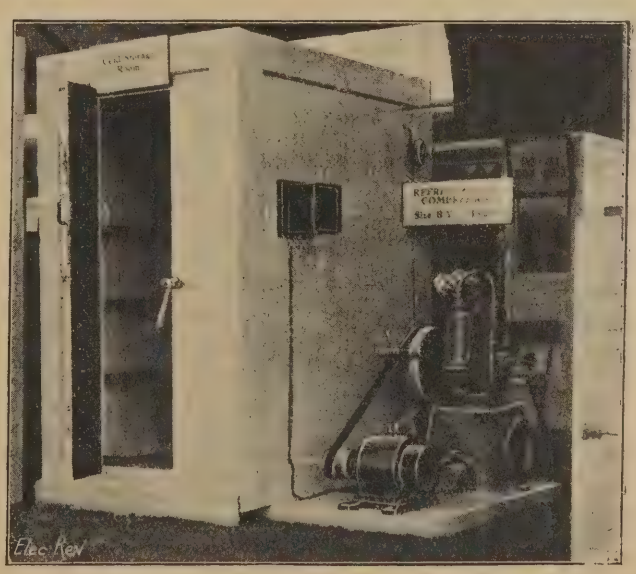

Fig. 4.—Cold Storage Equipment.

engine, dynamo and switchboard; and a 5-b.h.p. oil engine, dynamo, and switchboard set. Messrs. Blackstone & Co., of Stamford, had a big stand fully equipped with agricultural implements, including a spring injection heavy-oil engine directly coupled to a dynamo for supplying energy for general farm purposes. An electric lighting set, consisting of a dynamo belt-driven by a 2½-b.h.p. "Eagolyte" engine, for fifteen lights and upwards, was demonstrated by the Eagle Engineering Co., of Warwick, whose general exhibits were very comprehensive.

The Glasgow Electrical Engineering Company, Ltd., showed

a windmill electricity generating plant complete with a 22½-ft. mast, switchboard and battery. Although gas engines were the main point of appeal at the stand of the National Gas Engine Co., Ltd., a small vertical engine was demonstrated, working a small dynamo, whilst a horizontal unit, 4 b.h.p., was exhibited driving a heavier type of dynamo. To operate a mechanical lubricator of three types, the Vacuum Oil Co. employed a ¼-h.p. electric motor on a demonstration table.

Messrs. Bamfords, Ltd., had on view over 60 farming devices, including a 1-kW lighting set driven by a 2½-h.p. oil engine. Another well stocked exhibit was that of Messrs. R. A. Lister and Co., who showed a 100-V, 4-kW "Lister Bruston" lighting plant; a 1.5-kW direct-coupled Lister lighting set, complete with switchboard and stand; and a 1-kW belt-driven unit with switchboard, battery and rack. Messrs. Lister had a big range of dairying utensils on view.

Electric lighting plant of several types formed part of the composite display of Messrs. Boulton & Paul, Ltd. Interesting exhibits included an electric lighting plant, 1.5 kW, running on paraffin fuel, supplying energy for electric irons, churns, washing machines, &c., with a pulley for driving other

Fig. 5.—Cream Separators and Churns.

machinery; a petrol belt-driven 1-kW lighting set with a controller switchboard, suitable for an installation of 50 lamps; and a paraffin driven 4-kW electric lighting plant, suitable for power and lighting purposes for large country houses and farms. The Singer Sewing Machine Co., Ltd., demonstrated on the Corporation supply, twelve sewing machines of various sizes requiring from 45 to 200 W.

Amongst the standholders who employed electricity supplied free of charge by the Chester Corporation for the purpose of lighting, fans, and heating, were Reade Bros. & Co., Ltd., veterinary requisites; Polienta Co., Ltd., cattle medicinists; Spillers, Ltd., animal and poultry food merchants; agricultural information bureau, fertiliser stand, the British Sulphate of Ammonia Federation; Sutton & Son, seed specialists; J. Carter & Co., seed specialists; Gartons, Ltd., seed specialists; Zacharias & Co., waterproof makers; T. Grayson, Ltd., milk churn; Tangyes, Ltd., engines; the Sun Insurance Co.; the *Daily Mail*; Hewthorn & Co., veterinary preparations; Mappin & Webb, jewellery; Calthorp Bros. and Co., cattle food makers; Olympia Oil & Cake Co., Ltd.; W. Cooper; Nephewes, Ltd., veterinary preparations; Allied Newspapers, Ltd., heating and driving linotype machine; the Albion Cake Co., cattle foods; Charles Jones & Co., farm implements; Roger Errington, veterinary preparations; the ambulance room; fire station; the president's apartment and the secretary's office.

American electrical plant was exhibited by the Kohler Co., of London, which directed attention to automatic electric lighting and power plant, including the Kohler model D, 1,500-W, 110-V, d.c. set, with a 4-cylinder, water-cooled, combined engine; and the model S, 800-W, 110-V, d.c. automatic generator, with a 2-cylinder, air-cooled engine.

Lighting sets of 1½ and 3 h.p., operated by oil engines and equipped with 16-120-Ah batteries, made by Fuller's United Electric Works, of Chadwell Heath, were among the features of Messrs. Fairbanks, Morse & Co.'s exhibit.

The Haslam Foundry & Engineering Co. employed a 3-h.p. electric motor to drive a compressor for a cold storage refrigerating plant. Messrs. Watmough's, Ltd., showed the utility of the electric drive for grinding, crushing and pulversing corn and any other material, for which a 3-h.p. motor supplied adequate power. The Vigzol Oil Refining Co., Ltd., employed a ½-h.p. motor to drive an oil-refining plant. Using a 15-h.p. motor, Messrs. J. Harrison, Carter, Ltd., of Dunstable, demonstrated the operation of a cake crusher and a combined elevator and disintegrator for corn, food stuffs and fertilisers, having an output of 5 sacks per hour.

Of the fifty exhibits on the stand of Harrison, McGregor and Co., Ltd., several were shown in operation. For instance, a 3-h.p. motor was seen belt-driving a stationary binder, and a 15-h.p. motor propelling a countershaft from which was driven a complete set of barn machinery: this included a combined grinding and crushing mill, grinding 8 to 11 bushels, and crushing 25 to 30 bushels per hour; a chaff-cutter of 12 to 15 cwt. per hour capacity; a root cleaner and pulper, 4 to 5 tons per hour; and a double roller cake mill, 30 to 35 cwt. per hour.

Martins Cultivator Co., Ltd., had in service a 10-h.p. motor driving two swarth turners, a potato digger and combined side rake, a swarth turner and tedder, and also a ½-h.p. motor driving a rotary pump. To drive a corn mill with a capacity of 3 to 3½ sacks per hour, Messrs. Barford & Perkins, whose stand was well stocked with various farm implements, used a 5-h.p. electric motor.

Grinding machines were the speciality of Messrs. W. S. Barron & Sons, Ltd., of Gloucester, who demonstrated a 15-h.p. motor, belt-driving a countershaft from which was operated a geared impact grinding machine, and a 36-in. "Dreadnought" grinding mill; another 15-h.p. motor was direct-coupled to an impact grinding machine. Messrs. Robert Boby, Ltd., exhibited two motors, ¼ h.p. and 1¼ h.p., directly coupled and belt-driving respectively—in attachment with refrigerator compressors. Fig. 3 illustrates one of the compressors and the cold storage equipment.

The value of electricity to the dairy farmer was exemplified by Messrs. G. Llewellin & Son, of Haverfordwest. They showed a ¼-h.p. motor driving a 35-gal. separator and a similar motor driving an 18-gal. churn. The De Laval Chadburn Co., Ltd., exhibited a vacuum pump for a milking machine capable of dealing with the product of 40 to 60 cows. Fig. 5 shows some electrically-driven cream separators and churns.

An electric-driven flour milling machine of the latest type sextuble plansifter (for dressing flour), was the feature of outstanding interest at the stand of T. Robinson & Co. Messrs. Dawson Bros., Ltd., Gomersal, demonstrated an electrically-driven bottle-washing machine; this machine automatically soaks, brushes inside and out, rinses and sterilises 1,000 bottles per hour. The power unit also operated a milk bottle filling, measuring, and corking machine, capable of dealing with 160 dozen bottles per hour. To the Melotte Separator Sales Co., energy was supplied for four 1/5-h.p. motors, each direct-coupled to milk separators, dealing with 40 to 72 gallons of milk per hour according to size, one of which was demonstrated. Vaccar, Ltd., employed a 3-h.p. motor to drive a vacuum pump for a milking machine capable of dealing with 40 cows. The purpose of an installation driven by a 7½-h.p. motor, of Messrs. Thomas & Bishop, Ltd., was to depict good and bad belting. Messrs. W. H. Smith & Son showed a 3-h.p. motor, belt-driving a bottle-washing machine.

A model house (furnishing exhibit) by Richard Jones & Co. was equipped with electric lighting, kettles, cooker and irons. The electrical installation of this stand was supplied by Messrs. Williams, Gamon & Co. (Kaleyards), Ltd., Chester.

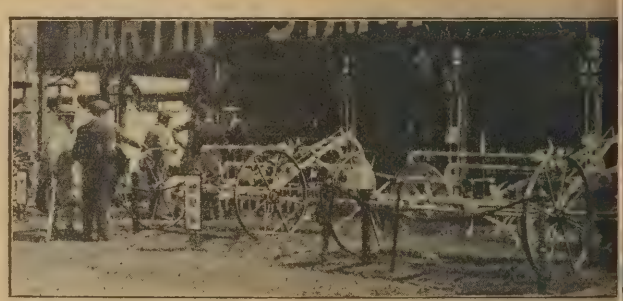

Fig. 6.—Electrically-driven Agricultural Implements.

The stand of Messrs. Ransomes, Sims & Jefferies, Ltd., Ipswich, was of unusual interest, showing as it did, self-contained electrical appliances and devices supplied from the Corporation mains. On view were a 20-b.h.p., d.c. motor mounted on wheels, for agricultural purposes; and a 15-h.p. motor belt driving a "Homestead" complete thrashing and finishing machine, capable of dealing with 45 bushels of wheat per hour, 50 bushels of barley, or 70 bushels of oats.

The only electric truck on show was that entered by Messrs. W. Goodyear & Sons, Ltd., of Dudley.

Fig. 6 shows some of the electrically-driven agricultural implements.

Petrol Tower Wagon for Tramways Department.—The Tramways Department of the Exeter Corporation has recently acquired a petrol motor tower wagon from the Associated Equipment Co., Ltd. The basis of the vehicle is a standard A.E.C. 28-h.p., 2-ton chassis. The tower, which is mounted immediately in the rear of the driver's cab, is built in two sections, one portion rising within the compass of the fixed section of the superstructure. A two-piece scaling ladder with iron sides and rungs is fixed on the near side, and as the tower is elevated it carries with it the ladder extension leading to the platform. The latter is so constructed that it can be turned in a complete circle and locked in any position in such a way that complete stability is ensured at its maximum elevation of 22 ft. At the rear of the vehicle is a commodious locker in which tools and other equipment can be carried.

Short-Wave Radio Communication.

Long-Distance Achievements by Amateurs.

HITHERTO when discussing long-range radio communication it has been customary to assume the expenditure of kilowatts of energy and the use of wave-lengths of thousands of metres. The remarkable facts which have recently come to light, however, have caused students of the subject to take stock of the situation anew. That attention has in recent times been re-directed to short waves, *i.e.*, under 100 metres, is due to amateur experimenters having obtained surprising results over long distances with very small power, and the investigation of the new effects which have been recorded may influence future development profoundly.

The McMillan Arctic Expedition.

The development of the short wave, in the neighbourhood of twenty metres, undoubtedly appears to be the most important aspect of radio research at the moment and it is for this reason that particular interest attaches to the American McMillan Arctic Expedition which left America on June 20th. Accompanying the expedition is Mr. John L. Reinartz, whose name is well known to every radio experimenter for his pioneering work with short waves. The receiver circuit bearing his name, which is becoming increasingly popular in this country, remains one of the most efficient of short-wave receivers, despite the introduction of much-advertised new circuits of late. Hitherto short waves have been almost entirely neglected and the work of Mr. Reinartz with the Arctic Expedition will be an extensions of his research in this direction, for he has taken with him a transmitter designed particularly for the twenty-metre wave-length; the Expedition is equipped with three other transmitters, for 40, 80 and 150 metres respectively, and the seaplanes are equipped with telephony apparatus. Mr. Goyder, who has just left Mill Hill School (N.W. London) succeeded in maintaining communication with the expedition for some days just before it crossed the Arctic Circle. He used a 250-watt valve and a wave-length of 40 m., with a single-wire aerial and a Reinartz receiver. The explorers hope to reach a hitherto unexplored region of the Arctic and the enormous distance which will separate them from receiving stations in America will make the tests severe ones, even for the short wave-lengths.

The Ridley Achievement.

Concerning recent amateur communication with Australia in daylight, as a matter of interest, it is understood that such communication was first established by Mr. J. H. D. Ridley (G5NN station, London) operating on a wave of 18 metres. When the oscillation frequency of such a short wave is taken into consideration, due credit must be given for the stable operation of the Mullard 0/250 transmitting valve that was used (fig. 1 shows a similar type). It is 14½ in. long and 5 in. in diameter; its anode current-grid voltage characteristics are shown in fig. 2 and a special feature is the method of assembling the internal parts so that filament renewals may be carried out without disturbing the other electrodes and internal structure. The long re-entrant glass tubes at either end provide high insulation between electrodes and the grid lead is kept far away from the filament leads. Mr. Ridley used an input of under 200 watts to the plate and a special loosely coupled circuit. His aerial is 37 ft. in length and 30 ft. high, the counterpoise being 40 ft. long and 10 ft. above the ground.

Fig. 1.—A Mullard Transmitting Valve.

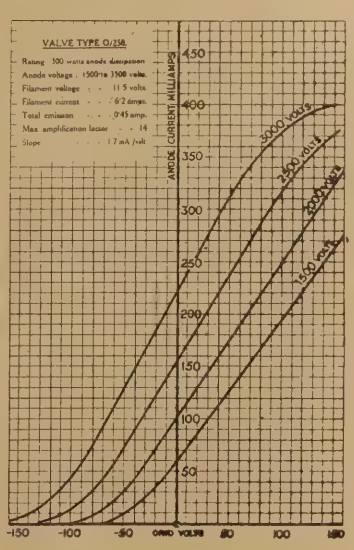

Fig. 2.—Type 0/250 Transmitting Valve Characteristic.

The message was received with the aid of a "low-loss" 2-valve tuner at 4.45 p.m. Melbourne time on April 26th, by Mr. B. Pringle, senior engineer on the staff of Amalgamated Wireless (of Australasia) Ltd., who logged all that was said about strength 6. It will be noted that the date precedes the transmission of 2OD (referred to below) so that Mr. Ridley has the distinction of being the first amateur operator to communicate with Australia on very short waves in daylight.

The Simmonds' Tests.

The recent achievement of Mr. E. J. Simmonds, the well-known amateur, in establishing radio communication between his Gerrard's Cross station (G2OD) and that of Mr. Maclurcan (A2CM) in Sydney, Australia, on a 20-metre wave is of interest for several reasons. On May 2nd signals were exchanged between 0552 and 0715 G.m.t., while on May 3rd messages were received and acknowledged for half an hour from 0520 G.m.t., the significant facts being that the short-wave messages travelled such a long distance when the whole of the path was in daylight and that they faded when darkness fell. In November last Mr. Simmonds established communication with Australia on a 100-m. wave, and he then found the signals were strongest and clearest during the hours of darkness. On May 17th, 18th, and 19th Mr. Simmonds communicated with New Zealand (NZ4AG) for the first time for three days in succession (wavelength, 22 metres) between 0500 and 0600 G.m.t., and it is interesting to note that these tests were accomplished with the aid of Marconi-Osram valves, the T 250 type (fig. 3) being used for transmitting and the D E Q type (fig. 4) for reception.

Fig. 3.—Marconi-Osram T250 Valve.

Fig. 4.—Marconi-Osram D E Q Valve.

The Marcuse Exploit.

Amateur experimenters met with such success last year that they are optimistically busy laying plans for next winter's work. Mr. Gerald Marcuse, who established communication with the Rice Expedition in Central America, recently established short-wave communication by telephony with the U.S.S. *Seattle* when she was 400 miles from Sydney, New South Wales. Mr. Marcuse first communicated with the ship by telegraphy; his signals were reported to be very strong, and he was requested to try speech. Despite bad interference at the Australian end, the speech was received well. Mr. Marcuse, who has quite a number of long-distance communications to his credit, including Brazil, Australia, and New Zealand, has recently added a modulating system and also an independent drive circuit to his transmitter in order to experiment with telephony. He uses Marconi-Osram valves of the T.250 type both for his modulator and main oscillator, and has found that the periods of audibility between this country and New Zealand are much greater on 45 metres than 90 metres.

Fresh Platinum Finds.—Reports of fresh discoveries of platinum come from the Pietersburg, Carolina, Waterberg, and Rustenburg areas. There is keen competition for farms, and the big groups are steadily increasing their interests.—*Financial Times.*

Electrical Development in Spain.

Important Water-power Schemes.

The British Commercial Secretary at Madrid (Capt. U. de B. Charles, C.B.E.), has forwarded a report* on the above subject to the Department of Overseas Trade. The report is dated March, 1925, and in the introduction it is stated that, apart from the poor harvest, the year 1924 showed considerable advancement. The wave of depression which has swept Europe has not affected Spain so seriously as other countries. The Moroccan problem remains, however, but it is considered that once this matter is settled the country should be in sight of the carrying out of a wide programme of development. The financial position of the State improved during the year 1923-24, and it was expected that the deficit would be still further reduced in the last financial year. With the possible exception of Barcelona there is very little unemployment in Spain at the present time. Labour troubles were few and far between during the period covered by the report, the only serious strike being that of the Asturias coal miners in November last which was settled in favour of the men. At the date of the report there was some talk of a metallurgical strike. Capt. Charles says that a feeling of stability and security has been established throughout the country.

Foreign Trade.

When the report was prepared the total figures relating to foreign trade during 1924 were not available. All that could be obtained was information regarding quantities imported and exported during the first six months of the year. Employing this as a basis of comparison it is observed that several important classes of electrical goods imported showed increases over the 1923 figures. For instance, the imports of dynamos, motors, transformers, switchgear, &c., during the first six months of 1924 amounted to 550 tons in the case of goods weighing from 1 to 3 tons and to 1,420 tons in the case of goods weighing upwards of 3 tons. In the first half of 1923 the quantities were 400 tons and 820 tons respectively. The share of the United Kingdom amounted to 100 tons in the first class and 65 tons in the second class. The imports of electrical measuring instruments rose from 47 to 95 tons (United Kingdom, 3 tons); electrical wires and cables, covered with textiles and exceeding 1 cm. in diameter, from 114 to 256 tons (United Kingdom, 124 tons), and aluminium cables from 6 to 165 tons. On the other hand imports of the following items decreased:—Insulators, from 500 to 240 tons; copper cables made of a wire of 0.5 mm. diameter or more, from 38,200 to 17,180 tons (United Kingdom, 17,000 tons); electric locomotives, from 380 to 80 tons; internal combustion engines, from 1,522 to 1,298 tons (United Kingdom, 223 tons); electric stoves, heaters, &c., from 41 to 18 tons; and accumulators, weighing 50 kg. or more, from 82 to 11 tons (United Kingdom, 1 ton).

Metal Production.

In the first nine months of 1924 shipments of copper pyrites amounted to 1,677,319 tons, as compared with 1,295,544 tons in 1923. The increase in output which commenced in 1923, after the signature by all European producers of an agreement under which output was adjusted to demand and selling prices raised to a remunerative figure, has been maintained, and many of the smaller mines have now resumed operations and the larger ones have undertaken development schemes. The high price of lead in the past year resulted in the re-opening of a number of mines which were practically closed down. In the Sierra Almagrera, the important lead district in the province of Murcia, pumping machinery is being actively installed and it is hoped to re-open the more important workings at an early date. The export of lead in bars during the first half of 1924 was 44,900 tons, as against 41,900 tons in the equivalent period of 1923. The increased output of zinc ore which was reported in 1922 was maintained in 1923, the exports of bars rising from 71,996 to 102,313 tons.

The increase in the use of electric power in mines and metallurgical works has been very rapid. The aggregate output of the motors installed in mines rose from 42,693 h.p. in 1922 to 59,472 h.p. in 1923. During the same period the aggregate power of electrical plant employed in furnaces, foundries and rolling mills, rose from 69,481 h.p. to 104,598 h.p.

The value of the finished copper output in 1923 was 60,639,678 pesetas, as compared with 34,915,337 pesetas in 1922. The equivalent figures for lead were 91,742,491 and 68,314,516 pesetas, and those for zinc 10,846,548 and 6,412,731 pesetas.

Hydro-Electrical Development.

The construction of water-power stations which had already been commenced proceeded slowly during the period under review, and there appears to have been little desire to embark upon any new hydro-electric schemes of importance. Only four undertakings were completed during 1924, *viz.*, a 2,000-h.p. development at Peñas de Castro on the Tagus for a cement factory, and three small stations (100 h.p. each) in the province of Guipuzcoa. Work is still proceeding on the Jucar River, where the Hidroeléctrica de Castilla has already expended 30 million pesetas on a station to develop 15,000 h.p. The plant of the Gallega de Electricidad on the Salto del Tambre (Galicia), which has cost 16 million pesetas, is nearing completion, and the Hidroeléctrica del Cantábrico is duplicating its 8,000-h.p. plant at Somiedo (Oviedo). The Hidroeléctrica Española has acquired the Tranco del Lobo falls, developing 3,000 kW, and has built a reservoir and provided an important reserve for its station at Molinar, which is lower down on the same river. The Sociedad Productora de Fuerzas Motrices has obtained further capital and formed a new company, the Sociedad Impulsora de Negocios Eléctricos, with a view to the further development of the hydro-electric resources of the Valle de Arán. In the Sierra Nevada the S.A. Tranvias Eléctricos de Granada has now opened the Durcal station which will supply power for the company's tramway and the new electric railway which has been opened from Granada to the Sierra. All the important power companies find it necessary to install reserve stations for use in the dry season. One of the most important recently constructed is the 15,000-h.p. steam station of the S.A. Electra de Viesgo, at Santa Cruz de Ujo (Asturias). This is capable of extension to 40,000 h.p. and will serve as a stand-by for the seven hydro-electric stations operated by the company. The steam station at Valencia of the Sociedad Anónima de Fuerzas Electrica, in which there are important British interests, was finished during the year. This has an output of 25,000 h.p., which will be distributed by a local co-operative society. It is reported that an agreement has at last been reached between two Spanish banks on the question of the much-disputed Douro Falls, which are estimated to be capable of producing 500,000 h.p., and it is hoped that the development of this important scheme will not be much longer delayed. There is also reason to believe that there is some prospect of working being commenced on the Alverche and Cafio Concessions (Madrid) in the current year. The approximate maximum water-power available is estimated at 6 million h.p. Concessions have already been granted in respect of over 4 million h.p.; 1,261,118 h.p. is in actual use, and 2,160,000 h.p. is under construction. At the close of the year water-power concessions were made subject to a number of special conditions. These include the requirement that Spanish plant and materials must be installed whenever they can be obtained. A recent Royal Decree designed to assist industry included a provision for compulsory expropriation in connection with hydro-electrical enterprises.

Railway Electrification.

A fair amount of railway electrification was completed during the year. The Puerto de Pajares section of the Norte Railway was opened for traffic and is said to be working satisfactorily. A new electrified line was opened between Granada and the Sierra Nevada during the year. This was built by private enterprise and links up a number of villages in the Genil Valley. The Granada Tramway Company has completed its line to Durcal, and a line from Durcal to Motril will probably be built later. The Bilbao-Santander Railway has obtained its shareholders' sanction to electrify the portion of the line between Bilbao and Algorta and tenders are to be invited immediately. The Ferrocarriles Vascongados has decided to electrify its line from Bilbao to San Sebastian. The work is to be supervised by an Italian engineer and the power will be supplied from a Diesel-engine station which is to be erected. Work is proceeding on the electrification of sections of the Transpyrenean Railway from Ripoll to Aix-les-Thermes.

On December 30th last the Gran Metropolitano de Barcelona opened to the public its line from the Plaza de Cataluña to the Plaza Lesseps. Further extensions will shortly be ready, providing two services of 3,600 and 4,500 metres respectively. Another company, the F.C. Metropolitano de Barcelona S.A., is constructing an underground railway at right angles to the above line, but it will be some time before it is opened to the public. In Madrid underground railway construction is also proceeding. In June, 1924, the Metropolitano Alfonso XIII opened the Sol-Ventas section and work is proceeding on two other sections. When this is completed there will be direct underground communication between the lines of the Madrid-Zaragoza-Alicante Railway and those of the Norte.

At the same time the development of the steam railways is proceeding and there is reason to believe that more than one British manufacturer has taken up the question of co-operating with existing Spanish factories, at any rate on the technical side, and in this way obtaining some share of the available business.

Methods of Business.

Capt. Charles says that the essentials of business in Spain can be summed up in two words—efficiency and adaptability. Although credit is absolutely indispensable to business in Spain, the danger of granting indiscriminate credits is, of course, greater during the depressed condition of some trades than in normal periods. Care is consequently necessary, but if the judgment of representatives of Manchester and other North of England firms with thirty years' experience is any criterion, Spain is one of the safest markets in Europe to-day if its peculiarities are studied. The language question is very acute; the knowledge or ignorance of Spanish often makes for a gain or loss of business. In spite of the high cost of British goods, Spain is certainly a potential market if British firms will only study and, what is more important, accept whenever possible, local conditions and requirements.

The Inquiry at Southend.

Submarine Diesel v. Steam Plant.

OL. T. C. EKIN, M.Inst.C.E., on behalf of the Electricity ommissioners, held an inquiry at Southend on July 14th into ie application of the Corporation for sanction to borrow 40,000 for new plant and works; £7,100 and £2,980 in respect excess expenditure on previously-sanctioned loans; and 25,000 for a.c. mains, converting plant, switchgear and trans-rmers. Mr. J. A. Lee, engineer-assessor, and Mr. H. ouglas, financial adviser, sat with Col. Ekin; Mr. R. M. ontgomery, K.C., appeared for the Corporation, and Mr. raig Henderson, K.C., represented Westcliff Ratepayers' Asso-ation and the Southend branch of the National Citizens' nion. Watching briefs were held by Counsel on behalf of rtain ratepayers, Mr. R. Birkett, the borough electrical igineer, and members of the Town Council. We are indebted the *Thameside Mail* for the following notes of the oceedings

Mr. MONTGOMERY, opening the case for the Corporation, said at a majority of the Council favoured engines made by essrs. Belliss & Morcom, Ltd., on the lines of the Ger-an submarine Diesel engines of the war period and that ajority wanted permission to borrow money for the purchase two of those engines and the regularisation of excess ex-nditure on previous loans. After answering questions put the chairman regarding the method of selling the output id the rating of the engines already installed, Mr. Mont-mery said that while the simultaneous load on the three ations of the Corporation during the winter 1925-26 would 7,056 kW, the total capacity was 7,860 kW, leaving a re-rve of 10.4 per cent. The aggregate of the simultaneous mands on the stations would be 7,199 kW. Opposers of the heme held that Mirrlees engines would be preferable, but e applicants considered it better to have engines of a type ith which the staff was acquainted. He showed that there as a net difference of about £2,500 in favour of Mirrlees gines, G.E.C. generators being used in both cases. The dif-rence would be reduced to £1,300 if the Mirrlees engines ere fitted with oil-cooled instead of water-cooled pistons. Mr. W. H. Patchell was called as the first witness. He gave as his opinion that the submarine Diesel engines at present use at Southend were entirely satisfactory. The Belliss gines would afford interchangeability and the raising of eam at the rate of 1 lb. per kWh from exhaust gases for e by the steam plant at the London Road station. Under oss-examination by Mr. Craig Henderson, Mr. Patchell ad-itted that he had not been given sufficient notice to enable m to make an exhaustive examination of the Corporation's bmarine Diesel engines. He agreed that for outputs above 0-kW a slower-speed engine was superior; and he also con-rred in a suggestion by Mr. Henderson that the Corpora-n would eventually have to scrap the Diesel plant and go in r steam plant, but would not state whether it would be tter to do this immediately. He pointed out that he was not ked to give advice on this point, but to choose between the o types of Diesel engines in question.

Mr. ROBERT BIRKETT, borough electrical engineer, was called d stated that the original submarine Diesel engines ere installed on his advice and he had later advised the pur-ase of more of these engines until the Corporation's electrical licy had been definitely settled. He was without question favour of the type of engine preferred by a majority of the uncil. He agreed with Mr. Patchell on the questions of terchangeability of spare parts and labour.

COL. EKIN asked for estimates of the running costs of the irrlees and Belliss engines respectively.

Mr. BIRKETT produced these, and said that eight tenders had en received. The two in question had been accepted because ey were lower in price than the others except one which as rejected because it came from a German firm. It was oposed on the advice of Messrs. Handcock & Dykes to install nverting plant at the Leigh and Thorpe Bay stations to enable rrent to be interchanged with the London Road station.

Upon the following day Mr. BIRKETT continued his evidence d admitted that labour costs amounting to about £1,600 had en incurred in cleaning engines which were supposed to be w, and that Messrs. Belliss & Morcom had been paid an ount of £300 for an exhaust silencer which was extra to e contract. He agreed that in 1921 he had stated that the w-speed land-type Diesel engine was superior to the sub-rine high-speed type and that steam was more reliable than her. He had not tried to provide Southend with elec-city plant on a piecemeal basis; he was still turning over his mind the question of turbo-alternators. In reply to a estion by Mr. Henderson, witness admitted that he had owed Messrs. Belliss & Morcom to remove a quantity of are parts from the London Road station although the order r the new engines had not yet been signed. Examined upon s attitude to a report by the late Mr. C. H. Wordingham on e future supply of electricity in Southend, Mr. Birkett ad-itted that while Mr. Wordingham's estimate of future con-mption had been too small, his own had been 1½ million Wh lower than that. He considered that the alternator ommended by Messrs. Handcock & Dykes was unnecessary present, although he would use it if he was compelled to so. He admitted that he did not like to have to work with e experts in drawing up specifications, and the Electricity ommittee allowed him to prepare the specifications for the two engines which formed the subject of the inquiry. He also admitted that by including a long list of spares, not considered necessary by the makers but which he deemed essential, he had increased the tender of Messrs. Mirrlees, Bickerton & Day from £26,148 to £27,693 (including E.C.C. generators). The lowest tender was put in by Messrs. Mirrlees, Bickerton and Day, who quoted £27,693 against Messrs. Belliss & Morcom's £27,916 (using Lancashire generators). He denied that he informed his Committee that he had given an undertaking to the Electricity Commissioners not to use two-cycle engines, but he did state, on the authority of a discussion in his office, that Messrs. Handcock & Dykes would not approve of two-cycle engines. Mr. Birkett said that he was not misleading members of the Council when he sent them a "confidential" letter urging the purchase of German submarine Diesel engines from a Gillingham firm, which it was intended that Messrs. Belliss and Morcom should re-condition for service. It was not his wish to say anything against the Mirrlees engine. He maintained that the German Diesel engines had done their work well.

Councillor JOHNSON, a member of the Corporation, said that he believed the existing plant to be the best that the town could obtain.

Mr. CRAIG HENDERSON, K.C., in opening the case against the proposed loan, alleged that there had been a want of candour in one item relating to the excess expenditure of £10,080; this item, "overhaul, &c.," accounted for no less than £2,500. This included £1,100 for rough labour. Although the work was to be carried out by Messrs. Belliss & Morcom, Counsel said that the past few years had shown that Mr. Wordingham had been right and Mr. Birkett wrong. The latter had persuaded the Corporation to buy submarine Diesel engines and nothing but these had a chance. They asked for a full and proper scheme to be put before the Commissioners; he wanted the Inspector to be thoroughly satisfied whether the figures put forward were reliable. Mr. Birkett had condemned the submarine Diesel engine in his correspondence with the Commissioners, but he tried to find fault with the low-speed machine without knowing what it could do. He had claimed that submarine Diesels could be quickly reconditioned and erected and yet it took 11 months and cost £1,100 for rough labour to do the job. After stating that Mr. Birkett objected to a supply from the County of London Company, Mr. Henderson referred to the manner in which Messrs. Handcock & Dykes were "dropped" when their reports were unfavourable to the Electricity Committee, and said that if it were left to Mr. Birkett the a.c. mains would never be laid unless he was overruled. The whole electrical policy of Southend was opposed to that of the Electricity Commissioners throughout the country; Southend was isolating itself from other districts because it had three separate stations which were not linked by h.p. cables. With regard to the tenders for the new engines, Counsel said that "English-made land-type Diesels" were stipulated, but when the minute came before the Council the words "English-made land-type" were omitted. The attention of the Corporation had never been drawn to the facts that there were lower tenders than that of Messrs. Belliss and Morcom, and that the Mirrlees engines had a lower fuel consumption.

Mr. A. H. DYKES, called as a witness, said that he had been asked to report on the undertaking. He had difficulty at times in obtaining information. After inspecting the Mirrlees engine he recommended its acceptance. He considered that this was a cheaper and better engine.

Mr. TOWNEND, of Messrs. Handcock & Dykes, said that he had interviewed a deputation from Southend at his office. He considered that it would be a backward movement for Southend to continue to use an engine based on the type made by the Germans in 1917. The Mirrlees was a modern engine.

Major W. V. WEBER, a member of the Council, then gave evidence and said that he objected, in the case of the first three submarine Diesels, to the town paying £5,500 each for engines that had cost £1,100 each. The Electricity Committee was always told that the engines were new and were wanted immediately, but it had always taken nearly a year to install them. Major Weber complained that the Committee was never given full information or reports of breakdowns. He said that Messrs. Handcock & Dykes's report had been disregarded and Messrs. Mirrlees, Bickerton & Day wrote and asked why their tender, which was the lowest, had not been accepted. This letter did not reach the Mayor until three or four weeks later; it was found in the office of the borough electrical engineer. He maintained that the Corporation was retarding electrical progress, and said it was time that the Commissioners investigated the matter. Major le Masurier, C.B.E., also gave evidence.

In conclusion, Mr. HENDERSON contended that Mr. Birkett had set himself out to flout the Commissioners; he asked the Commissioners to compel Southend to come into line with the rest of the country.

Col. EKIN said that before coming to a decision the Commissioners would have to seriously consider the electrical policy of Southend. They would not come to a decision on the matter until they knew what the views of the Council were in respect of the future. He declined to proceed with the second part of the inquiry until after the long vacation.

New Electrical Devices, Fittings and Plant.

(Readers are invited to submit particulars of new or improved devices and apparatus.)

A New Electric Block.

We recently saw the new electric block illustrated herewith, which is the latest product of Messrs. S. H. HEYWOOD & Co., LTD., Reddish, nr. Stockport, under test and giving favourable results. This machine, which is designed to give complete accessibility to all working parts, is constructed around a framework consisting of two cast-steel pan-shaped end plates rigidly connected by cross stays. The driving motor, fig. 1, is mounted on angle irons between the end plates,

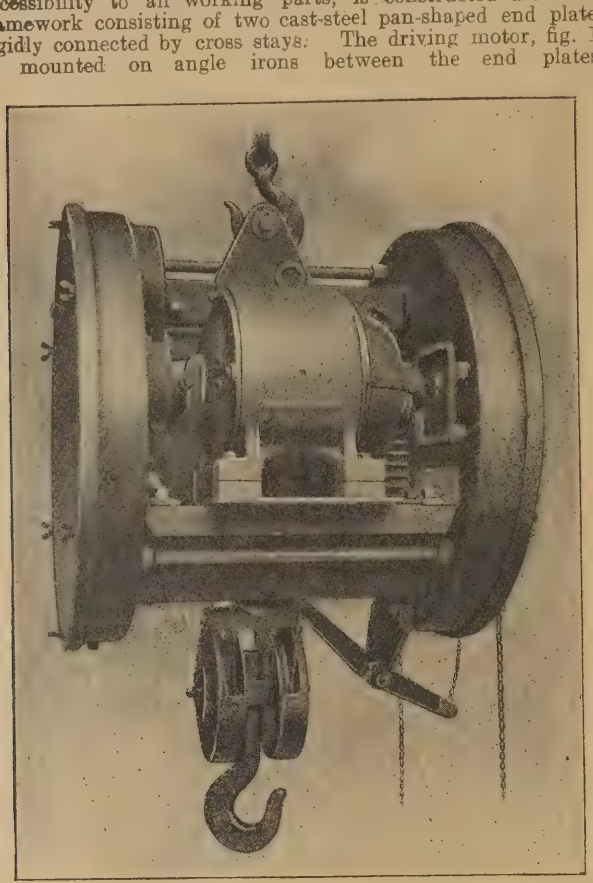

Fig. 1.—Electric Block, showing Motor Housing.

one of which contains the brake equipment, including the brake pulley, carried by one end of the motor shaft. This pulley is easily removable by means of a pulley-removing device of the usual type attached to the centre of it. The other end of the motor shaft carries the driving pinion housed in the opposite end plate. It can be readily removed by dismantling a grooved plate covering an aperture in the end through which the motor shaft with the pinion may be slid

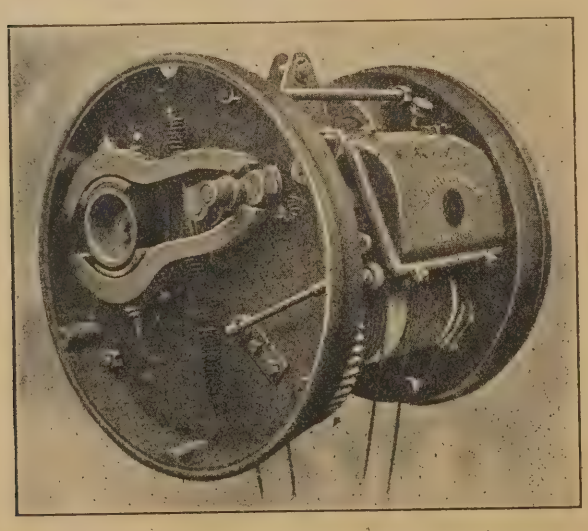

Fig. 2.—Electric Block, showing Brake and Controller.

with the motor from position, the end plate itself being internally cone shaped. The motor is of the standard "Hall" type.

The controller is of the drum type, and is situated on the opposite side of the frame, fig. 2. It has five positions other than the "start," and is operated by the usual chain and lever device. The resistances are carried in the opposite "pan," and are built on five cylindrical bobbins. The controller is totally enclosed, but every part is rendered accessible by means of a hinged door. The contact barrel is mounted on ball bearings, and the whole can be lifted from the bearin housings after a simple operation entailing the disconnectio of an extension of the barrel spindles, which carries a pinio affording the automatic operation of the brake. Arc shiel are fitted between all the fingers.

The automatic braking operation is effected by means cams engaging with rollers on the ends of the brake arm the cams being carried on a central spindle geared to th contact barrel shaft of the controller. The cam operati surfaces are so shaped as to give a uniform pressure increa during their operation. The brake shoes are lined with ha "Ferodo" fabric, and are suspended loosely about the pull from the brake arms, so as to ensure a uniform surfa pressure on the pulley. The equipment in both end chambe is completely encased by sheet steel covers, which are easi removed by means of thumb screws. The winding barrel mounted on a shaft supported between and by the two en cases. It may be removed bodily by withdrawing the sha through one of the ends. The barrel spur wheel is bolte by means of fit bolts to the barrel itself, thus eliminati the use of keys. The lubrication of all bearings is by scre down grease cups conveniently located outside the framewor

A Swiss Arc Welder.

Following a study of the phenomena of the electric arc produced between metallic electrodes, the SOCIETE DES ATELIE DE SECHERON, of Geneva, recently introduced portable alterna ing-current arc-welding apparatus which is claimed to gi satisfactory technical results, at least equivalent to those o tained with direct-current plant, and at a much lower fir cost, this being only about one-third of that of the d.c. outf The apparatus consists of a special static transformer t secondary voltage of which adapts itself automatically to t class of welding being done. A commutator regulated by hand wheel shows the current employed, the use of delica instruments being thus avoided. For use in erecting sho the coils may be wound to work with a.c. at 250, 380, 500 volts.

A "Flywheel" Motor Compressor.

Some interesting particulars are given in *Chemical a Metallurgical Engineering* of new type of air compress brought out by the CHICAGO PNEUMATIC TOOL CO., 6, East 44 Street, N.Y. This compressor uses a specially designed sy chronous motor, called the "flywheel" type, particula adapted to single straight line air compressor operation. T motor is designed with the rotating element outside the stat which is mounted in a cradle support bolted to the compres

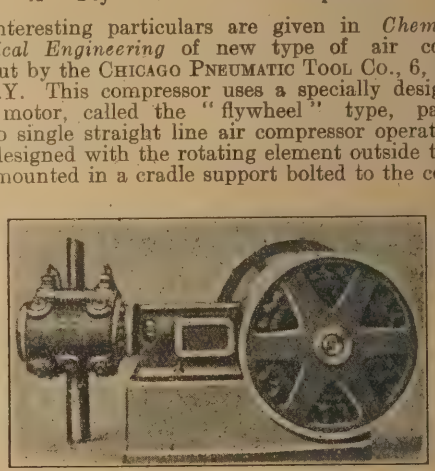

Fig. 3.—The "Flywheel" Motor Compressor.

frame. This support is bored concentric with the compres bearing to ensure alignment of the stator and a uniform gap when assembled. The rotor has the appearance of ordinary flywheel, the face being crowned for belting to exciter or other auxiliary. The poles are mounted on the in rim of this wheel. With this construction, the weight a consequently the cost of the motor have been greatly reduc

A New Shade Carrier Ring, Holder Lock and Flexible Gl

We have received from MESSRS. LAMLOK, LTD., 237, Ac Lane, Chiswick, London, W.4, a lampholder fitted with a n shade carrier so designed that the ring carries a sleeve, panded at the top end, which grips the shade. The act ring, with the usual milled edge, is at the bottom of the sle which is about ½ in. deep, thus allowing it to be adjusted the fingers in narrow shades which either necessitate the of a shade carrier ring remover or great inconvenience w the ordinary type of ring. The device also permits of mu quicker adjustment or removal, in that the ring is passed o a minimum number of the threads on the liner of the lar holder.

The holder also carries a locking device, consisting o threaded hole at one side of the top of the holder, into wh a pin is screwed which will engage with one of the side s in the porcelain. A flexible gripping nipple is also inc porated in the holder; this takes the form of a bush of in lating compound with a central hole through which the passes. It is screwed into the top of the holder from inside and when the holder is fixed, it is screwed down that the leads are gripped between the porcelain and the bottom of the bush.

Correspondence.

Correspondents should forward their communications **at the earliest possible moment.** *No letter can be published unless we have the writer's name and address in our possession.*

Special A.C. Rectifiers.

In answer to "Rectifier's" letter in your issue of July 17th, we may say that we are now manufacturing apparatus by which the necessary high-pressure required by wireless receiving sets can be obtained from an a.c. supply, which is laid on in many households.

We are supplying large numbers of these outfits, and customers are more than satisfied with the results they are obtaining. We may say it is possible by simple adjustment to so smooth out the current that no continuous note is audible in a loud speaker.

It will interest your readers to know that the whole arrangement is effected by transformers and condensers, and the apparatus is therefore entirely free from liquid and other objectionable features.

Gent & Co., Ltd.

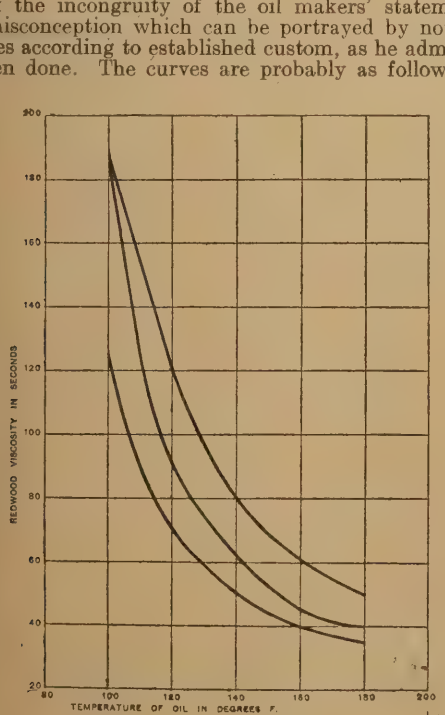
Leicester, *July 22nd*, 1925.



Lubricating Oil for Turbines.

As you have considered Mr. J. E. Stewart's letter dated July 2nd to be, as he suggests, of such importance to be published in your July 10th issue, I feel sure that a reply to the criticisms will not be out of place. I shall endeavour to deal with the points *seriatim*.

Mr. Stewart is under a misapprehension concerning the attitude of the turbine maker in his recommendation of lubricating oil. Final decision, it is true, is practically left in the hands of the turbine builder, as in the case of all other makers of machinery, because he is responsible for the well-being of the plant during the guarantee period. In most cases the process is simply that the oil supplier prepares an oil which he believes to be suitable and submits it to the turbine builder, who, if he thinks fit, tests it in a turbine, provided it conforms to the usual preliminary laboratory tests, which nowadays are fairly accurately understood and capable of interpretation. If the results of the running test are such as to commend themselves to the turbine maker, then the oil may be put on his list for recommendation. Thus, the decision is a dual one, and not one of shifted responsibility.

I am of the opinion that there are neither turbine builders nor turbine users who know any recognised turbine oil which does not possess a good temperature coefficient of viscosity, and I might go further and say that it is not customary to give the viscosity at one temperature only. The usual temperatures are 70 deg. F. and 140 deg. F., but when a third temperature is desired, it is usually taken at 100 deg. F. in the case of turbine oils.

The "curves" which Mr. Stewart gives are not really indicative of the incongruity of the oil makers' statements, but of the misconception which can be portrayed by not drawing the curves according to established custom, as he admits should have been done. The curves are probably as follows:—

which puts a very different construction upon Mr. Stewart's comments.

E. A. Evans,
Chief Chemist, C. C. Wakefield & Co., Ltd.

London, E.C.2.,
July 22nd, 1925.

We have read with interest the letter in your issue of July 10th of Mr. J. E. Stewart. We notice, however, that the statement is made therein that it is customary for oil manufacturers to give viscosity in seconds at one temperature only.

We cannot help thinking that Mr. Stewart's experience has been an unfortunate one as we believe it is the custom of most firms of repute to give viscosities at more than one temperature, it being well known to the oil trade that one temperature is by no means indicative of the quality of an oil.

The enclosed booklet issued by us on turbine lubrication may be of interest. We thank you in anticipation of your correcting a statement which, we think, may give rise to an altogether false impression as to the attitude of the oil trade generally. That there are certain firms which will wilfully withhold, either through ignorance or design, certain information is probably true, but this does not apply to any of the well-known houses, which are only too anxious, as a rule, to clearly state the merits of their products in such a way that the engineer or technical man can fully appreciate the quality of the article he is buying.

Sterns, Limited,
H. BELL THOMPSON,
Director and General Manager.

London, E.C.2, *July 24th*, 1925.

Parliamentary News.

[By Our Special Parliamentary Reporter.]

Carbon Electrodes. — On July 21st, Mr. O. NICHOLSON asked the Chancellor of the Exchequer why, seeing that American carbon electrodes were permitted to be imported into this country after payment of 33⅓ per cent. "Key Industries" duty without any additional deposit, an additional 20 per cent. was added to the 33⅓ per cent. "Key Industries" duty charged on carbon electrodes imported into this country from Austria.

Mr. CHURCHILL said he was informed that the values declared for the purposes of the assessment of key industry duty on carbon electrodes imported from Austria were considerably below those declared for similar carbons imported from America. The question whether the declared values of the Austrian carbons could be accepted was at present under consideration by the Commissioners of Customs and Excise, and, pending a decision, delivery of the carbons was being allowed on the deposit of a sum equal to the duty based on the declared values plus 20 per cent. of such duty. He understood that a decision on the question of value would probably be given at an early date.

Transmitting Radio Licences.—On July 21st, Captain W. BENN asked the Postmaster-General what scale of charges he proposed to lay down for transmitting licences under the new Bill; and whether he could give any undertaking that the scale would not be exceeded in the future.

SIR W. MITCHELL-THOMSON said that the fees for experimental sending licences were reduced some months ago, and the charges now made were an initial fee of 10s. and an annual fee of £1 where the power authorised did not exceed 10 watts, and an initial fee of £1 and an annual fee of £2 where the power exceeded 10 watts. The hon. member could not expect him to give a pledge that these fees would never be increased. He could give an assurance that no alteration was at present contemplated.

Unemployment Figures.—On July 22nd, Mr. BETTERTON Parliamentary Secretary to the Ministry of Labour, informed Sir F. Rice that the number of electrical wiremen, linesmen, and fitters on the registers of Employment Exchanges in Great Britain at June 1st was 6,937.

Wireless on Ships.—On July 22nd, Mr. B. SMITH asked the President of the Board of Trade, with reference to the Merchant Shipping (Wireless Telegraphy) Act Amendment Rules, 1925, issued on April 21st, 1925, whether he would seek powers which would enable the Board of Trade to require Class II vessels to carry more than one qualified operator, in the same way as he had secured powers to exempt foreign ships from the requirements of the Merchant Shipping Wireless Telegraphy Act of 1919.

SIR BURTON CHADWICK, Parliamentary Secretary to the Board of Trade, said he was not convinced that the alteration of the law proposed was necessary in the interest of safety of life at sea.

The London and Home Counties Electricity District.—On July 27th, Lt.-Col. MOORE-BRABAZON, Parliamentary Secretary to the Ministry of Transport, moved the approval of the Order made by the Electricity Commissioners constituting the London and Home Counties Electricity District, and incorporating the London and Home Counties Joint Electricity Authority. The Order was approved with slight modifications.

The Mersey Tunnel.—Further evidence has been heard by the House of Lords Committee, which is considering this scheme, during the past week, and it was expected that the hearing would be concluded during the week.

The Wireless Telegraphy (Explanation) Bill.—This Bill was read a second time in the House of Lords on July 27th.

Japan's Electrical Imports and Exports.

SINCE the earthquake in Tokio and Yokohama, which caused the destruction by fire of a quantity of the Government's statistical data, the Japanese import and export trade returns have not been issued in very great detail. It is, however, now possible to compare the figures for 1922, 1923 and 1924. The following table shows the values of Japan's imports and exports of electrical and allied material during these three years. It will be noticed that exports, except those of telephones and electric lamps, have declined progressively, whilst in 1924 imports of electrical machinery were unusually large.

Exports.

	1922. Yen (Thous.)	1923. Yen (Thous.)	1924. Yen (Thous.)
Insulated electric wire.—			
Total	7,816	1,609	1,373
To China	6,712	661	317
,, Kwantung	849	677	889
,, Hong Kong	164	63	91
Electrical machinery.—			
Total	3,028	1,851	1,755
Telephones.—			
Total	119	154	143
Electric lamps.—			
Total	1,244	1,335	1,829

Imports.

German Industry in June.—The Commercial Secret at Berlin (Mr. J. W. F. Thelwall) has forwarded to the D partment of Overseas Trade a review, based on the reports the Prussian Chambers of Commerce, of the commercial a industrial situation in Germany during June. He states t the position in the electro-technical industry was not unifor Where the general dearth of money was not immediately in view of the existence of a working balance, the influx orders was very brisk, particularly in the case of elect technical works and tramways, and it was endeavoured carry out improvements and extensions on a large sc Price increases for certain groups of apparatus occurred at beginning of the month. Foreign prices were also rais though with great caution and reserve.

The

Electrical Review

VOL. XCVII. AUGUST 7, 1925. No. 2,489.

THE OLDEST ELECTRICAL PAPER. ESTABLISHED 1872.

Published every FRIDAY, Price 6d.

Chairman: H. ALABASTER.

Technical Editor: A. H. ALLEN, M.I.E.E. *Joint Managing Directors:* G. H. ALABASTER. E. A. GATEHOUSE, M.I.E.E. A.M.INST.C.E. *Commercial Editor:* A. H. BRIDGE.

Manager and Secretary: E. S. MIDDLETON.

OFFICE: 4, LUDGATE HILL, LONDON, E.C.4.

Telegraphic Address "AGEKAY, CENT., LONDON," Code, A B C. Telephone Nos.: Central 8260 and 8261

The "Electrical Review" is the recognised medium of the Electrical Trades, and has by far the Largest Circulation of any Electrical Industrial Paper in Great Britain.

SUBSCRIPTION RATES, Postage Free: United Kingdom, £1 14s. 8d.; Canada, £1 12s. 6d.; Colonial and Foreign, £2 1s. 6d. per annum Cheques and Postal Orders (on Chief Office, London) to be made payable to THE ELECTRICAL REVIEW, LIMITED, and crossed "Midland Bank, Newgate Street Branch."

Statistical Co-ordination.

THERE are many things about Government Departments which are incomprehensible to the man in the street. Some of these are due to the apparent lack of co-ordination between the departments—each in its water-tight compartment seems to preserve its own individuality. That may in some cases make for good. To-day, however, when the truism "export or starve" is becoming a national shibboleth, it is important that we should be able to trace in every important industry the relation between external trade and direct unemployment in the industry concerned. Only by these means can we appraise claims for the protection which the Safeguarding of Industries Act is supposed to give.

At the outset, however, the student of statistics wishing to study the problem has to have recourse to two different publications—on the one hand, there are the monthly Trade and Navigation Returns published by the Board of Trade about the eleventh of each month, and there is also the Ministry of Labour *Gazette* which appears about eight days later. The former gives some 200 to 250 octavo pages to import and export trade—the latter gives about 10 foolscap pages to employment. In the *Gazette* there appear each month for 100 industries the numbers of insured persons unemployed during the third week in the month. The monthly percentage figures are based on the estimated number of insured persons engaged in each industry in the previous July.

Our readers are familiar with the form of the monthly import and export trade returns and their division as regards imports into thirteen classes of electrical goods and apparatus, and one class of electrical machinery, and as regards exports the same classes of electrical goods and apparatus, together with three classes of electrical machinery. If, however, they will expend the sum of sixpence on the Ministry of Labour *Gazette*, they will find that three out of the one hundred scheduled industries are as follows:—

"Electrical Engineering," employing 71,530 persons; "Electrical Wiring and Contracting," employing 12,850 persons; and "Electrical Cable, Wire and Electric Lamps Manufacture," totalling 74,940 persons.

Considering that each of the last two progressive industries, while important contributors to our export trade, differ widely in the values of their exports,* and

* For the three years ending December 31st last, "Electric Glow Lamps" averaged £347,547 per annum for exports, while "Electric Wires & Cables, Insulated," have averaged £4,038,018 per annum for export. As regards imports, "Electric Glow Lamps" have averaged £215,029 per annum and "Insulated Wires & Cables" £970,385.

differ even more widely in their nature in the materials and in the processes involved, we should have thought that the Ministry of Labour would have distinguished between these two trades. We note among the smaller trades such items as "Heating and Ventilating Apparatus," employing 5,760 persons, or "Wall Paper Making," with 5,480 persons. Yet a lumping together of these last two minor trades—or their relegation to "Other Industries and Services"—would be less open to criticism than combining lamps and cables (including those for telephone services!). Perhaps the Ministry of Labour will study a copy of the Monthly Trade and Navigation Returns—later, possibly they and (or) the Board of Trade, might issue for each month a comprehensive summary of the imports and exports of the commodities most nearly related to the main groups under which employment is catalogued.

Government Departments can, of course, reply: "Wait for the publication of the returns for this year under the Census of Production Act." We concede that this information—when we get it—will give us the whole story for one year. Then in another five years there will be another census. But in the changes of the intervening years, with the monthly ebb and flow of industry, it does not seem reasonable to treat the respective industries of cable and lamp manufacturers as statistically inseparable industries, and deal with them in this manner when recording changes in employment.

Independent Arbitration in Contract Disputes.

Well over twenty years ago we made a practice in these pages of summarising and commenting upon selected municipal corporation specifications and the conditions embodied in them for adoption by manufacturers submitting tenders. One of the main points upon which we repeatedly laid emphasis was the importance of contractors insisting upon provision being made for the settlement of any disputes that might arise between buyer and seller, by an independent arbitrator and not by the engineer or surveyor who was necessarily the servant of the purchasing party. The publicity that the matter received led to improvement, as some of our readers, at any rate, will recall. But whatever may have happened then, it is obvious from recent proceedings that things are far from satisfactory to-day, for one of the outstanding subjects in recent joint deliberations of the manufacturers' section of the London Chamber of Commerce and the Federation of British Industries designed to secure improved conditions in the municipal contract forms is this tendency which still persists for local authorities to stipulate that disputes are to be settled by one of their own officers. Early in the year the two organisations named interviewed the Association of Municipal Corporations and submitted proposals for the adoption of the principle of independent arbitration, and it is now announced that the Association recommends municipal authorities to accept that principle "so long as it does not involve the construction of the agreement or any question of law, and so long as it is made clear that pending the determination of the dispute the contractor is not relieved of his obligation to supply goods or in other respects to perform his obligations under the contract." Another point that came under attention in the conference related to quantities of goods and where purchaseable during the continuance of a contract. This and the question of independent arbitration are both conditions which the London Chamber and the F.B.I. urge tenderers to insist upon when submitting offers.

The German Stinnes Group.

In our issue of June 9th we referred to a declaration made by Dr. C. F. von Siemens, who stated that the Siemens and Halske Company, the Deutsch-Luxemburg Bergwerks Gesellschaft and the Electricity Works Company (late Schuckert), which are united in the community of interests of the Siemens-Rhine-Elbe-Schuckert Union, had never had any economic or financial connection with, or had any dependency upon, the firm of Hugo Stinnes or the Stinnes concern, and that the firm was solely a shareholder in the one or the other company, with the rights of any other shareholder. No information was given at the time by the chairman of the Siemens & Halske Company as to the extent of the shareholdings of the Stinnes group in one or other of the associated companies, but according to a message published in London from Berlin as far back as May, 1924, large realisations had already then taken place of the Stinnes interests in the Siemens & Halske Company and in other companies, so that it was then doubted whether the Stinnes estate was any longer the chief shareholder in these companies. It was added that just prior to his death, Stinnes was apparently hard pressed for ready capital, and that his heirs had had to realise quickly to keep the rest of the undertakings running.

Among the latest developments in connection with the Stinnes estate, prominence has been given in the German newspapers during the past week or two to the interests which the late Hugo Stinnes held in the Rhenish-Westphalian Electricity Works Company, of Essen, which was originally established by him many years ago as a customer for his pits on the one hand, and on the other for the supply of a great industrial region extending from Cleve and Emmerich, on the Dutch frontier, as far as Dusseldorf and Cologne. As a great pit bank undertaking, the works has gradually grown to be one of the largest of its kind in the world, the shareholders including many local authorities whose districts are supplied with energy by the company. In March, 1921, the company entered into a fuel delivery agreement with the Rodder Lignite Mine, and about the same time took over for 99 years the management of three of the Stinnes pits—the Viktoria Matthias, Graf Beust, and Friedrich Ernestine—the supply company guaranteeing to the collieries a fixed rate of interest, while the latter gave the former an option to acquire the shares, so that the pits in question might eventually become the property of the electricity company. Apart from the shares held by the Stinnes' subsidiary companies in the electricity works, the direct holdings of the Stinnes interests amounted to 12,000,000 marks out of the total capital of 140,000,000 marks, of which the local authorities are said to have owned some 52 per cent. As it has been deemed necessary to realise these direct interests, and as no single buyer has been able to come forward, the Government of Prussia has stepped in and acquired the shares at a price which is understood to be equivalent to about the par value. The participation of Prussia has been partly prompted by the desire to strengthen the electrical interests of the State in the Western provinces and to bring about close co-operation with the State-owned electricity works, especially that in Hanover.

Since the preceding lines were written, further developments have taken place. These include the sale to London and American firms of the Stinnes shares held in the mines and iron and steel works owned by the Deutsch-Luxemburg Co., at 13,250,000 marks for the shares of 21,000,000 marks. The various banks which have associated themselves together for the liquidation of most of the Stinnes assets, have also disposed of the shares of 5,000,000 marks held in the Siemens and Halske Co., and of those in the Berlin Handels Gesellschaft; the sites in Hamburg have been taken over by the State of Hamburg, and the Stinnes timber forests and shares in the Westphalian-Anhalt Explosives Co by the Prussian State, while the shares in the Barmer Bank Verein have been absorbed by other proprietors in that bank. All these transfers have had the result of redeeming about one half of the credits of 90,000,000 marks which had been granted by the banks down to last December.

The only comment which the situation of affairs seems to call for is an expression of surprise that it had been originally possible to obtain credit in so many quarters to take over and maintain large interests in such a num

ber of undertakings to which it was absolutely impossible for any one individual to devote the necessary attention. Horizontal expansion or the amalgamation of similar undertakings has proved of great advantage to various German industries, while the lines of vertical development, or the association of interests from the production of raw materials to that of the most highly finished manufactures, has also been of benefit when not carried too far. But there is no doubt that the promotion of the latter system to extreme limits and in the particular form adopted by the late Hugo Stinnes has brought about the downfall of the estate and the loss of a considerable amount of money.

Italy—a Difficult Market.

It cannot be said that the report of the British Commercial Secretaries at Rome, with which we deal in this issue, holds out any encouragement to British exporters. Indeed, we are inclined to think that the authors are perhaps too pessimistic regarding British prospects, for although this country's share of Italy's import trade fell slightly during the past year, we retained our position as the second largest exporter to Italy. The authors, however, probably take the view that if we do not continue to increase our trade we shall be left far behind, and there is truth in this. All of our chief competitors in the Italian market made headway in 1924; Germany wrested the third place from France, while the United States remained the chief supplier and Czecho-Slovakia nearly doubled her share.

The principal factor militating against British trade with Italy would appear to be the rapid strides which Italian industry is making. In the electrical branch, it is stated, Italy is capable of producing the majority of her requirements and is becoming less and less dependent upon foreign suppliers; Italian electrical manufacturers, moreover, are beginning to emerge as serious competitors for the business of other countries.

In the Italian market, as elsewhere, price is a stumbling block to British manufacturers, and this is where Germany secures her main advantage. The report points out that the Italians cannot afford to pay a high price for a superior article if they can obtain one not so good but capable of fulfilling its duties, at a lower cost. Some competitors show a disposition to cut prices after ascertaining the amount of British tenders.

Mention is made of the establishment of factories in the country by foreign groups and the acquisition of controlling interests in Italian firms for the purpose of obtaining business connections. In the face of these activities and of intensive German propaganda which is being carried on, British producers must continue their efforts to reduce prices to a competitive level, and to secure the interest of Italian buyers by a sympathetic consideration of their requirements. Personal contact is essential, and a real understanding can only be gained by representatives who have a command of the language.

Soviet Russia and Concessions.

In our recent leader on "Electrical Developments in Russia" (Elec. Rev., July 10th, p. 41) it was clearly shown that there was a growing appreciation that if the electrification of Russia was to proceed satisfactorily it was necessary to secure technical assistance from foreign works and to import more material from abroad. Subsequently it was reported that representatives were visiting this country for the purpose of expending considerable sums in the purchase of equipment and goods. A certain amount of business is being transacted in various ways at present, but it is a drop in the bucket compared with the requirements if electrification is to make headway. A *Reuter* dispatch from Moscow appeared in the London financial Press last week which credited Trotsky with views strongly favourable to the placing of concessions with foreign capitalist groups. He was addressing the German Labour Delegation with regard to Soviet "concession policy" and stated that the Government was more inclined than it was some years ago to "admit foreign capital to participate in the acceleration of the development of the technical and productive forces of the Soviet Union." He tried to impress capitalist groups with the advantage which they would derive by expressing a serious desire to acquire concessions. No doubt we have a long way to go before full recognition of past obligations will be forthcoming and therefore a long way to go before British capital will be prepared to run material risks, but the Trotsky attitude is worth noting as a straw showing which way the wind is blowing. The private property in Russia of British subjects is still considered as nationalised and confiscated. The Association of British Creditors of Russia in inquiring whether the Soviet Government's decree abolishing confiscation of private property is retrospective has reminded that Government that there are 500,000 individuals (company shareholders) who have been victimised and who will naturally be active agitators against any trading facilities being granted so long as restoration and redress are withheld. The Association holds, in common with the London Chamber of Commerce, the Association of Bankers and Credit Houses, and the Federation of British Industries, that "until Russia has settled with her creditors and thus restored confidence in her good faith, normal credit and industrial relations between the two countries cannot exist."

The Congress of Radiology.

Tentative suggestions for the holding of an international radiological Congress have been made from time to time; in fact, gatherings of radiologists have taken place, but they have not been truly international in character. British radiologists must, therefore, be proud of the fact that they were privileged to organise the first International Congress of Radiology, which was recently held in London. That the time was fully ripe for such a conference is evidenced by the attendance of nearly 500 delegates, representing no fewer than twenty-one nations.

A large number of valuable papers were read before the three sections—radiology, physics, and electrotherapy—the attendance being greatest in the first-named, and reference may be made to two constructive features: the first is that steps were taken to assist in the formulation of an X-ray unit of intensity which will be internationally acceptable, and the second is a recommendation that international agreement on X-ray and radium protection should be secured.

Amongst the new apparatus and methods described, the application of actino-therapy in the treatment of many diseases, such as tuberculosis of bones and rickets, is of special public interest at the moment; lamps for the production of violet rays, or artificial sunlight, are being improved, and rapid development in this direction is likely to take place in the near future. In X-ray practice, the most important development is probably the introduction of apparatus capable of producing current at constant high pressures up to 250,000 volts. Greater efficiency must follow the use of such devices, for they will not only increase the precision with which the radiation dose can be administered, but also reduce the exposure time, with advantage to the patients.

Industrially, X-rays have many possibilities; they are used for the detection of hidden defects in many substances, and it is now possible to penetrate 4 inches of steel. To power engineers, Mr. C. N. Kemp's work on the application of X-rays in the technology of coal would seem to be of special significance, and it may afford a ready means of examining coal before it is put on the market. Mr. Kemp also emphasised the importance of introducing technical radiology as a distinct science and of providing more facilities for teaching it. There must be many ways in which X-rays can assist industry. At the same time, however, the exhibition held in connection with the congress clearly demonstrated that X-ray apparatus at present is not in the state it should be in to enable definite decisions to be formed upon industrial problems. Moreover, the price of such equipment seems to be unduly high.

Industrial Illumination.

By C. T. PAYN.

Of the numerous applications of electricity, electric lighting is certainly the most widespread, for, with the exception of small towns and villages, it is to be met with on every hand.

Illuminating engineering is not wholly a matter of the selection and location of reflectors so as to throw the maximum light from lamps in some predetermined direction. An intimate knowledge of such other factors as glare, shadow, quality (colour characteristics), illumination of surrounding surfaces, and diffusion is necessary before a lighting system can be intelligently planned.

The proper illumination of our industrial establishments has become a matter of prime importance to the manufacturer, the workman, and the State; and success and efficiency are largely dependent upon it. Many factories still have conditions of illumination that are seriously injurious to the vision and general health of the operative. Bad illumination is *always* a poor investment, and results in dissatisfied workmen, spoilt material, and reduction of output. There is now no excuse for an inefficient lighting installation. The art of light production and illumination has been brought to such a state of excellence that an intensity comparable to that of daylight conditions in an average factory is easily attainable. It is peculiar that manufacturers will provide their employés with the best of tools and equipment, and yet forget that the final efficiency of the machine depends upon the efficiency of the individual workman who is seriously handicapped by poor light, adequate illumination being essential if the best is to be got out of him. Employers are generally aware of the danger to the eyes which exists from mechanical injury, but apparently they do not realise the insidious nature of the harm which accompanies poor lighting. Impairment of vision is a slow process, and may take months or even years before the individual himself becomes aware of it. Good lighting is an investment, not an expenditure.

Some manufacturers spend a considerable amount of money on their lighting installations, but it is not so much a case of spending money as of making the best use of what is spent. Much is wasted on brilliant lighting, ill-adapted to the particular kind of work which is being carried on. In many cases the lighting bill could be reduced by half, and still give more satisfactory results, if the installation had received careful attention in all essential details.

The planning of an industrial lighting installation requires a complete knowledge of all the modern methods and apparatus for the distribution of light. As in the case of a power installation, a complete set of wiring plans should be prepared showing the best methods of distribution to all parts of the building, location of main switch (or lighting switchboard), building risers, and position of fuse boxes. The last item is of extreme importance, and should receive careful attention. The distribution boards should be located as far as possible centrally with the load they are to supply, so that long runs are avoided, and voltage drop reduced to a minimum.

There has been a great deal of discussion on general *versus* local lighting, but the former is fast superseding the latter, and the reason is not far to seek.

The intensity of illumination is of as much importance as its distribution. The eye is able to adjust itself by the contraction and dilation of the pupil to suit a very wide range of intensities, and we are fortunately able to see and distinguish objects with equal ease under very different conditions. Nevertheless, limits exist, and therefore it is important to realise that artificial illumination may as easily fail by providing too much light as by too little. Although the eye can adjust itself to suit many intensities, it cannot be adjusted to suit two different intensities at the same time. Unless, therefore, the prime requirement of approxi mately even distribution is realised, the eye, as it turn from one direction to another, is obliged to adjust itsel to the new conditions. This not only produces fatigu and is injurious, but directly defeats the whole objec of the illumination. Generally speaking, we do no want to indulge in more light where we do use it, bu in more light where we do not use it—which i "General illumination."

General overhead lighting has a very wide applicatio in industrial work. It is usual to divide the ceiling o the shop to be lighted into squares (or rectangles a near a square as possible), and to locate a unit i each. Where machines are grouped, in certain area group lighting may be employed, and the units locate with respect to them. It is, however, far better to em ploy a strictly symmetrical arrangement, and to illu minate the entire shop uniformly so that adequat intensity is available, regardless of the disposition o the machinery. In a modern industrial installation re-location of entire departments is no uncommo occurrence. In assembly shops, benches are ofte located along the side walls, and for that reason it i

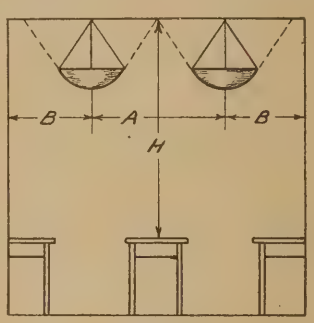

Fig. 1a.

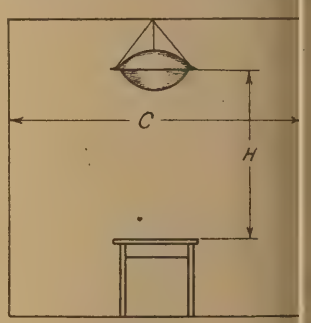

Fig. 1b.

advisable to locate lamps as near as possible to the walls It is particularly desirable for a given total wattag to employ the least number of units which will provid the best illumination, as not only is expense in wirin saved, but larger lamps have a higher overall efficienc *e.g.*, one 400-watt gasfilled lamp will give as much o even more light (light flux) than five 100-watt unit The problem, however, must be decided by the minimu number of units necessary to give uniform lighting an provide satisfactory illumination on both vertical an horizontal planes so that long, dense shadows will b avoided.

The following remarks will apply to all classes o lighting installations, and are the requirements gene ally met with:—

1. Sufficient light of uniform intensity on the worl ing surfaces—vertical or horizontal.
2. A comparable intensity on all surroundings—wall &c.
3. A light of suitable spectral character.
4. Light so diffused as to avoid objectionable shadow
5. Freedom from glare.
6. The *ensemble* to be in harmony with the surroun ings.
7. A suitable system of distribution which is reliabl simple and easy to maintain, the cost of whi is not out of proportion to the results.

All these conditions must be satisfied if efficie results are to be expected. This can be obtained by o or a combination of the three following systems i general use:—

1. Direct lighting.
2. Semi-indirect lighting.
3. Totally indirect lighting.

In selecting the system, the characteristics of the sh to be lighted must first be considered. If the work such that it is impossible to avoid large accumulatio of dirt and dust, and if the tone and colour of t

walls and ceiling are dark in colour, indirect or semi-indirect lighting is to be discouraged. The colour of the walls and ceiling can, however, be remedied by the liberal use of paint and whitewash.

A few additional points which must be borne in mind are:—

1. Objects are seen by the light which they reflect, and dark objects require a higher intensity than those light in colour.
2. At least 20 per cent. higher intensity than that actually required should be allowed for when designing indirect or semi-indirect systems to allow for depreciation, due to the accumulation of dust on the reflectors, lower efficiency of the lamp as it gets older, and darkening of ceiling and walls.

On investigation of an actual installation, the following figures were obtained. The installation consisted of semi-indirect units, a once white ceiling and walls, to a height of 5 ft. 6 in. from the floor:—

	Ft./candles.	%
Installation as it stood ...	3.5	100.0
After cleaning units ...	4.5	128.5
Adding new lamps ...	5.25	150.0
Re-whitewashing walls and ceilings	6.5	185.6

In the case quoted above, the ceiling was very dirty, but the figures are significant.

In a new installation for a large general office, an average intensity of 12 f.c. was aimed at, and 11 obtained with the actual installation. After six months the intensity was down to 8 f.c., so that the high figure at the start was amply justified.

The following is a description of an interesting experiment conducted in the Demonstration Room of the B.T.-H., and is quoted from the ELECTRICAL REVIEW, dated July 27th, 1923. The apparatus consisted of a small box in which a cylinder was caused to rotate at constant speed. Letters are printed on the cylinder so

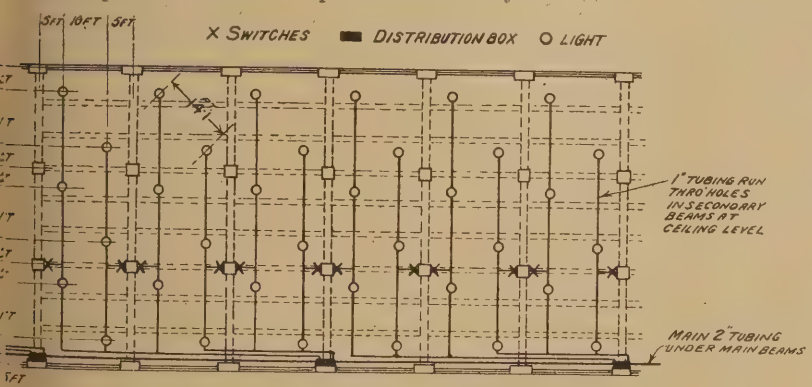

Fig. 2.

that they can be followed by the eye as it rotates. Lamps of various candle power were switched on at intervals, which produced the effect that the speed of the cylinder appreciably decreased as the illumination increased. This proves that the eye can see more quickly under high intensities. The article continues that the results of certain tests showed that production was increased by 10 to 25 per cent. with modern high-intensity lighting instead of the average standard.

Tables have been compiled from practical experience from which the spacing of the units can be determined. Table I has been used by the author, and has proved accurate in practice.

TABLE I.

System.	$\frac{C}{H}$	$\frac{A}{H}$	$\frac{B}{H}$
Indirect	1·30	1·50	0·6
Semi-indirect ...	1·15	1·50	0·6
Direct semi-enclosing ...	1·10	1·45	0·5
Direct	1·0	1·40	0·5

The meaning of the symbols can be ascertained from fig. 1.

The following is a brief description of an actual installation, in which the conditions are sufficiently common to warrant its description. As previously mentioned, the least number of units required to give a desired illumination should be used, but the proportions of the interior are very often such that consider-

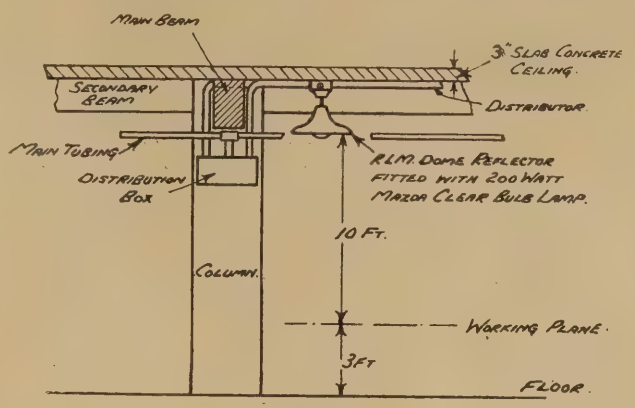

Fig. 3.

able planning is necessary. In this case the problem was that of 20-ft. square bays with deep main beams and shallower transverse secondary beams spaced 6 ft. 8 in. apart, with 1-in. diameter holes through them, as shown in fig. 2.

The correct position for the units was first ascertained, and plotted on the ceiling plan. Referring to fig. 2, the distance between the units (by calculation) is 14.1 ft. The nearest unit to the wall is 5 ft. 200-watt Mazda clear-bulb lamps of 191 m.s. c.p. were used. The reflectors, supplied by the Power Equipment Co., were dome-shaped polished enamelled reflectors (see fig. 3).

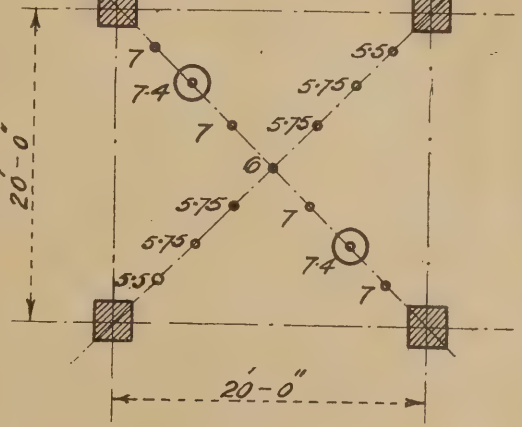

Fig. 4.

These were hung so that their edge was level with the bottom of the main beam; thus, unless the eye was cast directly upwards, all direct light from the lamps was cut off. The secondary beam, being only 1 ft. 1 in. deep, did not interfere with the distribution of light. Using Table I, it is found that such an arrangement gave the following ratios:—

$$A/H = 14.1/10 = 1.41 \text{ and } B/H = 5/10 = 0.5$$

This spacing being symmetrical and falling within the ratio limits, was adopted. As holes were left in the concrete beams 4 ft. either side of the main beams, the tubing supplying the lamps was run through them. If necessary, another unit (shown dotted) could easily be added, still retaining symmetry.

For distribution purposes the ceiling was divided into square sections of three bays long by three bays wide, a separate pair of feeders being run in the main 2-in. tubing under the main beams, which teed up into 10-way Parmiter, Hope & Sugden ironclad distribution boxes mounted on the side columns.

The photometer readings over one bay gave the foot-candle readings shown in fig. 4. The instrument used was a No. 167 Sharp-Miller photometer fitted with a No. 78B Wratten filter by Mr. Haydn Harrison, M.I.E.E.

The illumination thus provided was very satisfactory, free from glare, and shadows practically non-existent. The columns and walls were painted a dark green to a height of 5 ft. 6 in., thus avoiding surface glare on a level with the eye. The remainder of the columns and ceiling were whitewashed. The effect was pleasing and comfortable. In order to allow for extensions, all ceilling and through boxes were made 4-way, and spare outlets plugged. The switch lead, contrary to usual practice, was carried on and looped into each box in the run, so that in the event of partitions being erected, the lighting units could be shifted to suit the new requirements without disturbing the existing wiring. The unused switch-drops on the columns would be removed. The units were switched in groups of three. Throughout the installation standard material was used. All conduit, conduit fittings, and switches (ironclad) were supplied by Simplex Conduits, Ltd.; all fixing was made by means of Rawlplugs. Where necessary, the general lighting was supplemented by individual machine lighting.

In conclusion, a few words about "exterior lighting." Exterior lighting of industrial properties is required principally for the following purposes:—

1. The illumination of yards, thoroughfares, approaches, and passage-ways.
2. The identification and handling of materials stored out of doors.
3. The protection of buildings and materials against theft.
4. The guarding of boundaries against unauthorised persons.

Safety demands that any area which an employé is required to traverse after dark be adequately lighted. The requirements are more severe than for average street lighting, inasmuch as in emerging from a brightly-lighted building into the darkened area, the eye does not accommodate itself immediately to the lower intensity, and difficulty is experienced in seeing if this change is too great.

For this type of lighting the matter of shadows is of extreme importance, and deep, dense shadows must be avoided at all costs. If night work is carried on at all extensively in the yard, the intensity of illumination should be equal to that given for similar work in the building itself. The amount of light to be used as a protection for the building depends upon the importance of the property. A far greater use could be made to-day of flood-light projectors suitably erected on the angles of buildings. For general application, units having a beam spread of 30 degrees are most suitable. The ideal condition to be aimed at is a square space lighted by four flood lights, each unit so erected and trained that it covers the whole area; thus, even illumination is obtained, and shadows are eliminated. There is also the advantage of being able to focus the units on any desired spot, or to sweep surrounding areas.

The dome-type reflectors adapted for outdoor use are quite efficient, and give excellent protection from glare. Their cost is low, and except for occasional cleaning their upkeep is nil. These should be mounted not less than 15 ft. above the ground, and spaced apart about four or five times the mounting height. It is always preferable to increase, as far as possible, both the height and intensity of the unit. The ordinary cosine method of calculation of the intensity will be found sufficiently accurate in determining the illumination in foot-candles, which for general yard lighting should be between 0.25 and 0.75 foot-candles.

In conclusion, there are many classes of the public which have much to do with lighting, but understand little about it, and it would certainly be advantageous if the importance of the subject could be brought vividly before them, particularly in the education of works managers.

It is essential that better lighting should be used and that the industry and the public should understand the principles of good lighting, and recognise the standards of intensity which are adequate and suitable for various purposes. Possibly much that has previously been written has been of a too technical nature to interest those not engaged in the industry. It is hoped that this article will prove beneficial both to employer and employed.

Testing the Boiler.

By "STAN DARD."

The new turbo-alternator had been duly tested and accepted,* and some weeks afterwards word went forth to the testing engineer that a representative boiler in the new boiler-house was ready. The testing engineer, whose logical soul always revolted at such upside-down tactics as testing the boilers *after* the machine, accordingly assembled his faithful thermometers and more or less devoted staff.

On this occasion he removed his coat and collar. His assistant donned a dust-coat with pockets for two slide rules. Some of the old hands on the testing staff almost reached a state of nature before encasing themselves in dungarees, finished-off by rag neckties. Two students, under the wing of the testing engineer, were in a state of bewilderment and subdued excitement. The news that the Test Dept. was preparing to do some work spread like wildfire through the power station.

Before the test proper started, an hour's preliminary run was ordered, and during this the observers were settled down at their posts. Outside the boiler-house the coal was taken from a truck and then wetted; the wetting was to aid combustion and make even fires. The coal was then heaped near the boiler, and sackfuls were weighed and emptied into the hoppers which fed the fires. One man was told off to check the weighing, with a student to assist.

Several six-foot ironclad thermo-couples were pushed through the boiler wall at various places, and lead from these ran down to a table behind the boiler here a superior-looking tester took periodic reading on a milli-voltmeter, made mysterious corrections and translated the results into deg. F. The remaining observer below was the second student, who was gratified by being given the job of reading the manometers on the induced-draught and the uptake to flue

The boiler was isolated and was now fed from the hotwell of a turbine. Before the condensed steam from the latter was allowed to replenish the hotwell, it was measured; in this way periodical evaporation readings were given and the lb. of steam produced by the boiler accurately known. From the hotwell the condensate passed to the boiler. We can follow it aloft and see the remaining observers at work. Here, where the weather does not seem so cool, the height of the water in the boiler drum is taken; there are thermometer readings on the inlet and outlet of the economiser (where the water is heated up by the flue gases before entering the boiler), and on the superheater outlet while a special gauge gives the steam pressure.

During the preliminary run other characters appeared on the scene. The chemist, a department in himself, crystallised out behind the boiler and rigged up an Orsat apparatus. With this he analysed samples of flue gas drawn from a sampling pipe inserted in the boiler wall. Then appeared the contractor's representative, this worthy having breakfasted after some early hours spent in the boiler-house; his bowler hat was di

* "The Acceptance Test," Nov. 28th, 1924.

carded in favour of a greasy little peaked cap—memento of his marine days. He at once addressed himself to a close examination of the boiler fires, peering with a coloured glass through all available spyholes.

A sudden bellow announced to all in general (and the firemen in particular) that the boiler-house superintendent had entered. This official was familiarly known as "Old B. H." Some said that the letters "B. H." referred not to "boiler-house," but "bull-head," while others believed that the initials stood for one of his favourite exclamations. "Old B.H." led a dual life. Outside the boiler-house he was prepared, in the coolest and most scientific manner in the world, to debate upon things like net calorific values; but as soon as he came into the region of boilers his nature seemed to change. He underwent a metamorphosis. When he was "steaming" he became a holy terror and could out-glare the fiercest fire. And now, as he stood on the heap of coal and slated a fireman, one of the testers remarked upon his "nice, kind face."

After the preliminary run, the testing engineer, "Old B.H.," the contractor's representative, and the shift engineer held a round-table conference behind the boiler. During the conference the testing staff retired to the laboratory, which, to the chemist's great indignation, was at once christened "the chemist's shop." Here the older hands gloomily regarded the prospect of the six-hours' test run. The tester in charge of the thermo-couples was looked upon with envy, and that gentleman went to some pains to impress all present with the onerous nature of his duties. One of the students, inquiring as to how the boiler fires were lighted, received various answers ranging from "a match" to "they never go out."

The chemist was now summoned to the conference and, with an uneasy glance at his burettes and beakers, he departed. At the conference a hot discussion anent the fires was in progress. The chemist's CO_2 figures made the contractor's representative flinch; he had already been staggered by intractable coal and poor steam conditions. "Old B.H.," being in the exasperating vicinity of boilers, found the utmost difficulty in remaining polite and technical. The conference was witnessed by the power-station cat, which, by some mysterious faculty, had mounted to the main steampipe. Deciding to take a short-circuit to earth, she leapt down *viâ* a grating and "Old B.H.'s" head. This brought the conference to a close.

Half-an-hour afterwards the contractor's representative announced that he had now persuaded the "biler" to pull itself together. The thermo-couples showed that the mean flue-gas temperature was up, and the steam pressure and temperature near specification values. Alf, one of the firemen, was specially co-opted to keep even fires on the chain grates. The testing staff, just commencing tentative attacks upon their lunch, reluctantly left the chemist's shop. When the coal in the hoppers was levelled-off to the test mark, the word "go" went forth; the first weighed sacksful of coal were shot into the hoppers, and the feed-water and other measurements began.

During the first hour or so of the test everybody was intent upon his job—the student on the draught gauges, for instance, developing such meticulous skill as to read-off the draughts with unheard-of accuracy. One or two little accidents marred the commencement. The thermometer at the economiser inlet was sat on. An observer, unaccustomed to ladders and gratings, fell several feet, but fortunately dropped upon a fellow-observer. Another tyro seized an innocent-looking pipe which actually was nearly red-hot. But all these were just part of the settling-down process.

To the inward joy of the contractor's representative, conditions gradually improved. The chemist reported that the CO_2 figure was round about 14 per cent., and there were only faint traces of CO: this meant that the fires were good—and they would yet be better! Moreover, live-steam temperature was above the specification figure of 680 deg. F. Across the mind of the contractor's representative there floated the magic and entrancing figure of 85 per cent.—the efficiency of which the boiler was said to be capable!

Alf the fireman, armed with his 10-ft. poker, industriously attended the fires. While the boiler-house super. was absent, Alf relaxed somewhat and evinced great curiosity about the scientific apparatus. His imagination had recently been stimulated by the appearance of some Lea coal meters, and he was still somewhat incredulous over the fact that you could weigh coal without the aid of weights. You can judge of his petrifaction when he now found that the long rods thrust into the boiler were *electrical* thermometers! And when the testing engineer peered into the fire through an optical pyrometer, Alf learned that you could *see the temperature*! As he dazedly raked away, the marvels of science made him slacken—till a formidable bellow and a rise of temperature announced the vengeful arrival of "Old B.H." Pulling himself together, Alf, with great presence of mind, removed the red-hot poker from the fire.

Presently an interesting announcement was made: the contractor's representative had arranged for a catering firm to provide refreshments "on the job" and outside in an Army hut. Proof was soon forthcoming in the appearance of a waiter (a waiter!!) bearing a tray, but a boiler blowing-off caused a sudden retreat. However, the refreshments were duly brought back and the response was gratifying. One fellow began to read his thermometer to two places of decimals, and the general opinion of the boiler began to rise. The good news anent the hut spread elsewhere. People with no connection whatever with the test "dropped in," and were entertained by the waiter-in-charge. The shift engineer put on his "going-home" collar and coat, and, closely followed by the power-station cat, left his office. Presently he returned looking extremely pleased with the world. That cat did not accompany him.

The news was heard by Alf, who seized a suitable opportunity and vanished. The waiter-in-charge had by now had all his standards of social status completely upset, and greeted Alf as though he were the owner of the power-station, while the cat directed a fixed stare at the intruder. Alf, with a firm grip on his sweat-rag, hesitated but a moment, and ordered beer and sausages. Meanwhile, "Old B.H." had left the boiler-house and critically examined the appearance of the smoke. Hardly had Alf been served when he felt a mighty roar shake the hut and saw a well-known face glaring through the window. Seizing his refreshments, he dashed out in the nick of time.

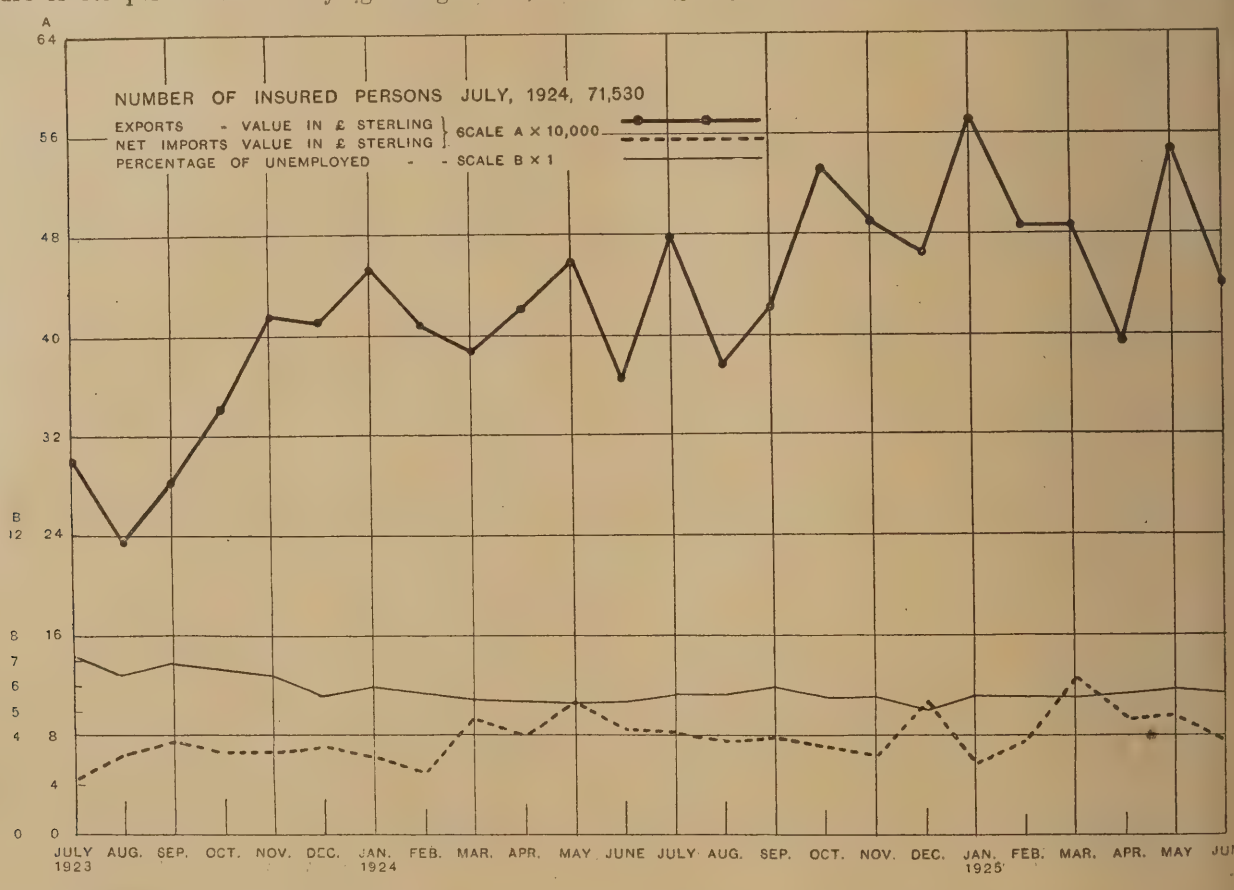
Soon, to the general relief (and particularly that of Alf and the observers up aloft), the end of the long test-run drew nigh. By now the steam had reached 710 deg. F., and the testing engineer had removed his waistcoat. The contractor's representative was in a state of benevolent satisfaction. The fellow i/c of the coal weighing and his worn-out student-assistant now bore striking resemblance to coal-heavers. The chemist filled his last sample-tins of coal and clinker, and took a final check on the flue gases. "Old B.H." made one more request for a furnace temperature, and fumed and blew-off while millivolts were corrected and then converted into understandable degrees Fahrenheit. The power-station buzzer sounded 5 o'clock, and soon afterwards, when the hoppers had reached the mark, the test-run drew to a much-appreciated close.

Many days have passed since then. The testing engineer and his lieutenant have wrestled with their B.th.u.'s and degrees and lb. of steam. The contractor's representative has called several times; this seems to have helped matters, for on his last visit the efficiency figure had passed the 80 per cent. mark. The coal analysis shows that the B.th.u.'s were not as prolific as they should have been, while there was rather too much unburnt carbon in the ash. Grave arguments about the higher calorific value have been heard. Meanwhile, the "biler" and its mates are hard at work, and "will take some shifting." The testing staff remain strongly in favour of the boiler, and continually refer to the unexpected appearance of the canteen and waiters.

External Trade and Unemployment in the British Electrical Machinery Trade.

By W. P. DIGBY.

The student who seeks to appraise our tangled industrial conditions will find that, as regards the electrical machinery industry, a fairly exact co-ordination is possible between the amount of unemployment and the external trade. In the Ministry of Labour returns we have "Electrical Engineering" with 71,530 insured persons in July, 1924, "Electric cable, wire, and electric lamp manufacture," 74,940 persons, and "Electric wiring and contracting," 12,850 persons. It is with the first-named only that the writer is concerned in this article, which contrasts the unemployment figures with the exports and imports of railway and tramway motors and other generators and motors.



The monthly changes in the unemployment rate are set out in the accompanying figure. There have been no serious fluctuations—from July to December, 1923, there was a fall of 1.6 per cent.—thereafter the variations have been within one half of 1 per cent. of a mean figure of 5.5 per cent. Gratifying though it is, it is not the full measure of the healthiness of this industry. In July, 1923, the number of insured persons was 62,280; in July, 1924, there had been an increase of 11.5 per cent. to 71,530 persons.

The total imports in 1923 amounted to £906,111—in 1924 these had been increased by about £55,000 to £959,304 (*i.e.*, about 6 per cent.). Meanwhile the exports, which were £3,951,905, had increased to £5,262,581, or about 33 per cent. on a trade 4.3 times greater than the imports. The monthly variations both as regards total imports and total exports are shown in the accompanying diagram. Expressed per person insured, we have the following figures:—

Period.	Total imports per insured person. £	Total exports per insured person. £
1923 (whole year) ...	14.5	63.7
1924 (whole year) ...	13.4	73.6
1925 (1st half only)	7.13	42.4

The only regret that these figures can occasion is that other industries in Great Britain are not as well placed in finding employment for an increasing number of persons and in increasing the exports per person employed.

It is almost axiomatic that there are no industries so self-contained that their prosperity or adversity is without reaction on other industries. This is well exemplified in the electrical machinery trade; in addition to the primary employment within the industry itself, unemployment is reduced in other industries contributing the component materials such as pig iron or castings, steel forgings and castings, copper wire, core plates, and insulation. Further, an order for a generator for a steam-driven power station involves a prime mover, boilers, steam pipes, coal-handling plant, and very often structural steel for power-station buildings—electric cables and transmission line materials are necessary adjuncts, and even beyond these, lamps and electric motors. If the station is smaller and oil driven there are internal-combustion engines and storage tanks with similar external adjuncts. If it is a hydro-electric power station, there is the need for water turbines of one type or another and pipe line material. As regards the water turbines, firms in the United Kingdom have built and are building machines many times larger than was attempted before the war.

Much of the healthiness of the electrical machinery industry is due to the Trade Facilities Acts. It is possible that no other single industry has benefited so largely in a direct manner. Indirectly the reaction is a widely-spread one. Without the benefits of the Trade Facilities Acts, not only would there have been a different state of affairs to chronicle in the electrical machinery trade, but matters would have been slightly worsened in other trades. It is to be hoped that the Treasury will bear this in mind as and when further applications are made involving electrical plant.

The Manchester Mining Exhibition.

A Brief Review of the Electrical Apparatus Displayed.

(*Concluded from page 168.*)

Messrs. Switchgear & Cowans, Ltd., exhibited a fine range of ironclad oil-immersed switchgear. In the draw-out type section a three-panel board for pressures up to 3,300 volts and line currents up to 60 amp. was shown. All actuating coils, trip mechanism, and meter transformers are within the oil tank, and a supplementary gland is provided, by means of which a bitumen cable can be sealed below the point where the cores are splayed out to fill up any cracks in the bitumen insulation. Examples were displayed showing non-drawout switchgear (fig. 5) for wall and floor mounting, and of 3-phase oil-immersed gate switches (fig. 6), with time-limit overload and the Williams-Rowley protective system for ensuring adequate earth continuity up to the coal cutter. The gate switch will trip and cut all pressure off the motor and training cable in the event of the earthing becoming inefficient, the trailing cable becoming damaged, or any attempt being made to withdraw the pommels from either coal-cutter or gate switch. The plugs and sockets are massive, with self-aligning plug contacts, and designed to prevent the trailing cable being pulled out of the pommel or the pommel out of the socket. Ironclad air-break switchgear is shown in fig. 7; all "live" parts are carried on mild-steel bars covered with insulation on the "metal-mica" principle. The units comprise switches, fuses, and bus-bar chambers, and can be assembled to form boards of any number of ways. The fuse handles (fig. 8) are composed of a heat-resisting, non-hygroscopic, moulded material of greater mechanical strength than porcelain, and the fuse contacts, which are self-aligning, are very readily removed for replacement. The fuse wire is carried in a removable baffle chamber, where the arc is split up and discharges through vents so disposed as to cool and damp the flame. Two sizes of induction-regulating or boosting transformers were exhibited, of 10 and 25 kVA capacity, in addition to colliery transformers for tapping a single-phase lighting circuit off power mains. The latter are flameproof, oil-immersed, and controlled on the primary side by a d.p. oil switch with oil fuses. The fuseholders are withdrawable by raising a hinged lid interlocked with the switch movement so that no live parts can be touched.

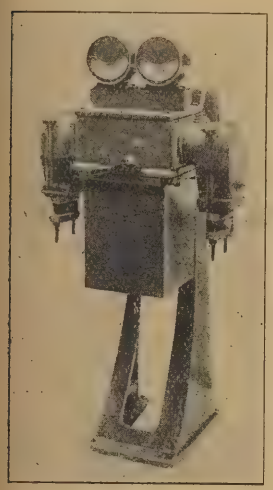


Fig. 5.—S. & C. Non-drawout Switch.

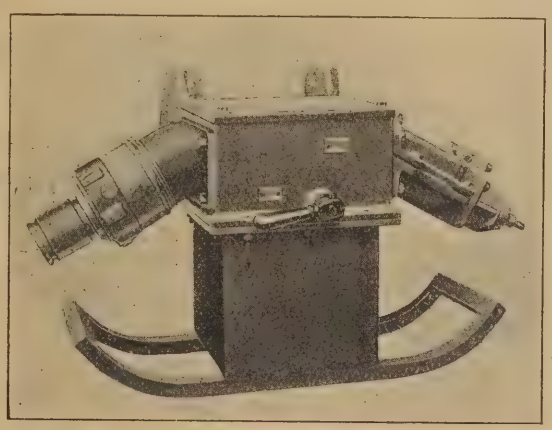

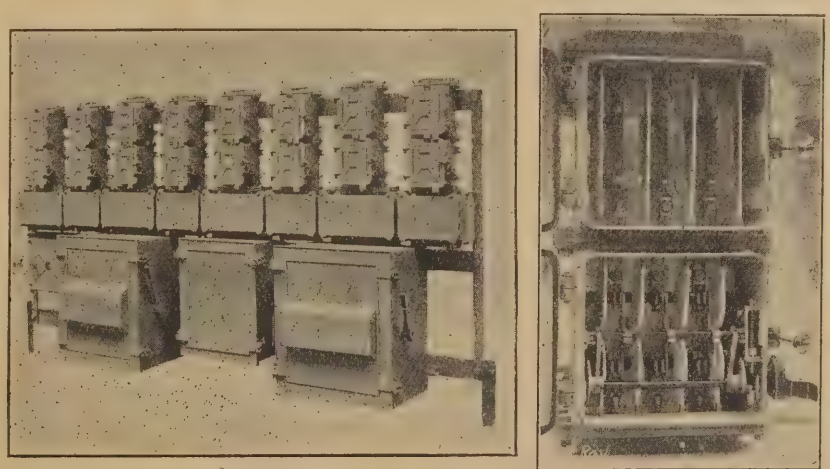

Fig. 6.—S. & C. Gate End Switch.

Alkaline Miners' Lamps, Ltd., exhibited electric safety lamps with alkaline batteries, and it is interesting to record that the Pearson-Nife lamp manufactured by this firm has been selected by the Government of New Zealand for use in the State mines.

The Ceag Miners' Supply Co. had on view the latest form of the lamp which won the Home Office competition in 1912. One of its features is the safety fuse device which, in the event of the well-glass breaking, at once disconnects all exposed "live" parts from the accumulator. The new 4-volt lamp (fig. 9) was also shown; the two "Ceag" circular accumulators are carried in a cast aluminium case, and all connections are made by contacts in the lamp top, which is an aluminium casting hinged from the case. The contacts are of the unit insulator type, so arranged that they can be quickly moved and the interior fittings removed in the usual manner by the bayonet-type ratchet retaining ring. The c.p. of the lamp is 12 in the forward direction and 4 c.p. all round when the reflector is not used. Various units of lamp-room equipment, such as charging stands, running tables, combined switch and magnets, &c., were on view.

Messrs. Mavor & Coulson, Ltd., showed a variety of coal-cutters; amongst them mention might be made of the "Universal" chain machine, "G" size, with 4-ft. jib, driven by a 3-phase motor, and the "Samson" disk cutter arranged to undercut 3 ft. 6 in. There were also a patent electric putter and conveyors and mining switchgear.

Messrs. Oldham & Son, Ltd., showed a variety of safety lamps, batteries, and stone-dusting appliance, together with other mining specialities. The exhibits were housed on two stands, a feature of one stand being the model lamp-room, containing a complete range of lamps and equipment as in every-day use, with a system of checking and accounting both for lamp-room and office records. On the other stand was shown in detail the evolution of the Oldham lamp from its commencement about 15 years ago to present-day types, including the newest 2-volt hand lamps. An interest-

Figs. 7 and 8.—S. & C. Air-break Switch and Fuse Gear.

ing exhibit was a working model of a boy operating a machine for removing and replacing accumulator lids. Although it has not been on the market more than about 18 months, Messrs. Oldham have sold over 100,000, and of this number over 30,000 have been supplied during the last six months. Another interesting item on the stand was a bulb-testing device, an arrangement which tests miners' electric lamp bulbs for shock, candle power, amperage, &c.

Messrs. Hugh Wood & Co., Ltd., exhibited the "Jeffrey" 24-A combination longwall-arcwall electric

Fig. 9.—"Ceag" 4-volt Miner's Lamp.

coal cutter, by means of which 20 headings, each 15 ft. wide and 6 ft. under, can be cut in a shift and over 1,000 yards fitted.

Messrs. Anderson, Boyes & Co., Ltd., showed an interesting range of coal cutters, chief amongst which were arcwall and longwall disk machines. Some of their mining switchgear was also shown.

Messrs. Beckett & Anderson, Ltd., had a large display of haulers. An interesting one was the new 5-h.p. main rope hauler, with internal gear in an oil bath; the drum carries 200 yards of $\frac{3}{8}$-in. rope, and the operation is similar to that of the well-known "Becander" 10- and 30-h.p. standard gear drum haulers. Fine adjustment and variation of speed can be attained with this machine, and as well as working into colliery dips it can be used for various purposes in other trades.

The Harland Engineering Co., Ltd., showed one 350-h.p. horizontal pumping set; the motor is 3-phase, 50-cycle, 3,000 volts, 1,500 r.p.m. There was also shown an E.F.V. $6\frac{1}{2}$-30 h.p. motor, 3-phase, 50 cycles, 440 volts, 1,000 r.p.m., and part of this stand was occupied by the Rheostatic Co., Ltd., which displayed

Fig. 10.—"Oldham" Miner's Lamp Lid-removing Device.

to good effect "Service" resistances, including air-cooled colliery resistance with a metal-mica terminal bar and boiler plate terminal chamber. There was also an oil-immersed resistance with an accessible terminal bar and corrugated explosion-proof tank.

The Lancashire Dynamo & Motor Co., Ltd., had a 45-kW motor-driven alternator set in operation, supplying power to many of the exhibitors. One 30-b.h.p. and one 50-b.h.p. flameproof slip-ring inductor motors, with explosion-proof covers over the brushgear, were shown as tested and certified under fiery mine regulations. There was also a 20-b.h.p. "Maxtorq" motor and a separate display showing the construction of its rotor; battery charging sets and other standard products completed this exhibit.

House Wiring at So Much per Set!

A Revolutionary Suggestion at the I.M.E.A. Convention.

By E. G. ROSS, A.M.I.E.E.

Mr. L. L. Robinson, of Hackney, struck a new note in the somewhat remarkable paper he read before the I.M.E.A. recently. He said, in effect, that he would like to see the time arrive when any man would be able, at will, to buy his own wiring installation, all ready to put together, just like a set of wireless components packed up in a box. To a certain section of the electrical trade this must have sounded like rank heresy; yet, from the report of the discussion, few, if any, of the subsequent speakers appeared to realise the significance of Mr. Robinson's words. Was this wilfully so, or inadvertently so? It is worth while to devote a few moments' consideration to the matter, as it is really suggestive of something revolutionary in electrical commercial practice.

Primarily, all must agree that, to the average man in the street, the *installation* of electricity in his home is a serious matter. Just now, to put in a decent installation costs him from £20 to £30, and this does not cover anything of an elaborate nature; rather the reverse, in fact. The rapid growth of municipal hire-purchase schemes is tangible proof of the desire to use electricity, but, simultaneously, is a very plain demonstration that the average man simply cannot, or will not, pay for the installation part of the business as a preliminary to the use of the power. The fact that he is willing to "pay as he goes" is a clear indication that he does not see why the means to use electric power should be also the means of depleting his pocket, in addition to the cost of the energy itself. He realises

very well, as the increasing sales of irons, table lamps, luxury fittings, &c., demonstrate, that he must pay *something* for the apparatus necessary to use power, but why a man's long time, plus a heavy shop oncost, plus an outside profit, should be charged to him is beyond his comprehension.

It must not be forgotten that, to the layman, the term "supplier of electricity" covers everything in connection with electricity, and the position of the contractor is more or less vaguely defined in his mind. Thus, when he applies for a supply of energy, he has the feeling that it should be put in free, or, at least, at a nominal charge. The fairness of this is, of course, debatable, but is not of moment here. Many years of gas companies' activities have brought about this state of affairs, since, when the present average house was built, gas was installed as a matter of routine construction. Any expense due to the gas installation has either been very small as money values go to-day, or has been so camouflaged that the consumer did not, and does not, realise a direct charge upon his means. Thus, for example, his rent, say, covers the first cost in certain instalments, and so on. With the newer houses, of course, electricity is now having a similar look-in, but the experience of years of gas will take much eradication. And here again, the first cost of the electrical installation is no mean item in the fixing of the rent. In certain large municipal housing schemes north of the Tweed the following rents obtain:—

Coal-fired house with electric light and gas boiler	£37
Same house, but "all electric" ...	£42

This is despite the fact that the all-electric scheme does away with the building-in of fireplaces and awkward vents! It certainly does seem absurd that the comforts of electricity should mean an increase of about 13½ per cent. in rent. The difference, perhaps less a small amount, is made up by installation charges and expensive utensils, *e.g.*, cookers, fires, kettles, &c.

Then, again, there exists a rooted dislike to "men coming in to make a mess." For this reason it is quite the thing in these days for a man himself to do odd jobs about his home, if time permits. If he is handy at all, the modern householder paints, papers, mends leaky taps, &c., himself, rather than have anyone enter his private precincts. Cost, of course, probably enters here too, but the point to be noted is that, to the householder, all such work is "jobbing" work, and as such "is better done by myself." Hence, at present, the wireman is largely regarded as a necessary evil before he commences work at all. If he does make a mess, the sooner he finishes it the better. Much worse is it when, having finished the job, he leaves the householder a budget of extra expense for getting walls patched up and repapered, or the family piano choked with lime dust. While the average electrician hardly goes so far as this, yet it is a fact that many a wireman leaves a memorable trail behind him. All this affects profoundly the most vital person of all—the housewife. If she, who really does the using of the power, is prejudiced at the beginning, how much less easily will she be guided to a proper appreciation of all that electricity really means! But even she, if father can hang a picture without smashing his thumb, will be satisfied if father can likewise install "the electric light" without causing her undue inconvenience. Despite much talk, it is thought that many electrical people do not yet realise that the person expressing the keenest desire "to do it by electricity" is the housewife—and she really does believe in the average husband's capabilities, however much he may be dubbed "dud," "curb-stoner," or any similar term.

From the trade point of view, the householder is unskilled, and, as such, ought not to be trusted to do wiring work. This idea, however, has largely become ingrained in trade minds through the activites of the "dud" contractor, whose slapdash work is the result of desperate price cutting coupled with sheer stupidity. But if the householder can procure good and suitable *material* at a fair figure, the question of price cutting does not arise in his case, and he is not, on the whole, a stupid person. The average man can be just as smart with his hands as can the wireman. Until now he has not been shown the "how" of wiring, due to natural economic and commercial circumstances. For example, he never enjoyed the hand and eye training in his younger days that his son does nowadays, nor, until the advent of the comparatively cheaply-obtained motor-car, did he have the opportunity of turning his thoughts in a mechanical direction. Further, the lack of public electrical education has made him, until now, hesitate to take on the job of wiring his own house.

All this is changing, however. The public is now waking up to the fact that electrical wiring is not such a big job as at first it appeared to be. Slowly, but with ever-increasing momentum, the public mind is broadening to electricalities of all kinds, perhaps most noticeably in the matter of wireless. After nearly three years of broadcasting, quite a large section of the populace understands clearly the principles governing the lighting of a valve, irrespective of its other functions. Another large section is fully conversant with motor-car lighting, &c. From this it is but a simple step to the house lamp.

Again, various technical schools have instituted "trade classes," which are largely attended by other than general technical students. Indeed, the student who is wiring every hour of the day rarely attends a wiring class; he goes to something more advanced. The trade class is known to be a favourite resort of handymen, old and young.

Thus, the fear of an electric shock is only a temporary phase in domestic wiring development, and even now an observant eye will notice, especially among, and inside, out-of-the-way ironmongers' and painters' shops, modest notices advising clients that estimates can be given for any size of electrical installation, or instructing them to "Electrify and paint together: it saves mess," and so on. This is particularly noticeable in the establishment of the "general domestic engineer," a comparatively new profession, which appears to have originated in furniture emporiums and the like. Possibly many of these people depend upon a genuine electrical contractor; possibly not; but the fact remains that they, at least, are beginning to regard house wiring merely as a side-line to tempt the householder.

Perhaps the most eager electrical tyro is the average schoolboy. Wireless mad, say, he can teach many of his superiors the rudiments and practical details of electrical continuity, insulation, &c., &c. What must be the result? In the course of a few years the ordinary house circuit will simply be regarded as a matter of course, instead of a shock bogey. The other rule comes in too, *viz.*, the rate of growth of a body is proportinal, . . . &c.

It seems inevitable, therefore, that domestic wiring will actually descend (?) to the level of mere jobbing, which will further accentuate the point previously raised anent the cost of installation. It seems, indeed, that the latter will decline through force of economic circumstances alone, *i.e.*, without any attempt to make it do so as a matter of normal trade competition.

To meet this future condition, then, it would appear that it is now time to set about, in earnest, the simplification which must come. This does not mean, of course, that there has not been a movement towards simplification already. There has: new surface-wiring systems are advertised every now and then with notable regularity, each new system claiming to simplify this, or eliminate that; but these systems have not been evolved to meet the consumer's point of view. They have been evolved through force of trading circumstances. Has anyone yet seen an advertisement stating the advantages of the "X wiring system" to the consumer? To the contractor, yes; but to the consumer, no.

This order must change, for, as the consumer becomes more educated electrically, he will become quick to appreciate the said advertised advantages at their face

value and naturally will turn them to his own use in so far as he is mechanically able to do so; which ability, since surface-wiring systems require few tools other than a hammer, screw-driver, drills, and pliers, will approach within reasonable distance of the skill now used by the average wiring electrician, who will perhaps only be superior in the fitting-up of the heavier tube and industrial installations, which, of course, will not concern the householder at all.

From this it will be seen that two main conditions will arise, *viz.*, (*a*) There will be an insistent demand for a very simple "boxed-up" wiring outfit, which, if *not* supplied, must lead (assuming present legislation to continue) to (*b*) home wiring on a large scale by the semi-skilled (?) using material not suited for use by them. We unfortunately know already what the real (*b*) means! At present we have many instances of deliberately scamped work, but in future the scamping (if any) will be much less deliberate than unconscious, which is perhaps worse. It will then be clearly in the interests of the community, as distinct from those of the trade, for the trade to produce and supply to the semi-skilled, the "boxed-up wiring set," ready suited to their needs.

How such a "set" will be put up will, of course, depend upon many factors, not the least of which will be the amount of standardisation admissible from various points of view, the factor of safety allowable by rules, &c., the best method of fixing cables and fittings, and so on. Possibly such systems in general will embody:—

(*c*) Non-metal-sheathed cables (to remove the vexed question of earthing), made with fixing lugs integral with the insulation and holed to take a screw.

(*d*) Light fittings ready wired complete, with suitable externally fixed ceiling roses, &c.

(*e*) Moulded non-metallic distribution boxes externally fixed and arranged one per floor or per standard section of wiring, and therefore

(*f*) standard fuses,

(*g*) switches, plugs, joint boxes, &c., all moulded to abolish the present wooden blocks, &c., and to allow of external fixing, and also so arranged inside that all cable holes and terminals are easily accessible from the top,

(*h*) main switch and fuses supplied and fitted by the supplier of energy,

and so on—to detail everything would require a separate article. The point is that, as an ordinary manufacturing proposition, the scheme is feasible enough. The difficulties will arise outside the factory, perhaps notably in the various policies of supply authorities, contractors, insurance companies, and the like. But that at the moment is by the way. As a commercial matter, the revolutionary (and evolutionary) character of the "wiring outfit" will cause quite sufficient disturbance to bring all points of view to the fore. The industry is healthy enough to stand up to either praise or gnashing of teeth with regard to any of its activities, and if the present remarks tend to focus attention upon a potential development of wiring, then so much the better.

The Daventry Broadcasting Station.

Official Inauguration of High-Power Plant by the Postmaster-General.

Although somewhat inaccessible geographically, the new high-power station of the British Broadcasting Co., Ltd., will well repay the time expended by those privileged to visit it. It is the latest of the 20 B.B.C. stations (9 main, 10 relay, and one high-power) and will take over the functions of the Chelmsford experimental plant, retaining, however, the familiar call signal, 5XX, and wave length of 1,600 metres.

The programmes will continue to be relayed from the London studios by means of a Post Office land line, but a small studio has been provided in the station buildings for use as occasion arises. The inaugural ceremony was performed on July 27th by Sir W. Mitchell-Thomson, H.M. Postmaster-General.

Situated on Borough Hill, Daventry, in Northamptonshire, at an average height above sea level of 650 ft., the two masts are each 500 ft. high, giving a total effective height of 1,150 ft. Each is a triangular lattice structure stayed at each angle by seven guy ropes, twenty-one ropes in all, both the foundation of the masts and the anchorage of the ropes being concrete blocks. The distance between the masts is 800 ft., of which 600 ft. is occupied by the aerial and two 100-ft. lengths by the supporting cable. The aerial is of the T-headed variety, and consists of 10 wires supported in hoops 5 ft. 6 in. in diameter.

The down-lead is a six-wire cage, and enters through the roof of the station. The ends of the aerial insulators, which are of porcelain and approximately 5 in. long, terminate on the live side in anti-corona rings. Winches are provided at each mast in order to lower the aerial for periodic inspection without necessarily having to climb the masts, which feat is reported to occupy 20 minutes to accomplish. The location of the aerial is approximately N.E.-S.W. On the platform of each mast is provided a bowl-shaped warning light for aircraft. Each bowl contains four lamps, two of which are in use alternately and two as a standby.

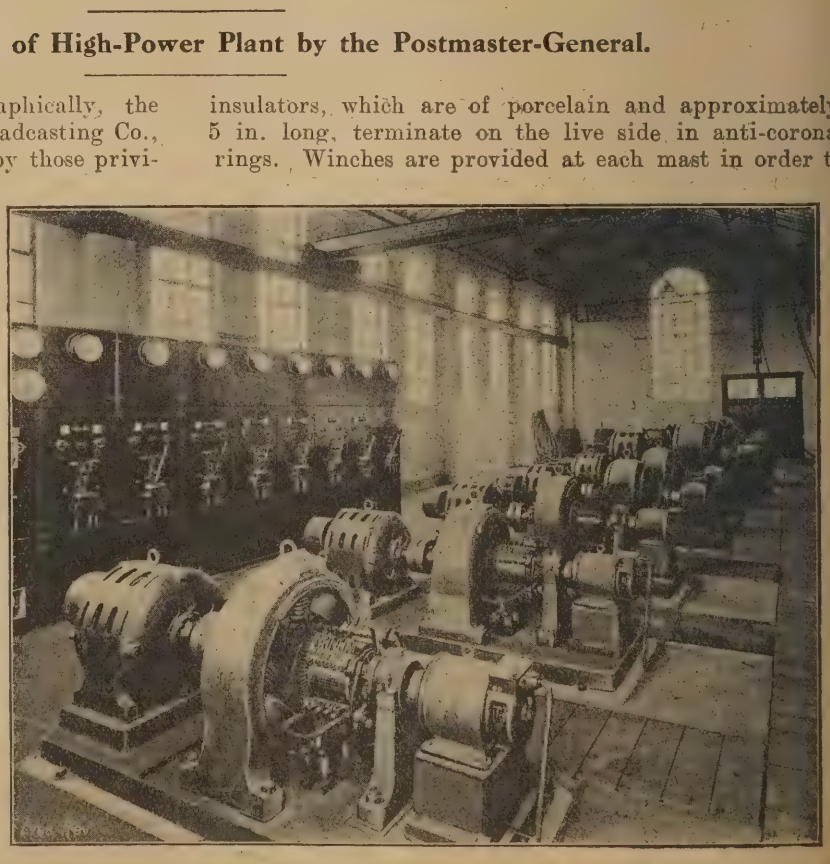

Fig. 1.—Machine Room and Power Switchboard.

The lamps are in series with two small bulbs within the station, and also a mechanical make and break device to switch the lamps off and on alternately. Should a lamp burn out, the small blubs will give occular warning.

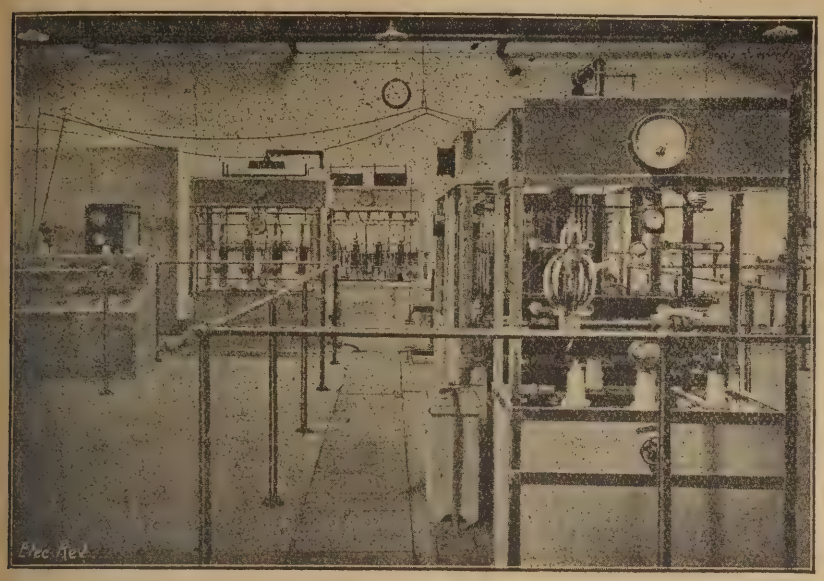

Fig. 2.—Transmitting Apparatus; Sub-modulator Panel in Foreground.

The earth system appears to be very complete, consisting in the first place of three copper sheets buried beneath the station itself, to which all machinery and frame work is earthed, and, secondly, of 36 zinc plates disposed round the station in a 100-ft. circle. Insulated wires from these earthed plates are each led on short masts over the roof of the building to the centre near the aerial down-lead, both the aerial and the connection of the 36 "earths" entering the roof near one another and proceeding directly to the tuning inductance beneath. Such an earthing system forms an electrostatic screen over the roof, and probably reduces aerial losses to some extent.

The power to operate the station is derived by duplicate cables from the Northampton Electric Light and Power Co. at 11,000 volts, the supply being 3-phase a.c., which is transformed down to 375 volts in a small sub-station. It was considered unsound to rectify the 3-phase power directly for supplying the valve transmitter, as a slight unbalance on any incoming phase might cause difficulty in maintaining the requisite degree of "smoothing," so rotary machines have been provided to furnish a single-phase supply. Besides pumps, &c., the power plant consists of three (one spare) 70-kW, 1,000-V, 300-cycle motor-alternators for supplying power to the modulator and magnifier valves; two 25-kW, 1,000-V, 300-cycle machines (one spare) for supplying power to the drive oscillator and for heating the filaments of all the rectifying valves; and three 10-kW motor-generators (one spare) delivering d.c. at from 20 to 30 volts for heating the filaments of the drive, sub-modulator, modulator, and magnifier valves. All these machines are fitted with individual self-exciters (fig. 1).

The independent drive unit comprises two air-cooled rectifying valves and one water-cooled oscillator, the former being arranged for full-wave rectification, and supply d.c. at 10,000 volts through the usual smoothing circuit to the oscillator anode. The drive oscillatory circuit is constructed of a pair of copper strip inductances astatically connected to reduce the external field, and an air dielectric condenser shielded by a metal case. The plate input to the drive oscillator is about 8 kW which is an unusually high ratio of the power supplied to the magnifier, but this permits of the magnifier grid excitation being secured with a very loose coupling, resulting in negligible reaction back on the drive and consequent freedom from frequency variation with variation of magnifier input.

The magnifier is formed of four water-cooled rectifier and three water-cooled oscillatory valves; the latter are capable of dealing with an input of 30 kW at 10,000 volts, and will be normally operated at 10,000 volts with a plate current of 2.5 amperes. The filament input is the same for all the water-cooled valves used, namely, 1 kW each at 20 volts and 50 amperes. The oscillatory circuit of the magnifier consists of an inductance of stranded cable and a shielded air condenser. The grids of the magnifier are excited inductively from the drive circuit, the direct grid-current required being about 300 milliamperes for the three valves. The grid circuit includes an anti-reaction coil inductively coupled to the plate inductance in such a manner that the internal valve capacity coupling is neutralised, so that it is not possible for the valves to operate as a self-oscillator if the drive excitation is removed. This adjustment is an important factor in securing stability of working and constancy of wavelength. The closed oscillatory circuit of the magnifier is inductively coupled to the aerial-tuning inductance, which is made of the same stranded cable as the closed-circuit coil.

The modulator portion consists of four water-cooled rectifiers and six water-cooled modulators; the modulating valves are similar in size and appearance to the oscillators, but have a much more open grid mesh with a low amplification factor. The modulator is worked with plate voltage and current equal to that of the magnifier, the current being adjusted by the setting of the grid negative voltage; for normal working this setting is between 1,200 and 1,300 volts, negative, thus a large grid sweep is possible during modulation without running into grid current. The grid negative voltage is obtained from a dry-cell battery, and as no current is taken, this source is quite satisfactory, as has been proved by twelve months' testing at the Chelmsford station.

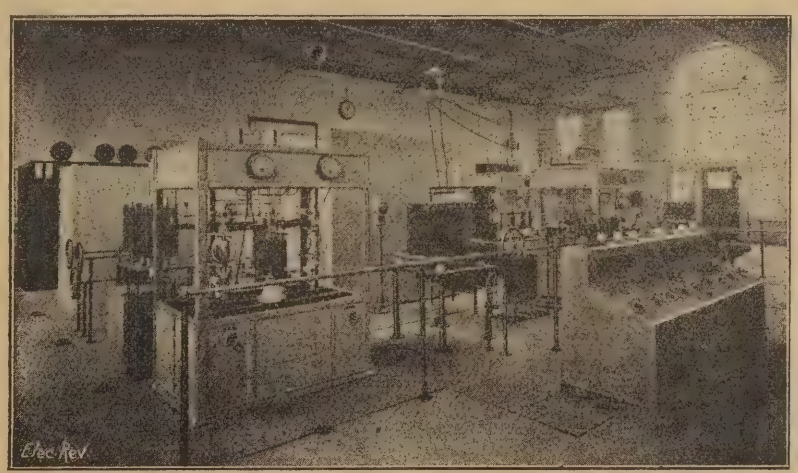

Fig. 3.—Transmitting Gear; Control Desk and Drive Panel in Foreground.

The smoothing circuits for a set of this size present something of a problem, as the permissible ripple is very small for high-quality broadcast telephony, and the smoothing units are necessarily somewhat bulky and costly. The condensers consist of zinc plates with glass dielectric, oil-immersed in porcelain containers; the total capacity used on each half of the circuit is approximately 3.5 microfarads, and the inductance about 16 henrys. The smoothing inductances are closed iron-core chokes in oil tanks, each choke containing about 5 cwt. of iron, and there are eight of them in all.

The one sub-modulator air-cooled valve is operated from the same h.p. source as the main modulator, and is coupled by resistance and capacity to the grids of the modulator valves. The grid of the sub-modulator is, in turn, coupled also by resistance and capacity to the sub-sub-modulator, which is a block of four valves supplied by a 400-volt accumulator battery and with accumulator-heated filaments. The usual land line amplifiers are situated in a separate room (fig. 4), removed as far as possible from the high-frequency apparatus, and are adaptable for amplifying either the audio-frequency currents coming over the land lines, or those from the microphone in the local studio.

Marconi-Osram valves are used, and as the anodes are at high potential, it is necessary to insulate the water jackets from the main supply of water. This is accomplished by running the water both into and out of the jackets through spraying nozzles; the water spray forms an almost perfect insulator, and no loss is sustained by leakage. The cooling water falls by gravity through the jackets, and the rate of flow is adjusted to allow about one gallon per minute through each valve. As it is important to use water free from lime or other ingredients capable of forming a deposit on the anodes, rain water is utilised; it is drained from the roof into

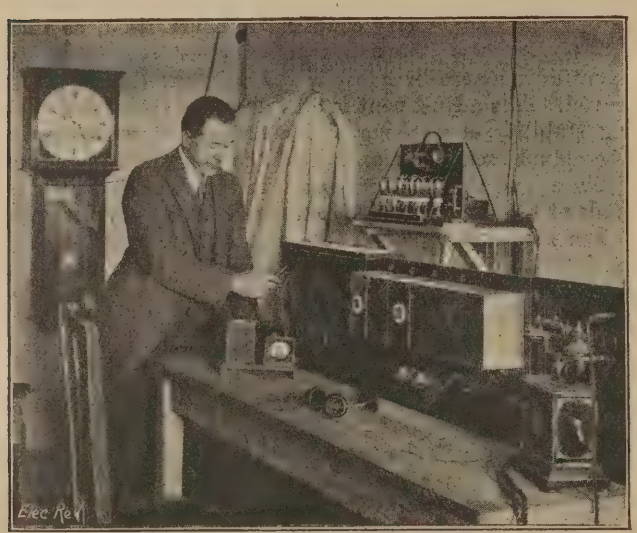

Fig. 4.—Mr. H. W. Litt (Engineer-in-Charge) in Amplifier Room.

a storage pond, a rainfall of one inch adding about 1,000 gallons to the pond.

London still remains the centre of the distribution system, and on reception of the signals at Daventry by land line they are amplified to the requisite strength to operate the sub-control valves, fig. 2, of the transmitter, while provision has been made for increasing the output to 50 kW should the necessity arise and permission to do so be obtained from the P.O. authorities.

A workshop and office accommodation have been provided, and the whole assemblage imparts an impression of light and spaciousness, the connections appearing to have been made with almost diagrammatic neatness. These features, together with reasonable duplication of lines and parts, should not fail to give adequate service when the new station has settled down to routine work. The transmitting apparatus has been designed and made by the Marconi Company on the "unit" system, that is to say, the apparatus for each separate operation is self-contained in polished aluminium framework, access to it being obtained through a safety gate which, when it is opened, makes it impossible to switch on the power. The control of the whole plant, including the operation of the running machinery, is effected by a control table in the transmitting room. Should any defect arise, the engineer on duty can switch off the entire plant merely by pushing one button. Prolonged experiments have been made on the land line in order to secure the best quality of transmission, and the B.B.C. has received the fullest co-operation of the Post Office engineers. The Western Electric Co., Ltd., designed the special line amplifiers; the Radio Communication Co., Ltd., was responsible for the masts and aerials, and the Electric Construction Co., Ltd., supplied the electrical machines and switchboards.

The B.B.C. is making no extravagant claims for its new station; the removal of 5 XX farther from London was a Government ruling, the authorities having stipulated that it must be situated north of a line drawn from the Severn to the Wash, and so located that as much as possible of the area served by it would be land; a 100-mile circle round the site encroaches on the sea in three places. To have worked with five different Postmasters-General and equipped 21 stations during the two years and a half the company has been in existence is no small achievement.

Parliamentary News.

[By Our Special Parliamentary Reporter.]

Adjournment.—The Prime Minister stated on August 3rd that it was hoped to adjourn to-morrow (Saturday) until November 16th.

The Mersey Tunnel.—Last week the Select Committee of the House of Lords concluded the hearing of evidence in connection with the Bill promoted by the Liverpool and Birkenhead Corporations empowering them to construct another tunnel under the Mersey between the two towns. The Committee passed the Bill.

Telephone Development.—On July 28th, Sir W. Mitchell Thomson, the Postmaster-General, in moving the second reading of the Telegraph (Money) Bill, said that it was proposed to authorise the State to raise credit for expenditure on the development of the telephone system at the rate during the next three years of, roughly, £1,000,000 a month. In 1925-26 it was proposed to spend £12,000,000; about £12,000,000 the year after; and £11,000,000 in the third year.

The Bill was read a second time.

Electricity in Mines.—On July 28th, during a discussion on safety in mines, a number of members urged the universal adoption of electric lamps in place of the present safety lamps. Electric lamps, it was contended, were far safer and more satisfactory. Further, the use of electric lamps would prevent miners' nystagmus.

Col. Lane-Fox, Secretary to the Mines Department, said that 350,000 of the lamps now used were electrical.

Lead Poisoning.—On July 28th, on the Home Office Vote, Lord H. Cavendish-Bentinck said that lead poisoning was rapidly increasing, and electrical accumulators were responsible for a large amount of it. There were 35 cases in 1921 and 101 cases in 1924.

Sir W. Joynson-Hicks, Home Secretary, agreed that most cases of lead-poisoning occurred in the manufacture of electric accumulators and in the work of ship-breaking. The manufacture of electric accumulators was one of the industries which had been booming. The subject had been under the careful consideration of the Home Office, and he had issued new regulations which, he hoped, would have the effect of removing the dangers in that industry.

Radio Licences.—On July 28th, Sir A. Holbrook asked the Postmaster-General if he would consider the adoption of a definite scale of fees in respect of transmitting licences for wireless telegraphy so that the efforts of British research workers might be encouraged and that the valuable work of experimenters, particularly in the direction of short-wave transmission, might not be hampered.

Sir W. Mitchell-Thomson said that a definite scale of fees for experimental sending licences was already in operation.

Municipalities and Electrical Apparatus.—On July 30th during the debate in the House of Lords on the Burnley Corporation Bill, Lord Banbury moved to leave out Clause 26, which empowers the Corporation to sell electrical fittings. Up to 1902, he said, powers were given to various Corporations to supply and sell electrical fittings, but after that year, there being a strong feeling against municipal trading no further powers were given to sell such fittings. Powers were given to supply electrical fittings on hire, because it was stated by the corporations that they were in a better position to do this than private contractors, and that it would probably encourage the use of electricity if they were allowed to let fittings on hire, but the purchase of fittings had to be made through a contractor. In 1912, the House of Lords adopted the House of Lords Model Clause, whereby any such sales or work required on consumers' premises had to be carried out through an electrical contractor. In 1919, by arrangement with the Electricity Commissioners and supply authorities Section 23 of the Electricity (Supply) Act, 1919, was agreed to. It gave local authorities power to provide and let on hire repair, and maintain electrical fittings, but prohibited them from selling them unless expressly authorised by their special Act or Order. But under the present Bill the Select Committee had practically turned down this clause and had given power to the Burnley Corporation to sell electrical fittings

Last year a Select Committee deleted a similar clause in the Wakefield Corporation Bill. He objected to municipal trading.

Lord STRACHIE, as chairman of the Select Committee, explained that such power was already possessed by some 80 other authorities. The Corporation was not asking for power to manufacture, only to sell, and the Committee was unanimously of opinion that the Corporation had carried out its electricity powers very well indeed. The rates were low, and the work was done efficiently. Arrangements were made for purchase of electrical fittings on the hire-purchase system. Without some system of hire-purchase or deferred payment, small-value houses could not get electrical facilities as quickly as they should. The expansion of electricity meant cheaper light and power, and, in addition, the greater the supply of electricity the greater the demand for fittings, lamps, and so on. This, in its turn, meant that there would be an increase in employment.

Lord DONOUGHMORE, chairman of Committees, supported the clause, but pointed out that there were now in the country three systems under which the municipal authorities supplied electricity. There were some with full power to sell fittings; some with no power to sell fittings; and some with power to sell solely through contractors. All three systems could not be the best, and it was only the best that should be adopted in encouraging the expansion of the electrical industry. He urged the Government to set up an inquiry in the autumn or next year, similar to the 1912 inquiry, when there was a Joint Committee of both houses, to settle the matter once for all.

Lord SALISBURY, Lord Privy Seal, undertook to transmit this suggestion to the proper quarter.

The amendment to omit the clause was negatived, and the Bill was read a third time.

The Rutenberg Concession. — On July 30th, Captain WATERHOUSE asked the Secretary of State for the Colonies what arrangements, if any, had been made by the concessionaire under the Rutenberg concession to erect the Yarkon power house; if any pressure was being brought to bear in order to expedite this work; and if, and when, the penalty clause under Clause 4 of the agreement would come into operation.

Mr. ORMSBY-GORE said that the greater part of the area covered by the Jaffa Electric Company's concession was already supplied from a fuel power station at Tel Aviv. The company had been required to submit a scheme within a period expiring in two months' time to supply the remainder of the area, which comprised the town of Petach Tikvah and the surrounding area, either from the existing fuel station or from a hydro-electric station constructed in accordance with the original plan. The Palestine Government would no doubt consider the propriety of bringing the penalty clause into operation if the scheme was not submitted within the time limit specified above.

Royal Assent.—In the House of Lords, on July 30th, the Royal Assent to the following Bills were notified:—Statutory Gas Companies (Electricity Supply Powers); London County Council (Tramways and Improvements); and the London Electricity Supply (Nos. 1 and 2) Bills.

Correspondence.

Correspondents should forward their communications **at the earliest possible moment.** *No letter can be published unless we have the writer's name and address in our possession.*

A Proposed Institute of Radio Engineers.

I think it has been quite clear in all the correspondence that the above society was proposed because there did not appear to be any body in existence in this country which catered sufficiently for the growing number of wireless engineers.

I am very pleased to say that by invitation of the Committee of the Wireless Section of the Institution of Electrical Engineers, I was present at a meeting of the Committee which took place on Friday, July 25th. Matters were discussed very fully, and I must thank the Committee for the businesslike manner in which it dealt with the subject. For the present it is sufficient for me to state that I am satisfied that entrance into the I.E.E. by those professionally engaged in wireless matters is not as difficult as I had imagined, and that it is realised by the Institution that radio matters are of great and growing importance.

I would like all those who have written supporting the proposed society to feel that they have done a great deal of good in demonstrating the need of more activity in wireless matters. Further criticisms on the position after perusing any statement the Council of the I.E.E. may make in the technical Press can be sent to Mr. Y. W. P. Evans, 66, Oxford Road, Manchester. All our friends may rest assured that their interests will be well looked after.

J. Nelson.

Prescot, *July 27th*, 1925.

[A communication from the secretary of the Institution of Electrical Engineers on this subject will be found in our "Notes" columns to-day.—EDS. ELEC. REV.]

Celluloid in Accumulators.

The letter from Mr. C. Lack in your issue of July 17th may give the impression that A.F.A. cells are the only make which are fitted in glass containers, and I should therefore like to make it clear that there are numbers of British batteries which are also fitted in glass containers, and are equally efficacious in the prevention of fire.

The A.F.A. cells referred to are presumably those which are made in Germany, and in furtherance of the policy that British-made goods should be bought in preference to foreign goods, I think it well to let your readers know that there is no need to buy foreign batteries when British-made batteries of better quality than the usual Continental make can be obtained readily in every town in the United Kingdom.

D. C. McLagan,
Secretary, The Accumulator Makers' Association.

London, S.W.1, *July 28th*, 1925.

The Evolution of Electric Cookers.

The comments and suggestions given in your issue dated July 24th are very interesting. It is to be hoped that the proposals contained in the last paragraph will be adopted.

With respect to heating elements, there is now available a non-metallic element which appears to meet a long-felt want in the domestic and industrial electric heating field.

The enclosed printed matter gives some technical particulars respecting these new elements, which are sold under the trade mark "Globar." The advantages to be obtained by the use of non-metallic elements are sufficiently obvious to be fully appreciated by the *user* of the apparatus, as "Globar" elements can easily and readily be replaced by unskilled labour without the use of resistance wire or refractory supports. In other words, the client can carry out his own repairs at a minimum of expense.

As the makers of "Globar" aptly state, "Globar is to heat what tungsten is to light."

A. Imbery.

Halifax, *July 29th*, 1925.

[We are obliged to our correspondent for drawing attention to this type of heating element. No details of its composition are given in the printed matter referred to, but it is stated that the elements can be used at temperatures up to 2,500 deg. F., or even 3,000 deg. Apparently it is made in the form of rods with metallic terminals, and it is said to be mechanically strong.—EDS. ELEC. REV.]

Is there an Age Limit?

With reference to the letter by "Too Young at Forty" in your issue of July 24th, it is obvious that the writer of that letter did not serve with the forces during the war. He seems to forget the debt which he owes those that protected him, and, in fact, would now make profit out of their patriotism.

A. G. Porter,
Major.

Spalding, *July 29th*, 1925.

Your correspondent "Too Young at Forty," in your issue of July 24th, accurately "Hits the tin-tack on the cranium" without any exaggeration, and I think that perhaps my analogous "tale of woe," told briefly, may interest some of my fellow valetudinarian readers.

My late employers—a London manufacturing electrical company—were compelled to close their works last March, owing to lack of capital, trade depression, &c., and thus after 12 years' service, with excellent testimonials, I became enrolled a "Member of the Micawber Million" (or more).

I had previously been engaged for 15 years with a Lancashire firm of electrical engineers—after a five years' apprenticeship at a well-known electrical works in the North of England—and although I am "two-score-and-ten," I have never experienced one day's illness during my working career.

Since last March I have replied to dozens of advertisements in the electrical Press, &c., but without success to date, notwithstanding that I have offered to accept a mere "existing" emolument, rather than be without means or occupation any longer.

Methinks, therefore, it seems palpably obvious that I am evidently "too fossilised at fifty," with visions of a "Pauper's Palace" distinctly looming ahead.

M.I.E.E.

July 31st, 1925.

French Water Powers.—It is reported from Paris that various schemes are in course of preparation which aim at the systematic utilisation of the water powers that are still lying idle, particularly in the south. It is proposed to render it possible for the farmers all the better to be able to carry on agricultural operations and at the same time more intensively to cultivate the soil. The systematic execution of the schemes, which are said to be connected with the Dawes plan, is expected gradually to render the country to a large extent independent of the imports of coal.

Business Notes.

Commercial and Industrial Developments, Business Changes, Trade Opportunities, New Publicity Literature, Liquidations and Failures.

The N.A.R.M.A.T. Exhibition.—An exhibition of radio apparatus produced by members of the National Association of Radio Manufacturers and Traders is to be held at the Albert Hall from September 12th to 23rd. We have received a prospectus from the publishers of the official catalogue, Messrs. A. J. Wilson & Co., Ltd., 154, Clerkenwell Road, E.C.1, containing particulars of advertising rates, &c.

Employment after Apprenticeship. — In an article upon this subject in the July issue of *Industrial Welfare*, Sir Alexander M. Kennedy analyses the causes of parents' hesitation to apprentice their sons to skilled industries, finding that the principal fear is that employment will not be available when the apprenticeship has been served. The author considers, however, that whatever the temporary difficulties are, the ultimate prospects of remunerative employment for the skilled men of the rising generation are as great as they have ever been, and that the evolution in industrial machinery and methods has made skilled apprenticeship even more indispensable to industrial prosperity. To those who are charged with any responsibility in guiding young persons entering employment to-day, the author says that in his opinion the future status and opportunities of the young skilled craftsman will be such that they need have no hesitation in recommending lads to enter themselves in the skilled crafts.

Mersey Power Co.'s Extensions.—A new extension to cost nearly £250,000 is being carried out at the Mersey Power Co.'s station at Runcorn. The following orders have been placed:—A 12,500-kW turbo-alternator, with Messrs. C. A. Parsons & Co., Ltd.; four 45,000-lb. boilers, Messrs. Babcock and Wilcox, Ltd.; and engine-room and boiler-house buildings and condensing plant, Messrs. G. & J. Weir, Ltd. The Mersey Power Co. is now giving bulk supplies of current to the Mid-Cheshire Electric Supply Co., the North Wales Power Co., and the Wirral Rural District Council. We have already reported that the Government has guaranteed the principal and interest of a loan for the purpose of these extensions under the Trade Facilities Act.

Monomarks.—Mr. W. Morris, managing director of British Monomarks, Ltd., writing with reference to our notice of the Monomark system (Elec. Rev., July 17th) draws attention to the fact that a trader will use the prefix B.C.M., meaning British Commercial Monomark and the subscription in such cases ranges from two guineas upwards according to the nature of the Monomark. It is the private individual's monomark which uses the prefix B.M. and is 5s. per annum.

E.D.A. Activities. — The British Electrical Development Association has published a brochure (E.D.A. 569) illustrating and describing the exhibition of electrical appliances and the special lighting displays which were arranged by the Association jointly with the E.L.M.A. Lighting Service Bureau at Brighton during this year's convention of the Incorporated Municipal Electrical Association.

Trade Announcement.—Messrs. Allen-Liversidge, Ltd., Victoria Station House, Westminster, S.W.1, have just taken over the sole selling agency for Great Britain and Ireland of the electric welding products of Messrs. Buckley, Saunders and Co., Ltd. (Westminster and Birmingham), including the "Pontelec" resistance welding plant, electric rivet heaters, &c.

The Baghdad Concession.—Agreement Approved.—The amended terms of agreement submitted by Mr. Stanley, representing a London syndicate for the Baghdad Electric Lighting and Tramway Concession, have been approved by the Council of State. The concession will run for 60 years. The military plant is to be bought for approximately £50,000. Fifty per cent. of the net profits from the electric lighting branch of the undertaking and 30 per cent. of the net profits from the tramways are to go to the municipality. The charges per unit will be eight annas to the public and six annas to the Government. —*Financial Times.*

Westinghouse Interests in Japan.—Mr. E. D. Kilburn, vice-president of the new Westinghouse Electric Co. of Japan, recently stated that the objects of the company were to distribute Westinghouse products throughout Japan and to arrange for proper service to the many old, as well as the new, users of Westinghouse apparatus. Adequate stocks would be carried, repair and other service facilities would be provided, and engineering and construction assistance would be supplied to users of the company's products. The staff in Japan would be almost entirely Japanese. It was a simple matter to assemble this staff because there were scores of Japanese engineers who had been employed at the Westinghouse company's works at East Pittsburgh and elsewhere.

Social Event.—On July 18th, the employés of the Saxonia Electrical Wire Co., Ltd., Roan Works, Greenwich, S.E., went for their annual outing to Hastings. A stop was made for lunch at a hotel situated outside Hastings, and after reaching the town a tour was made through the famous St. Clement's caves. Swimming and other amusements on the front filled up the day till 4, when tea was served at the Scotch Café, the managing director, Mr. L. H. Euler, A.M.I.E.E., being in the chair.

Trade Facilities Guarantees.—An official paper issued last week states that the guarantees which have been given by the Treasury under the Trade Facilities Acts, 1921-1924, up to June 30th, 1925, amount to £54,452,936. Recent guarantees include £20,000 (guaranteed as to principal and interest) to the St Austell and District Electric Lighting and Power Co., Ltd. for the erection and equipment of a power station and provision of mains; £1,250,000 to the Benguella Railway Co. (guaranteed as to principal and interest for 25 years) for the purchase of rolling stock and railway materials in Great Britain; and £50,000 to the Nottingham Coal Carbonization, Ltd. (guaranteed as to principal and interest for seven years) for the erection of plant to treat coal by a process of low-temperature carbonisation.

Catalogues and Lists.—Siemens & English Electric Lamp Co., Ltd., 38-39, Upper Thames Street, E.C.4.—Price List No. 132, dealing with all makes of Association radio valves.

The Hendon Electric Lamp Co., 104, Southampton Row, W.C.1.—A price list of "Hendon" lamps of various types.

The Leeds Electrical Construction Co., Ltd., Charmouth Street, Leeds.—An illustrated publication describing a new high-temperature electric furnace with automatic temperature control.

Metro-Vick Supplies, Ltd., Trafford Park, Manchester.—Special Publication No. 7,117/3, describing a new "Cosmos" crystal set. Illustrated and priced.

Super-Centrifugal Engineers, Ltd., Imperial House, Kingsway, W.C.2.—An illustrated pamphlet advertising the "Sharples" "super-centrifugal" oil purifier.

The D.P. Battery Co., Ltd., Bakewell, Derbyshire.—A comprehensive catalogue (112 pp.) of the company's storage batteries for central stations, country houses, institutions, &c. Particulars are given of stands for these batteries, and the catalogue is fully illustrated and dimensioned.

The General Electric Co., Ltd., Magnet House, Kingsway, W.C.2.—The "Osram Bulletin" for July, containing articles and notes on "Osram" lamps and radio valves and their employment.

The Steam Fittings Co., Ltd., West Drayton, Middlesex.—An illustrated and priced pamphlet describing a capacity multiplier for steam traps.

Pope's Electric Lamp Co., Ltd., 5, Arthur Street, New Oxford Street, W.C.2.—A blotter, bearing a calendar for August, advertising "Elasta" electric lamps.

The Jackson Electric Stove Co., Ltd., 143, Sloane Street, S.W.1.—A blotter advertising "Jackson" electric cookers with a calendar for August.

Messrs. Wm. Geipel & Co., Vulcan Works, St. Thomas Street, S.E.1.—A pamphlet illustrating and describing the "Quead" electric cooker; and a revised price of rubber covered wires.

Bankruptcy Proceedings.—A. O. Joyce, 7, Parade, Leamington, Warwickshire, electrician.—The receiving order herein was made recently on a creditor's petition. The statement of affairs shows gross liabilities of £315, of which £310 is expected to rank, against net assets of £19, or a deficiency of £291. Debtor attributes his failure to lack of capital and bad trade. He states that he commenced business on his own account as a radio engineer at the above address in November last. He had practically no capital of his own at the time, and he borrowed £100 from a friend, which remains unpaid. He had got into financial difficulties, and the Sheriff had sold his trade and household effects under an execution. Debtor admits having been aware of his position since two months prior to the date of the receiving order. The first meeting of the creditors was held on July 28th at the Official Receiver's office, Coventry, when the case, being a summary one, was left in the hands of the Official Receiver as trustee.

P. L. Symonds, 40, Victoria Road, Great Yarmouth, electrician.—The public examination of this debtor was held on July 28th at the Town Hall, Great Yarmouth. The statement of affairs showed liabilities of £368, with a deficiency of £21 In December, 1922, the debtor commenced business as an electrician. He took another into partnership, debtor finding £100, which was used to buy stock, and the partner brought in some stock. On December 31st, 1923, the partnership was dissolved, and since 1924 debtor had traded on his own account. He bought £130 worth of radio components, expecting a purchaser, but the purchaser went to another firm, and debtor was left with them on hand. He attributed his failure to overstocking and the decline in the wireless trade. The examination was closed.

E. G. Wicks, electrical engineer, 19, Ruby Street, Bedminster, Bristol.—Trustee, Mr. F. W. Dearle, Official Receiver, 26 Baldwin Street, released June 22nd.

I. Faulkner, 9, Derby Road, Weaste, Salford, electrical engineer, trading as the Provincial Lighting & Engineering Co.—Trustee, Mr. J. G. Gibson, Official Receiver, Byrom Street, Manchester, released July 3rd, 1925.

H. RHODES, trading as the Victoria Electrical Co., Victoria Buildings, Keswick, Cumberland.—Trustee, Mr. K. J. Hough, Official Receiver, released June 28th.

A. WOOD, electrical agent, 67, Bradford Avenue, Cleethorpes, late of Great Grimsby.—Last day for the receipt of proofs for dividend, August 12th. Trustee, Mr. J. F. Wintringham, St. Mary's Chambers, Great Grimsby.

Company Liquidations.—P.S. WIRELESS MANUFACTURING Co., LTD., Ship Street, Brighton.—A meeting of creditors was held on July 27th at Brighton, when Mr. E. Webb, the liquidator in the voluntary liquidation, reported that the liabilities were £609, of which £300 was due to the trade and £309 to the bank. The claim of the bank had been guaranteed by three of the directors of the company. The net assets were £455, showing a deficiency, so far as the creditors were concerned, of £154. The company was registered on March 13th, 1924, with a nominal capital of £2,000, for the purpose of taking over the business previously carried on by Mr. H. L. Smith for the manufacture of radio instruments. The vendor was allotted 1,125 shares in the company as the consideration for the assets transferred, while 760 shares were subscribed for in cash. Preliminary accounts at December last disclosed a loss on the trading of about £200. A considerable amount of experimental work had been carried out. Up to the date of the liquidation there had been a loss on the trading of £718. The deficiency, so far as the shareholders were concerned, was accounted for by the loss on the trading, together with the depreciation written off the assets in the statement of affairs. A resolution was passed confirming the voluntary liquidation of the company, and an advisory committee was appointed, consisting of the representatives of Messrs. Hanningtons, Ltd., and Messrs. Orbell & Kirk.

The following are creditors:—

	£		£
Henderson & Co.	132	Stella Lights, Ltd.	21
Cable Accessories Co., Ltd. ...	25	Bankers	309
Ellis, W.	24		

KLYDO, LTD., 112, Belvedere Road, Waterloo, S.W.1, electric sign manufacturers.—A meeting of the creditors was held on July 27th at the above address. The liquidator of the company, Mr. E. H. Miller, presented a statement of affairs as at July 8th, which showed liabilities of £2,372, and a deficiency of £1,976. The company was formed in March, 1923, but traded without success. An agreement was entered into to fit "Klydo" signs at Wembley. The contracts were not carried out, and the directors of another company at Wembley acquired the shares of Klydo, Ltd., and endeavoured to put it on a sound financial basis, and several sums of money were advanced for that purpose. The trading was still unsuccessful, and accordingly on July 8th the creditors decided upon voluntary liquidation. The creditors decided that Mr. Miller should continue as liquidator.

The following are creditors:—

	£		£
Corbin, Greener & Cook	56	Hetley, James, & Co.	21
Gane, Jackson, Jeffries and Freeman	21	Coenigs & Hammer	62
Coleman, C.	99	Miller, Mills & Bantock	31
Crowden & Keeves	59	Rent	28

ROBB BROTHERS (GLASGOW), LTD., electrical engineers, 11, Bothwell Street, Glasgow.—At a recent meeting of creditors, Mr. A. E. R. Copeland, C.A., the liquidator of the company, presented a statement of affairs which showed liabilities of £2,723 and assets of £987, or a deficiency, so far as the creditors were concerned, of £1,736. The statement showed 8s. 2d. in the £, subject to the expenses of realisation. The company was formed in March, 1921, with a nominal capital of £3,000, of which £2,459 had been issued and was fully paid. During the year to March, 1923, there was a loss on the trading of £64, whilst in the following 12 months to March, 1925, there was a loss of £391. One of the directors of the company stated that they had been endeavouring for some time past to become members of the N.A.R.M.A.T., but had not been successful. As a result, they could not purchase on the same terms as the members of the Association, but had to pay higher prices and resell at the same prices as other merchants. That had the effect of reducing the gross profits which were earned. Last November a quantity of goods were purchased from a company and were found defective. Those goods were returned, and a credit note was given. In the interval a bill given to the suppliers had been transferred to another company, who instituted legal proceedings for the recovery of the value of the bill. As a result, the company became responsible for the bill of £400, and had not received anything to replace the goods which were returned. A resolution was passed confirming the voluntary liquidation of the company, whilst a committee of three of the creditors was also appointed.

E.S. Co., LTD.—Winding up voluntarily. Liquidator, Mr. S. A. Smith, C.A., 11, Queen Victoria Street, E.C.4. A meeting of creditors is called for August 14th.

COVENTRY WIRELESS SUPPLIES, LTD.—Winding up voluntarily. Liquidator, Mr. H. M. James, I.A., 14, High Street, Coventry. A meeting of creditors was called for August 5th. Particulars of claims to be sent to the liquidator, Mr. H. M. James, 14, High Street, Coventry, by September 3rd.

ELECTROPHONE, LTD.—Winding up voluntarily.

SOUTH-EASTERN AND CHATHAM CONSTRUCTION AND POWER Co., LTD.—Winding up voluntarily. Liquidator, Mr. R. D. Heckels, 65, Coleraine Road, Blackheath, S.E.3. A meeting of creditors is called for August 14th. These notices are purely formal; all creditors have been or will be paid in full.

RADIO INSTALLATIONS, LTD.—A meeting of members is called for September 2nd, at 14, St. Mary Axe, E.C., to hear an account of the winding up from the liquidator, Mr. G. W. Askew.

BISHOP'S CASTLE ELECTRIC LIGHT & POWER Co., LTD.—Mr. G. H. Hewitt, a creditor, has presented a petition for the winding up of this company. The application will be heard at the County Court, Leominster, on August 10th.

RODERICK ELECTRIC SUPPLIES Co., LTD.—Meeting of creditors, August 10th, at 19, Eastcheap, E.C.3. Liquidator, Mr. W. H. Cork.

ENGLISH RADIO CORPORATION, LTD.—A meeting of members is called for September 1st to hear an account of the winding up from the liquidators, Messrs. C. H. Baker and A. H. Whalley, at their offices, 12, South Parade, Leeds.

Private Arrangements.—D. G. NICHOLAS, radio specialist, 14, Victoria Square, Aberdare.—The creditors interested herein were called together recently at the offices of Messrs. Clarke, Dovey & Co., Cardiff, when Mr. S. E. Clutterbuck submitted a statement of affairs which disclosed liabilities of £469. The indebtedness to the trade was £429. The assets totalled £113, leaving a deficiency of £356. It was reported that the debtor commenced business in October, 1923, without capital, his father guaranteeing the bank up to £20. The debtor had at various times borrowed from his father sums of money totalling £40, which were still outstanding. At the outset the turnover averaged about £20 to £25 a week, but it had since fallen to £10 weekly. The total weekly expenses had averaged £6 10s. The debtor attributed his present position to want of capital and depreciation in the value of stock.

The debtor's solicitor made an offer of 5s. in the £, which was not accepted, and it was decided that the debtor should be given time within which to find security for the payment of a composition of 10s. in the £ by two equal instalments at one and three months. It was also decided that the composition should be paid under a deed in favour of Mr. S. E. Clutterbuck.

The following are creditors:—

	£		£
Aberdare U.D.C.	37	Metro-Vick Supplies, Ltd. ...	25
Brown Bros., Ltd.	36	McTaggart, H., & Co.	26
Cleave, H. R., & Co.	23	North British Rubber Co. ...	21
Houghtons, Ltd.	25	South Wales Wireless Installation Co., Ltd.	27
General Electric Co., Ltd. ...	77		

H. LEAKE, trading as Harold Leake & Co., 13, Garden Street, St. Annes-on-Sea, electrician, &c.—The creditors interested herein were called together on July 24th at the offices of Messrs. J. B. Boyd, Wrigley & Co., C.A., Manchester, when a statement of affairs was presented which showed liabilities of £3,216, of which £2,044 was due to the trade. There were partly-secured cash creditors for £1,572, who held securities valued at £400, leaving £1,172 to be included with the ranking liabilities. The assets were estimated to realise £3,026, less £79 for preferential claims, leaving net assets of £2,947, or a deficiency of £269. It was stated that the debtor had been in business for a considerable period, and apparently was able to trade successfully until a year or two ago, when he felt the effects of the bad trade in the locality. A balance-sheet was prepared last January, and it showed a surplus of assets over liabilities. The turnover for the last six months was thought to have been about £1,200, but for 1924 it amounted to £6,490. Three creditors had commenced proceedings, and a deed of assignment had already been executed to protect the assets. It was decided to confirm the deed already executed, and a committee was appointed. The trustee and committee were empowered to reassign the estate for a sum sufficient to pay a dividend of not less than 10s. in the £.

Dissolutions of Partnership.—WESTERN MANUFACTURING Co., radio factors, Lydney, Glos.—Messrs. W. K. Coxon, A. S. Prosser, and E. R. Weare have dissolved partnership. Debts will be attended to by Messrs. Coxon & Weare.

NYMAN & Co., THE DIRECT WIRELESS Co., and the WIRELESS HOSPITAL, Leeds.—Messrs. S. M. Nyman and R. Scott have dissolved partnership. Debts will be attended to by Mr. Nyman, who will carry on business as Nyman & Co. and the Wireless Hospital. Mr. Scott will trade alone under the style of the Direct Wireless Co.

Hungarian Electrical Imports.—The *Board of Trade Journal* publishes a table showing the sources of imports into Hungary during 1924. Included in this is the item "electrical machinery," in which Germany is shown as the principal supplier (5,052 quintals), being followed by Austria (4,459 quintals). The United Kingdom provided only 32 quintals, Czecho-Slovakia 810 quintals, and Italy 118 quintals.

Coal Stoppage Averted.—As a result of Government intervention, the complete stoppage in the mining industry which was threatened upon the expiry of the existing agreement on July 31st was averted. The Government has undertaken to make good any losses in the industry for a period during which a Committee of Inquiry will make a thorough investigation of the position of the industry.

For Sale.—The Ayrshire Electricity Board invites offers for a complete private lighting generating plant. Owing to the installation of larger plant, the Sutton Coldfield Corporation Electricity Department invites offers for one d.c. feeder booster, complete with switchgear. Mr. H. J. Shaw will sell by auction on August 25th at 85, Newington Causeway, S.E., the stock of an electrical goods factor. (See our advertisement pages to-day.)

Book Notices.—" The Structure of Light," by Sir J. J. Thomson, O.M. Pp. xii + 38; figs. 8. London: Cambridge University Press. Price 2s. 6d. net.

" Selected Papers from the *Journal* of the Institute of Electrical Engineers of Japan."—No. 5, " Jump in the Self-Excitation of d.c. Generators." No. 6, " New Method for Electrical Machine Design."

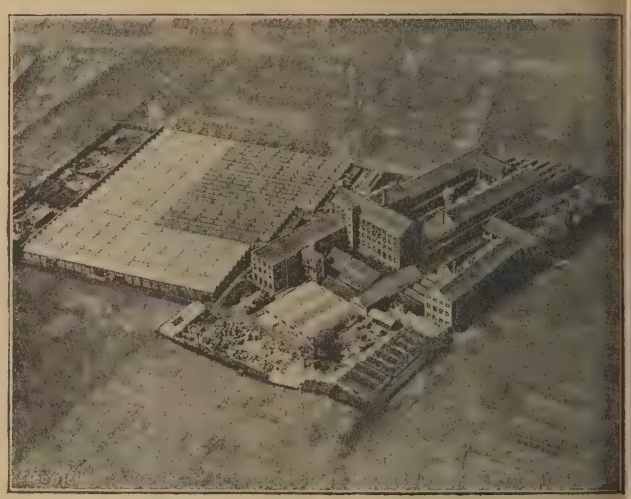
" Quarterly Bulletin of the British Cast Iron Research Association," No. 9, July, 1925.

" Fuel Economy and Smoke Prevention," by J. B. C. Kershaw, F.I.C. Pp. xiv + 268; figs. 91. London: Constable and Co., Ltd. Price 16s. net.

Electricity Meter Approved. — The Electricity Commissioners have approved the Metropolitan-Vickers Type " N.A." single-phase watt-hour meter in rated sizes from 2.5 to 20 A, at from 100 to 600 V, frequency 50 cycles.

United States Electrical Exports.—Although the value of the United States electrical exports during May ($7,198,803) was greater than that for May, 1924, the total for the first five months of the current year was about $1½ million less than in the equivalent period of last year. A comparison of the May exports with those of the previous May shows that generators, steam turbo-generators, and generator parts and accessories decreased by about 12 per cent., storage batteries by 17 per cent., transformers by 62 per cent., rectifiers, motor-generators and converters by about 50 per cent., electric locomotives by 72 per cent., protective devices by 71 per cent., railway motors by 50 per cent., fans by 59 per cent., electric furnaces and ovens by 86 per cent., and telegraph apparatus by over 50 per cent. On the other hand, increases occurred in the following items:—Primary batteries 35 per cent., meters 31 per cent., stationary motors, over 200 h.p., 65 per cent., flashlamps 80 per cent., motor-driven household devices 32 per cent., domestic heating and cooking appliances 40 per cent., radio apparatus 130 per cent., telephone switchboards 190 per cent., bells, &c., 70 per cent., ignition apparatus 105 per cent., lighting fittings 53 per cent., bare copper wire 190 per cent., insulated copper wire 10 per cent., and carbons 30 per cent.

Electricity v. Gas for Heating.—Messrs. Automatic and Electric Furnaces, Ltd., writing with reference to the remarks of Mr. D. Milne Watson at a recent " gas " meeting, reported in our issue of July 24th, say it is not surprising that engineering industries are not satisfied with electric power and lighting only. The economy effected in heating is best shown by the following tests, carried out by two engineering establishments, one in a " Wild-Barfield " electromagnetic furnace and the second in a gas furnace. The company gives the following figures:—



Electricity.	Gas.
Output per hour, 29.75 lb.	33 lb.
Consumption per hour, 3.41 kWh	250 cu. ft.
Price, 1d. per kWh	3s. 11d. per thousand.
Cost per lb. of steel, .1185d.	.355d.
Hardening cost per ton, 22s.	68s.

It will be seen from the foregoing that gas for hardening costs 3.08 times as much as electricity.

The German Electrical Industry.—The *Deutsche Bergwerks Zeitung* says that the rising movement in electrical shares which began early in July has directed attention to the business situation in the electrical industry. This industry is one of the few branches of German industry which are at present doing good business. Endeavours are now being made to make up for what had to be neglected during and since the war; works are completing and modernising their electrical equipment; existing power plants are being extended, and new plants built. According to a report of the Berlin Chamber of Commerce and Industry, the chief feature of the electrical industry during the past quarter has been the conflict between the urgent needs for electrical material and the lack of money and credit. Where these difficulties were not felt directly, as at electricity works and in the tramway undertakings, a large number of orders were given. In many other branches of industry extensions of plant were undertaken but generally, owing to the difficulty of procuring money, caution was observed. Business with the mining industry has been very quiet. On the whole, sales of cable, machinery and apparatus, meters and small material were satisfactory, and employment is assured for some months. There was a lively demand for measuring instruments for switchboards, heating apparatus, laboratories, and medical apparatus. Sales of telegraphic material were less satisfactory, and business declined further. Comparatively little business was done with manual telephone exchanges, but large orders were received for automatic exchanges. Sales of telephone apparatus to official and private customers were satisfactory. In the radio industry employment was good during May, but since that month the usual summer slackness has prevailed. Manufacturers of railway safety apparatus and electrical carbon products still complain of bad business. Sales of electric lamps have developed not unfavourably, but have been hindered abroad by the high Customs duties.—*Reuter's Trade Service* (Essen).

The Austrian Electrical Industry.—Until recently the electrical works of Austria were working at full capacity owing to the electrification of railways in the Tyrol and Upper Austria. As, however, these works are nearing completion, and some contemplated electrification works have been cancelled, some of the large works are suffering from a shortage of orders and have had to reduce their working hours as the only alternative to the dismissal of employés. The manufacturers entertain the hope that if the American investment credit is established the State will give them large orders for the extension of the telephone and telegraph services. The exportation of motors, dynamos, and other heavier electrical appliances is unsatisfactory owing to the competition of Germany, Czecho-Slovakia, and, lately, Poland. All these countries are able to underbid Austrian exporters, wages being much higher in Austria owing to the power of the trade unions. The most flourishing branch of the electrical industry is the radio apparatus section, which is progressing rapidly. It is noteworthy that while Austrian prices are relatively high for heavy electrical apparatus, they are low for " weak-current " appliances such as electrical toys, hand lamps, radio accessories, valves, telephones, &c. There is a huge export of the latter class to the Near East countries, Austria having very advantageous commercial treaties with these.

A Factory from the Air.—Aerial photographs have lost their novelty nowadays, but we think that the accompanying view of the Automatic Telephone Manufacturing Co.'s works at Liverpool is of interest, having regard to the importance which the company has acquired as a contractor for the provision of automatic telephones in Greater London. As viewed from the air, this extensive factory suffers from perspective, for the considerable expanse of roof ridges in the left of the picture covers one of the largest machine shops and switchboard-erecting shops in the North of England, in addition to housing certain of the assembly departments.

The Automatic Telephone Co.'s Manufacturing Works, Liverpool.

framework shop, &c. The ground area occupied is 9½ acres, the total floor area being over 270,000 sq. ft. The multi-storey buildings on the right are mainly given over to assembly, stores, packing, &c., and include an extensive suite of offices in the foreground. The large orders which are being secured for " Strowger " equipment have necessitated extensions which are now in progress. Among the orders now being executed at the works, in addition to British Post Office requirements, are " Strowger " telephones and equipment for Sydney (N.S.W.) and for the restoration of the Tokio telephone system, which was wrecked by the 1923 earthquake and fire, as well as for the Buenos Aires system. The works employ over 3,500 workpeople.

Radio Apparatus in Switzerland.—In a recent note upon the position of broadcasting in Switzerland, *Commerce Reports* states that the completion of the Basle station will give an impetus to the demand in Switzerland for radio apparatus. The local market is stocked at present with radio sets of French and German manufacture, although a limited quantity has been supplied by British firms. So far as is known, no American radio sets are at present in operation in Basle. Receiving sets now on sale in Basle retail at from 200 to 800 Swiss francs. The cheaper sets have not proved very satisfactory.

Lamp-Makers' Publicity in France.—A number of electric lamp manufacturers in France have recently joined together in a co-operative publicity scheme urging electric light users to support the French industry by only buying lamps which are really French. The announcement adds that the purchase of foreign lamps injures the credit of France.

Unemployment.—The " live " registers of the Employment Exchanges showed at July 20th a total of 1,221,900 wholly unemployed persons. This figure was 26,566 less than a week previously, but 180,116 more than in July, 1924.

German Lamp Patents in Belgium.—Before the war the Osram Gesellschaft, of Berlin, held certain Belgian patents in respect of incandescent lamps which were produced and sold by the A.E.G. This concern had a branch in Brussels which, when war broke out, was sequestrated by the Belgian Government and sold to a Ghent company. The Osram Company brought an action with respect to the patents, but lost the day in two lower courts. A final appeal was made to the Court of Cassation which, according to the *Elektrotechnische Zeitschrift*, has given a verdict in its favour, basing its decision upon the fact that patents are intellectual and not material properties, and are consequently not seizable either under the Versailles Treaty or the Belgian law.

Spanish Electrical Extension.—The Compania Sevillana de Electricidad, Seville, which is a large factor in the hydro-electric situation in south-west Andalusia, plans to spend 10,000,000 pesetas for extensions, involving the purchase of a considerable amount of electrical equipment of foreign manufacture.—*Commerce Reports.*

British Trade Mark Applications. — The following are among the recent applications for British trade marks. Objections against any of the proposed marks may be entered within one month from July 29th :—

Cyldon. No. 458,685. Class 8. Philosophical and scientific instruments and apparatus for useful purposes.—Sydney Sam Bird, manufacturing electrical engineer, Sarnesfield Road, Enfield Town, Middlesex.

Dubilier (lettering and design). No. 458,873. Class 8. Electrical condensers, resistances, and variometers. No. 458,874. Class 13. Electrical switches (ordinary). No. 458,875. Class 16. Electrical porcelain insulators. No. 458,876. Class 50. Electrical mica insulators.—The Dubilier Condenser Co., Ltd., Ducon Works, Victoria Road, North Acton, London, W.3.

Amplion. No. 459,481. Class 8. Telephonic apparatus.—Edward Alfred Graham, trading as Alfred Graham & Co., St. Andrew's Works, Crofton Park Road, London, S.E.4.

Carmalite. No. 459,448. Class 8. Apparatus for use in wireless telephony and telegraphy.—Merchants and Agencies, Ltd., 45, Basinghall Street, London, E.C.2.

Oliverna. No. 459,512. All goods in Class 8.—John Alfred Cockett, 74, Chestnut Avenue, Walthamstow, E.17.

Zigzag. No. 459,639. Class 8. Electric batteries.—W. A. Buckley & Co., Ltd., 137-138, Moorgate Station Chambers, London, E.C.2.

Kallede. No. 459,720. Class 40. Electric wires covered with india-rubber.—Callender's Cable & Construction Co., Ltd., Hamilton House, Victoria Embankment, London, E.C.4.

The Brazilian Electrical Market.—A recent *Commerce Reports* note stated that the Brazilian market for electrical goods was dull. Slowness in buying was attributed to anticipated technical improvements. Germany's competition was active on a price basis. The electrification of the Central Railway is in abeyance pending the forthcoming of the necessary funds.

A Brazilian Railway Contract. — It is reported that the Metropolitan-Vickers Electrical Co., Ltd., was the sole tenderer for the electrification of the branch line of the Oeste de Minas Railway, Brazil, from Barra Mansa to Augusto Pestana —a distance of 73 km. A seven-year loan has been granted to the State for this work.

Annual Holidays.—The works of MESSRS. S. H. HEYWOOD AND CO., LTD., will be closed from August 8th to 17th.

New Italian Companies. — A new electrical engineering company has lately been formed at Saronno with a capital of 30 million lire and the title La Societá per Costruzioni Elettromeccaniche "Cemsa." A number of new electrical engineering and electricity supply companies were also formed during last month.

New Belgian Companies.—Among the recently-constituted Belgian companies are the following :—Gaz et Électricité de Herstal (Brussels), capital four million fr., to produce and distribute electricity and gas for all purposes; and l'Electricité de la Lesse (Anseremme), capital 300,000 fr.

Manufacturing in Argentina. — The *Review of the River Plate* says that in embarking upon manufacturing, Argentina has been able to take advantage of the accumulated experience of other countries. The Argentine manufacturing industries are for the greater part working with up-to-date machinery for the simple reason that it is only within the last six years or so that the industries employing this machinery have come into being. There are few manufacturing or power-producing plants built ten years ago which could remain efficient without complete renovation in the light of the progress which has been made since their inauguration. A committee appointed by the Department of Navigation and Ports has reached the conclusion that certain falls in the province of Corrientes could, with an outlay of a little over $100,000,000 on plant and installation, be made to yield electrical energy of which the provinces of Corrientes, Entre Rios, and Santa Fé, as well as the Federal capital, could draw almost unlimited supplies. Our contemporary points out, however, that there are other more easily realised and more urgent schemes to be attended to first.

Threatened Tramway Strike.—The introduction of motor-omnibuses by the Stalybridge Joint Tramways and Electricity Board has caused a disaffection amongst its tramway employés. Their principal grievance is that tramwaymen are being replaced and that the wages paid to omnibus drivers are lower than those paid to tramcar drivers. It was reported that seven days' notice had been given, to expire on Wednesday midnight (August 5th), of the men's intention to cease work unless certain conditions were agreed to by the Board.

Lighting and Power Notes.

Algeria.—HYDRO-ELECTRIC DEVELOPMENT.—A Government inquiry was recently held in connection with a project to utilise the water power of the Upper Cheliff river between Boghari and Lavigerie for electrical purposes. It is proposed to build several dams to form storage reservoirs, the first of which would be near the Gribbs Gorge above Dolfusville (Amoural). The dam would be nearly 200 ft. high and would form a reservoir of a capacity of approximately 50,000,000,000 gal.

Australia.—MELBOURNE.—*Year's Working.*—We have received from Mr. W. H. Alabaster, city electrical engineer, a copy of his report together with the statement of accounts on the working of the electricity undertaking for the year ended December 31st last. The revenue account records a total income of £458,307, as compared with £437,905, and working expenses of £281,626, as against £276,407. The gross profit was thus greater by £15,184 at £176,682. After providing for capital charges, there was a net surplus of £64,656, as compared with £61,997, of which £25,000 was allotted to the city fund. During the year £147,950 was spent on capital account, the chief items being £75,615 for mains, £22,086 for machinery, and £14,603 for sub-stations, transformers, &c. The sales of electrical energy increased by 914,792 kWh to 65,491,808 kWh, and the maximum supply demanded from 25,700 to 28,100 kW. The load factor showed an improvement of 7.03 per cent., at 31.99 per cent. During the year arrangements were completed for the taking over by the Council of the Melbourne Hydraulic Power Co.'s undertaking.

GREATER BRISBANE.—The Town Council has received a report from the Electric Light, Power and Transit Committee with regard to the erection of a super-power station to meet the needs of Greater Brisbane, in which it is recommended that before proceeding with the scheme, preliminary negotiations be entered into with the City Electric Light Co., Ltd., for the acquisition by the Council of the undertaking, the Committee being of opinion that the electricity company's supply in the area should be controlled by the Council. The recommendation has been adopted, and a proposal to borrow £10,000 for the completion of the Ithaca lighting scheme has also been approved.

Bethesda.—PROPOSED SCHEME HELD UP.—Some time ago the Urban Council decided to provide electric light for the district, a scheme being approved which would cost about £8,000. Opposition arose, and an inquiry was proposed. The Gwynedd Trust offered to work on its own account, but owing to considerable delay in the holding of the inquiry the Trust withdrew its offer. As a result the Electricity Commissioners have announced that they will not hold an inquiry, and the project is in abeyance.

Birkenhead.—TEMPORARY SUPPLY.—The Electricity Committee has considered the question of obtaining a temporary supply of current to cope with the load during the forthcoming winter. The electrical engineer has reported that Messrs. Cammell Laird & Co. have agreed to give such a supply by arrangement for an interchange of current, and the Committee has agreed to an interchange of current whereby an additional supply of 1,000 kW will be available to the Corporation for the forthcoming winter at the price charged by the Corporation for any current supplied to the company. The engineer has been authorised to provide the necessary transformer, main connections, and switchgear at an estimated cost of £850.

LOAN.—Sanction has been obtained to a loan of £39,682 for electricity purposes.

ELECTRICITY AGREEMENT.—The Electricity Committee has received from the Town Clerk of Liverpool, an intimation that his Committee is unable to recommend the City Council to accept the amendments of the Birkenhead Council in the terms and conditions of the proposed agreement for the supply to Birkenhead of electricity in bulk.

Brighton.—YEAR'S WORKING.—The accounts of the Corporation electricity undertaking (engineer, Mr. John Christie) for the year ended March 31st last, show a total income of £201,095, as compared with £185,017 in the preceding year. Working expenses totalled £134,939, as against £130,551, leaving a gross profit of £66,156 (£54,466). After deducting capital charges there was a net surplus of £23,646, to which was added a balance from the previous year of £13,492, making a total of £37,138. Of this amount, the surplus from the preceding year was contributed to the borough fund, and the remainder carried forward. During the year £53,721 was spent on capital account, the chief items being £12,992 for machinery and plant, and £24,633 for mains. The sales of electrical energy increased from 15,666,907 to 18,122,667 kWh, and the average price per kWh obtained fell from 2.57d. to 2.42d. The maximum supply demanded rose from 10,200 to 11,400 kW.

Cambridge.—PURCHASE OF UNDERTAKING.—The Town Council in May last decided to take steps to acquire the local electricity undertaking owned by the Cambridge Electric Supply Company, but the company states that it is advised that the right of purchase given to a local authority cannot be exercised without the consent of the Electricity Commissioners, which the Council has not received. In the circumstances the Electric Supply Committee has recommended that no further steps be taken in the matter at present.

Chile.—Electrical Development.—The Compania Chilena de Electricidad is now operating two hydro-electric and one steam-operated power stations with a total capacity of 60,000 kW. By means of 110,000-, 44,000-, and 12,000-V h.p. lines, and 220-, 380-, and 440-V l.p. mains, the company is supplying electricity to over 30,000 consumers in the Santiago district and in the Aconeagua Valley.

Clitheroe.—Electricity Scheme.—At a recent meeting of the Town Council, Councillor J. Bootham submitted the estimate of Mr. Hawtayne, consulting engineer to the Corporation in connection with the proposed supply of electricity to the borough. This covered three years, the estimated capital expenditure during the first year was £17,880, second year £7,720, and third year £7,000, a total of £32,000. It was decided to apply for sanction to borrow the last amount.

Special Order.—The Electricity Commissioners have submitted to the Minister of Transport for confirmation an Order made by them for the supply of electricity by the Town Council within the borough and part of the rural district.

Continental.—Italy.—A 12,000-kVA three-phase alternator built by the Società Ansaldo, of Cornigliano Ligure, has recently been installed at the Rovesca power station of the Società Generale Edison di Elettricita, in Milan.

France.—In order to meet the increasing demand two new boilers and additional 45,000/10,000-V transformers are being installed at the Comines generating station of the Société de l'Energie Electrique du Nord de la France. When the work in hand is completed the plant will have a total capacity of 60,000 kW.

Spain.—La Sociedad Electrica del Viesgo has applied to the Spanish Government for authority to establish a 95,000-V transmission line between its hydro-electric stations at Urdon and Camarmena.

A large hydro-electric plant for the municipality of Murcia is shortly to be erected by the Seville Electric Co., which controls all hydro-electric facilities in South-West Andalusia. The estimated expenditure is 10,000,000 pesetas; a large amount of foreign equipment will be purchased.—*Reuter's Trade Service* (Bilbao).

Germany.—It is reported that the Siemens-Schuckert Co., of Berlin, has contracted to construct and finance a big electricity distribution system extending over the whole of the Gross-Strehlitz district of Upper Silesia.

According to a report recently issued by the Berlin Stadtische Elektrizitatswerke, the cutput of the electricity stations last year amounted to 462 million kWh, an increase of 26 millions over 1923. In order to provide for the rapidly increasing demand, plans have been prepared for the establishment of a large new power station at Rummelsburg, to finance which it is reported, efforts are being made to raise a loan in the United States.

Edinburgh.—Price Reductions.—The Corporation Electricity Committee has recommended the following reductions in the charges for electricity:—Ordinary power rates: For the first 1,000 kWh, from 2d. per kWh to 1.5d., while as against the old charge of 1d. for the next 39,000 kWh, it is proposed to substitute a rate of .85d. for the next 30,000, and the charge of .75d. per kWh under the old scale to consumers of over 40,000 kWh, is to be extended to users of over 31,000 kWh. The Committee has approved of a proposed special power rate for the lighting of shop windows after closing hours.

Erith.—Electricity Supply.—The new agreement with the Woolwich Town Council for a bulk supply of electricity having been finally settled, the Urban District Council has received sanction to a loan of £13,910 for the duplicate main transmission line.

Herne Bay.—Inquiry.—Col. T. C. Ekin held an inquiry on July 28th into the application of Messrs. Hunt & Sons for an Order to supply electricity in the urban district and in the parishes of Herne and Reculver, and into an application by Major B. Prescott-Westcar, of Strode Park, for a Special Order to supply electricity in the parish of Herne south of the Southern Railway. For Messrs. Hunt & Sons, Mr. Jacques Abady said that the area scheduled by Major Prescott-Westcar was subsequent to that of Hunt & Sons. The dispute was therefore as to whether Hunt & Sons' area should be cut short by the railway line or should include Herne and Reculver south of the railway as originally scheduled. It was intended to take a bulk supply of electricity from the Canterbury City Council. After a conference it was announced that the dispute had been settled on terms. The result was that the application of Major Prescott-Westcar was withdrawn, as also was the opposition to the application of Messrs. Hunt and Sons.

Ilkley.—Street Lighting.—The street lighting in the town is being converted from gas to electricity.

India.—Hydro-Electric Development.—On July 21st, according to the *Daily Mail*, Lord Goschen, Governor of Madras, turned the first sod of the great Metur dam and irrigation scheme designed to provide irrigation for 400,000 acres, and costing more than £2,000,000. The project consists of a masonry dam 200 feet high and 6,352 feet long on the Cauvery, and an 80-mile main canal and distributors. Important hydro-electric development proposals in connection with the dam are under consideration.

Jersey.—Power Station Inaugurated.—The first power station to be constructed in Jersey was formally inaugurated at Albert Pier on July 27th by the President of the Piers and Harbour Committee.

Kent.—Electricity Order.—The London Electric Supply Corporation, Ltd., is to apply to the Electricity Commissioners for an Order to supply electricity in bulk to the West Kent Electric Co., Ltd., and the Kent Electric Power Co., Ltd.

Lancaster.—Electricity Schemes.—The Town Council is applying to the Unemployment Grants Committee for assistance in respect of a scheme for the extension of the h.p. feeder cable from Bralk to Bowerham sub-station, and for the purchase of two transformers and the alteration and extension of the switchgear at the sub-stations at a cost of £6,000; also for laying l.p. mains in various parts of the borough at a cost of £4,000. Sanction to borrow £10,000 will be applied for.

Leeds.—Electricity Agreement.—The Electricity Committee has agreed to terms with the Yorkshire Electric Power Co. for an interchange of electricity supply at Farsley.

London.—St. Pancras.—The Electricity Committee is applying for sanction to loans of £21,340 for mains, £3,500 for meters, and £1,500 for domestic apparatus.

Sanction has been received to the borrowing of £11,700 for mains and £17,135 for converters and switchgear.

The report on the working of the electricity undertaking (engineer: Mr. S. W. Baynes) for the year ended March 31st last shows an income of £214,391, against £213,299 for the year 1923-4. The working costs amounted to £120,560, against £111,204, leaving a gross profit of £93,830 (£102,094). The net result of the year's working is a profit of £18,157, against £31,500 for the preceding year. The capital expenditure during the year amounted to £114,959 paid out of loan, plus £658 paid out of revenue, bringing the total capital expenditure up to £1,062,224. The energy sales amounted to 21,047,231 kWh, compared with 19,548,215 for the previous year. The maximum demand was 13,493 kW, an increase of 1,999 kW, and the average price per kWh during the year was 2.35d.

Southwark.—The Committee of Local Authorities Owning Electricity Undertakings has decided that it will be more economical for the Southwark Borough Council to extend its generating station than to take bulk supplies from authorities or companies, and representations are being made to the Electricity Commissioners accordingly.

Hammersmith.—A fire which occurred at the switchboard of the Borough Council's electricity works disorganised the electricity supply of the district for two hours on July 31st, light and power being cut off until the defect was remedied. Four of the works employés were overcome by fumes and were treated at West London Hospital, but soon recovered.—*Times.*

Morecambe.—Electricity Supply.—The borough electrical engineer has reported that generation of electricity at the old Woodhill Lane station of the Corporation has now entirely ceased and all the energy used by the town is supplied under the joint scheme from the Lancaster generating station. A sub-committee has been appointed to offer the Woodhill Lane plant for sale.

Offices and Showroom.—The Electricity Committee has appointed a sub-committee to arrange for the provision of central offices and showroom for the Corporation's electricity distribution undertaking.

Ramsbury.—Electricity Scheme.—The local Council has appointed a committee to consider a scheme for public lighting by electricity submitted by a Mr. Smith, who has stated that he is prepared to put down plant providing for 1,000 lamps.

Seaham Harbour.—Electricity Supply.—The Urban District Council has under consideration a scheme for a supply of electricity to the town.

South-East Lancs. Electricity Board.—Schemes Recommended.—Proposals by the Oldham Corporation for the erection of a new power station at Chadderton were considered at the last meeting of the Engineering, Advisory and Finance Committees of the South-East Lancashire Electricity Board, which decided to recommend the Electricity Commissioners to sanction the erection of the station. The following plant and mains extensions received approval:—Manchester Corporation, six 33,000-V cables (two of them to be laid only if financial assistance is granted by the Government); Stockport Corporation (two 10,000-kW turbo-alternators, to be installed in two sections); and other applications from the Bury and Buxton Corporations, and the Lancashire Electric Power Co. (Radcliffe station).

Willesden.—Loan Sanctioned.—The Urban District Council has obtained sanction to borrow £2,698 for the erection of a transformer station at Churchill Road.

Wimbledon.—Loan Sanctioned.—The Electricity Committee has obtained sanction to borrow £47,000 for mains and services, and £8,500 for transformers and sub-station equipment.

New Plant.—The Committee has recommended the installation of plant of 3,000-kW capacity, and is seeking sanction to a loan of £20,000 for the purpose.

Sub-Stations.—Sites are to be secured on the Merton Park estate for the erection of transformer sub-stations.

York.—Electricity Charges.—The Electricity Committee has recommended to the City Council that the charge for a supply of electricity to an electrically-fitted four bedroomed house be 10d. per week, plus a "unit" charge of ¾d.

Tramway and Railway Notes.

Continental.—SPAIN.—Application has recently been made to the Spanish Government for a concession in respect of a projected electric railway between Renteria, Lezo and Pasages de San Juan. A line is also to be constructed between Lezez and Ferreira, province of Pontevedra.

GERMANY.—A company has recently been formed, and is receiving the support of the provincial authorities concerned, for the purpose of constructing a high-speed electric railway between Cologne and Dortmund. The estimated cost of the line is approximately 15 millions sterling.

Doncaster.—TRANSPORT CONFERENCE.—A private conference was held at the Doncaster Mansion House, last week, as to whether the tramway track to Bentley should be relaid or the system replaced by a railless-car service or motor 'buses. The conference was attended by a representative of the Ministry of Transport, members of the West Riding County Council, the Doncaster Corporation, and the Bentley Urban District Council.

Dover.—RAILLESS CARS.—The Tramways Committee has recommended to the Town Council that application be made for powers to run railless cars in the borough.

Dudley.—TRAMWAY ROUTE TO CLOSE.—It is reported that the tramway between Dudley and Wordsley is to be abandoned and a motor-omnibus service substituted.

London.—ACCIDENT.—A number of passengers were injured in a tramcar smash which occurred on July 31st at Dog Kennel Hill, East Dulwich. One of the tramcars had nearly reached the top of the hill, when it started to run backwards. The brakes were applied, but failed to act, and the car ran into a stationary car at the bottom of the hill. Of the injured, only the driver of the stationary car was detained at King's College Hospital.

LONDON ELECTRIC RAILWAY ORDER, 1925.—The Minister of Transport has approved and proposes to issue an Order authorising the London Electric Railway Co. to acquire land at King's Cross for the construction of railways and works described in the Order.

Leeds.—FARES.—The tramway manager (Mr. W. Chamberlin) has recommended to the Committee that the tramway fares be reduced as follows:—Maximum fare to 3d.; 3d. fares to 2½d.; 2½d. to 2d.; the penny fares to remain as at present.

Salford.—THROUGH RUNNING.—The Tramways Committee has recommended the Town Council to support a proposal for the through-running of tramcars from the borough to Middleton *via* Rhodes. Negotiations are proceeding with Manchester Corporation in this connection.

Telegraph and Telephone Notes.

"Beam" Radio Station.—PROGRESS.—The Marconi Co. expects to complete the Post Office "beam" wireless station at Borth Petherton, near Bridgwater, on a site of about 300 acres, by the end of September, says *The Times*. It will consist of two sections, one of which will be used for receiving communications from Canada and the other from South Africa. Each aerial system will be supported by five steel lattice masts, 400 ft. high, 12 ft. square at the base, and 139 ft. apart. Fifteen feet from the top of each will be a cross-arm support, from which will hang the aerial and reflector wires. The transmitting station for the system is in course of erection at Rhondda.

Brazil.—NEW RADIO STATION.—The American, English, French, and German Consortium has obtained the approval of Brazilian authorities to construct a large radio-telegraph station at Pernambuco, says *T. & T. Age*. The Minister of Marine has approved the project, and construction will commence as soon as arrangements can be made with contractors. The station is to have seven towers, each 150 metres high, and will be used primarily as a receiving relay station between the United States and Europe, on the one hand, and Rio de Janeiro and Buenos Aires, on the other, and is regarded as necessary to maintain uninterrupted service, because of poor receiving conditions at Rio. The station will be equipped to communicate directly with both the United States and Europe, and it will take from 18 months to two years to finish.

Czecho-Slovakia.—RAILWAY TELEPHONY.—From Prague it is reported that negotiations are in hand for the installation of the Huth telephone system on one of the express trains of the Czecho-Slovakian State railways in order to enable passengers to make telephone calls while travelling.

France.—TELEGRAPH CONGRESS.—An International Telegraph Congress is to be opened in Paris on September 1st; among the matters to be dealt with is the revision of the international telegraph agreement.

Germany.—LONG-DISTANCE TELEPHONY.—A direct long-distance telephone line has been established between Posen and Berlin, *via* Frankfurt on Oder, and an effort is also being made to establish direct communication with Breslau.

Italy.—RADIO-TELEGRAPHY.—The Compania Italo Radio, which is now exploiting the Italian radio-telegraph system, has recently established regular communication between Italy and the United States.

Pacific Cable.—DUPLICATION SURVEY.—It is reported that the cable steamer *Isis* was to leave New Zealand early this month on a surveying expedition in connection with the duplication of the Pacific telegraph cable from Fiji to Vancouver.

The Telephone Service.—KIOSK EAVESDROPPERS.—A device to prevent eavesdropping outside telephone call-boxes is being tried at Fleetwood Post Office. Fleetwood uses the trunk lines more than any other Lancashire town, as most of the business of its fishing industry is transacted over the telephone, and complaints have been received that people outside the telephone call-boxes overheard conversations, thereby obtaining important business information. The Post Office, therefore, has installed a "buzzer," which comes into operation as soon as the caller closes the door. It cannot be heard inside the box, but prevents those outside from overhearing the conversation.

PHONOGRAMS.—The postal authorities in Leeds have inaugurated the acceptance of telegrams through ordinary slot-meter telephone call boxes, the user paying the telephone call and telegram fees into the box in pennies. Liverpool followed suit on August 1st, and the scheme, which is being tried in Manchester, will be extended if successful.

Radio Notes.

Czecho-Slovakia.—NEW STATIONS.—An American firm has obtained a contract from the Ministry of Posts and Telegraphs, says *Commerce Reports*, for constructing a broadcasting station in Prague, to be completed within six months at a cost of 3,000,000 Czech crowns. The new station will be used for broadcasting over the entire Republic; its power will be five kW and the wave-length 500 metres, which it will be possible to increase to 2,000 metres. It is also planned to erect stations, each of 1 kW, in Brno, Bratislava, and Kosice; they will broadcast on a 500-metre wave-length.

Germany.—NEW STATION.—The new Elberfeld broadcasting station has been completed, and tests on a wavelength of 207 metres have been very successful. The station will begin regular programmes probably this week, says *The Times*.

Japan.—NEW STATIONS.—Mr. Y. Niwa, chief engineer of the Nippon Electric Co., which is affiliated with the International Western Electric Co., is in New York studying radio matters, and announces that early next autumn Tokio and Osaka will each have a broadcasting station; the former city has hitherto been served by a temporary station.

Radio Leagues.—RIVAL BODIES.—The "Wireless League," which was formed last March by the efforts of the *Daily Express* and claims to have 81,000 members, but has apparently not yet been legally registered, now has a rival. It is reported that certain "founder" members, claiming that the committee was not appointed in accordance with the proposed constitution of the League, have expressed their dissatisfaction by incorporating the "New Wireless League."

Shanghai.—RADIO EXHIBITION.—What was said to be the first radio exhibition held in China, took place on May 9th and 10th. It was promoted by the International Amateur Radio Association of China and was well attended, says *Commerce Reports*, and the exhibits included all types of receiving sets from crystal to superheterodyne; transmitting sets were also shown, as well as some short-wave receiving equipment. Although the importation of radio sets into China has been officially reported as falling within the arms embargo, radio sets have filtered into the market from various unknown sources. One station in Shanghai broadcasts daily on a wavelength of 356 metres.

Contracts Open and Closed.

(The date given in parentheses at the end of the paragraph indicates the issue of the "Electrical Review" in which the "Official Notice" appeared in our advertisement pages.)

Open.

Australia.—MELBOURNE.—State Electricity Commission. September 21st. 250-kVA, 22,000-V transformers and spares.

September 15th. Postmaster-General's Department. (Sched. C.36). Telegraph equipment. Tender forms from High Commissioner, London.

NEW SOUTH WALES.—New South Wales Railways. October 7th. One 20,000-kW turbo-alternator for White Bay power house.

NEWCASTLE.—September 22nd. Caledonian Collieries, Ltd. Ward-Leonard electric winding engine for Aberdare central colliery, complete with balancer, exciter, and the necessary switchgear.

Dundee.—August 19th. Town Council. Electric lighting for Lawton housing scheme (200 houses) and Stirling Park scheme (20 houses).

Egypt.—CAIRO.—September 9th. Ministry of Education. One 50-h.p. Diesel engine, generator, electric motors and machine tools for the Mansurah Trades School.*

Fleetwood.—August 24th. Urban District Council. Feeder cable and pillar. (See this issue.)

Glasgow.—August 11th. Corporation. Electric light installation for Elder Park Child Welfare Clinic, Govan.

Ilford.—August 18th. Urban District Council. 660-V paper-insulated cable.

India.—India Store Department.—August 11th. 313-kVA, 3-phase alternators and exciters and accumulator cells. (July 24th.)

Kettering.—August 28th. Electricity Works. One cooling tower and tank circulating water pipe. (July 31st.)

London.—August 26th. Metropolitan Asylums Board.—Installation of additional electric lighting at North-Eastern Fever Hospital, Tottenham. (July 31st.)

Acton.—August 28th. Borough Council. Overhead wiring at the Council's Isolation Hospital, Wales Farm Road, Acton. (See this issue.)

Lowestoft.—August 14th. Metropolitan Asylums Board. Overhauling and refitting two electric generating sets (Willans and Robinson) at St. Luke's Hospital, Lowestoft. (See this issue.)

Manchester.—August 12th. Education Committee. Electric lighting installation at Harpurhey High School.

August 18th. Electricity Department. One water-tube boiler, &c. (July 24th.)

August 20th. Electricity Department. Supply and erection of constructional steelwork at Burnage sub-station.

August 11th. Tramways Committee. Supply and delivery of steel girder tramway rails, steel fishplates, steel clip plates, and coach screws. Specifications and forms of tender from Mr. H. Mattinson, general manager, 55, Piccadilly, Manchester.

Newbury.—August 10th. Board of Guardians. Electrical generating plant at the Poor Law Institution. (July 31st.)

Newport (Mon.).—August 15th. Electricity Department. Ferro-concrete foundations for a 10,000-kW turbo-alternator and condensing plant, and one 49/50-ton engine-room crane, &c. (July 24th.)

New Zealand.—Wellington.—September 22nd. Post and Telegraph Department. Bituminous tape.*

September 29th. Public Works Department. 560 galvanised steel transmission line towers, complete with cross-arms, ground stubs, and accessories. (A.X. 2.250.)*

Preesal.—August 17th. Urban District Council. 6,600-V cables, l.p. distribution and service cables, including excavation and reinstatement. (July 24th.)

Salford.—August 12th. Board of Guardians. Electric lighting installation at Old People's Homes, Pendleton. (See this issue.)

South Africa. — Johannesburg.—September 3rd. South African Railways and Harbours. Five 4-wheeled traversers and two tractors.*

October 13th. Electricity Supply Commission of South Africa. Equipment and buildings for an electric power station at Durban:—Complete boiler-house equipment, also other plant and piping; boiler-house installation, including pulverised fuel equipment, with buildings, piping and other plant; steel-frame buildings; overhead electric travelling crane; coal- and ash-handling plant; two 12,000-kW turbo-alternators; condensing plant and auxiliary apparatus; transformers for power station; and switchgear and auxiliary plant. (July 31st.)

Bulawayo.—September 29th. Municipal Council. Plant for the extension of the electricity works.*

Stockport.—September 5th. Board of Guardians. Conversion of lift at Stepping Hill Hospital from hydraulic to electric power. Particulars from the Steward at the hospital.

*Further particulars can be obtained at the Department of Overseas Trade (Inquiry Room), 35, Old Queen Street, S.W.1.

Closed.

Australia.—Victorian Railways. Accepted:—
15-ton electric travelling Goliath crane (£2,005).—Babcock & Wilcox, Ltd.—*Tenders.*

Brighton.—Lighting Committee. Accepted:—
Coal-handling plant at Southwick (£10,530).—Strachan & Henshaw, Ltd.
E.h.p. switchgear and panel (£1,346).—A. Reyrolle & Co., Ltd.
75-h.p., 3-phase motor (£150).—Fuller Electrical & Manufacturing Co.
Two 1,000-kW La Cour converters (£4,114 each).—Bruce Peebles & Co., Ltd.
9-way neutral feeder panel (£226).—Metropolitan-Vickers Electrical Co., Ltd.

Tramways Committee. Accepted:—
100 tons steel-girder track rails (£9 per ton).—Anglo-Belgian Improvements Corporation, Brussels.

Carlisle.—Electricity Committee. Accepted:—
Erection of new electricity works, Willow Holme (£18,238).—Messrs. Durham & Veevers.

Erith.—Urban District Council. Accepted:—
Wiring 14 bungalows at Bedonwell (£63).—Erith Electrical Co., Ltd.

Glasgow.—Electricity Committee. Accepted:—
Erection of sub-station at Bishop's Road (£879).—James Crawford.
Erection of sub-station at Fleurs Avenue (£848).—R. Murdock & Son.

Housing Committee. Accepted:—
Electric lighting installation at Langlands housing scheme (£795).—Robert Mickel.

Halifax.—Tramways and Electricity Committee. Recommended:—
Supply and erection of e.h.p. switchgear at Highroad Well depôt (£8,447 8s.).—British Thomson-Houston Co., Ltd.

Accepted:—
Foundations for four additional cooling towers.—P. Fulcher, New Road (£5,760); J. Berry, New Bank (steelwork).

Hastings.—Electricity Committee. Recommended:—
Selective panel to switchboard (£99).—Messrs. W. T. Glover & Co., Ltd.

Hebden Bridge.—U.D.C. Accepted:—
Installation of electric lighting in houses at Eaves Bottom.—Bell Electrical Co. (Northern), Ltd.

London.—Stepney.—Electricity Supply Committee. Recommended:—
Feeder and sub-feeder boxes (£424).—British Insulated & Helsby Cables, Ltd.

Fulham.—Board of Guardians. Accepted:—
Renewal of 100 cells in the storage battery at the Union.—Hart Accumulator Co., Ltd.

Westminster. — General Purposes Committee. Recommended:—
Modernising electricity installation at Caxton Hall (£205 10s.).—Belshaw and Co., Ltd.

Sowerby Bridge.—West Riding County Council. Accepted:—
Installation of electric light at police station.—Mr. J. Quain.

York.—Education Committee. Accepted:—
Installation of electric lighting at Castlegate School (£276).—H. Mandefield

Electricity Committee. Recommended:—
Erection of sub-station at Wringhouses (£144).—R. Turner & Son.
Boiler foundations at Foss Islands station (£222).—W. Birch & Sons, Ltd.

Notes.

A New Electrically-equipped Dock. — A new dry dock 515 ft. long, has been built at Sunderland for Messrs. T. W Greenwell & Co., Ltd. The machinery throughout is elec trically driven from the Sunderland Corporation supply. Th bulk of the installation has been provided by the Sunderlan Forge & Engineering Co., Ltd. The sub-station containing th high-pressure switchgear, &c., also accommodates an air-com pressing plant, with a maximum capacity of 1,650 cu. ft. pe min. at 100 lb. pressure. A d.c. 100-V motor-generator set i installed in the pump-house supplying lighting for the doc and ships in dock, and also a portable electric-welding plant A new electric travelling crane, built by Messrs. Samuel Butle and Co., Ltd., has been installed on the north-west side of th dock, and embodies the most modern ideas; it is capable o lifting a load of 50 tons at a 40-ft. radius, or 25 tons at th centre of the dock, the maximum radius being 120 ft.

N.A.S.E. Scholarship Scheme. — The third annual com petition in connection with the W. E. Highfield scholarshi closes on Monday next, August 10th, at 12 noon, by whic time all papers submitted by candidates must be in the hand of the secretary at 43, Russell Square, London, W.C.1.

London Electrical Engineers.—27th A.A. Battalion R.E (T.A.). Honorary Colonel, Colonel R. E. B. Crompton, C.B Officer Commanding, Lieut.-Col. C. H. S. Evans, O.B.E A.M.I.E.E. The following orders have been issued fo August:—

304th Company (Major W. H. Merrett, T.D., A.M.I.E.E.).—Mondays, 7 p.m. to 9.30 p.m. Overhaul and packing of plan for annual camp. The Company proceeds to annual camp o Sunday, August 16th, and will man five detached lights.

305th Company (Major A. W. M. Mawby, O.B.E A.M.I.E.E.).—Tuesdays, 7 p.m. till 9.30 p.m. The Compan proceeds to annual camp on Sunday, August 30th, and will ma five detached lights.

306th Company (Major F. C. Clarke, A.M.I.E.E.).—Friday 7 p.m. to 9.30 p.m. The Company proceeds to annual cam on Sunday, August 30th, and will man five detached lights.

Final musketry practice at Rainham Ranges at 12.30 p.m August 9th. All vehicles and plant will be entrained on Augu 13th. Twelve searchlights at the British Empire Exhibitio will be manned by 305th Company and 306th Company fro August 16th to August 30th, and by 304th Company fro August 30th to September 13th.

The annual camp will be held from August 16th to Septem ber 13th at Watchet (near Minehead, Somerset). Headqua ters at 46, Regency Street, S.W.1, will continue to be open t 8 p.m. on weekdays, and 1 p.m. on Saturdays.

The Officers' Mess during camp will be at A.A. Camp, Dor ford, Watchet, Somerset.

Belt and Rope Driving.—Errata to article, p. 169, Ju 31st, 1925:—

In (2) $T/t = e^{\mu\phi}$ should be $T/t = e^{\mu\phi}$; 2nd column, 3 line below illustration, $2R = 2.926\ (2 - \phi)$ should be $2R = 2.9$ $(T - t)$.

In (14) P = total 42,700 n × horse power/v should be P = 42,700 n × horse power/v.

In (18) the denominator $R \times n$ should be $R \times N$.

Electricity Commissioners' Advisory Committee on Domestic Supplies.—We have been informed that the constitution of the Advisory Committee on Domestic Supplies and Methods of Charging appointed by the Electricity Commissioners, which we announced in our issue of April 17th last, includes two representatives of the Conference of Officials of the London Electric Supply Companies. The names of these gentlemen, Mr. W. A. Pearman and Major H. Richardson, should have appeared in the announcement as representing their organisation on the committee.

Fatality.—An explosion resulting in the death of one electrician and serious injuries to another, occurred on July 8th at the Clyde Navigation Trust electric power station, Govan Graving Dock, Glasgow. Deceased, Alex. Marshall (22), Shettleston, was ascertaining the pressure generated by the main air compressor motor. There was an explosion and the cover of the air compressor motor was blown through the glass roof of the building and struck a man working in another part of the pressure house. Considerable damage was done to the building.

Educational.—West Ham Municipal College.—Day and evening courses in civil, mechanical, and electrical engineering have been arranged at the College. Particulars from the Principal of the College. (See our advertisement pages to-day.)

Ship-Shore Telephone Communication. — The cable ship *Faraday*, owned by Messrs. Siemens Brothers & Co., Ltd., of Woolwich, recently returned after a voyage to South America during which she carried out the laying of a submarine telegraph cable for an Italian cable company between the island

Siemens Portable Receiver in Brazil.

Fernando Noronha (off Brazil) and Rio de Janeiro. It is of interest to note that during the operation communication between the vessel and the island was maintained both ways by means of radio telephony with the aid of the receiving apparatus shown in the accompanying illustration. The set is the standard Siemens portable type-M.I.P. receiver.

Irish Free State Electricity Bill.—The Electricity Supply (Special Powers) Bill, 1925, which has been read a second time in the Saorstat Eireann appears to be of a sweeping character, and it seems to place the whole of the electricity supply industry at the disposal of the Minister of Industry and Commerce. The Bill has been drawn up to allow all electricity generating undertakings to render mutual assistance and enable them to meet the normal demand until power becomes available from the State River Shannon hydro-electric scheme. Its object is to save the expenditure of money on new plant, which might be rendered useless four or five years hence by the State scheme referred to. Such additional plant might in Dublin alone involve an expenditure of £40,000 or £50,000. When an agreement is entered into in pursuance of a requirement of the Minister he is to settle its terms, and voluntary agreements are to be subject to his approval. Local authorities may borrow money under the Electricity (Supply) Acts, 1882 to 1919. for the purpose of carrying out such agreements, and the Bill is to supersede all existing provisional orders and Acts of Parliament. The Committee stage of the Bill has been fixed for November 3rd, 1925.

Aluminium Alloys.—From a paper read recently before the American Society of Mechanical Engineers by Messrs. R. Greeter and P. Faragher, dealing with the properties of alloys of aluminium, *Machinery* give some interesting notes. It is pointed out that by the addition of relatively small amounts of other elements to commercially pure aluminium, it is possible to produce alloys which possess very satisfactory mechanical properties and good foundry characteristics, and at the same time retain in a large measure the desirable properties of the commercially pure metal. The most commonly-used alloying elements or "hardeners" are copper, silicon, zinc and manganese, and to a lesser degree nickel and magnesium.

In comparing the accuracy with which aluminium alloy products can be produced, the following comparison is of interest. For die castings tolerances are discussed in thousandths of an inch, for permanent-mould castings in thirty-seconds and sixty-fourths, while for sand castings tolerances are considered in eighths and sixteenths. In a table showing the mechanical properties of some of the more commonly used alloys the following figures are of interest. With a composition consisting of 10 per cent. copper, 1.2 per cent. iron and 0.25 per cent. magnesium, the maximum tensile strength in lb. per sq. in. is given as 30,000; the maximum elongation per cent. in 2 in. as 1.5; and the Brinell hardness number as 85-105. With 10 per cent. silicon the maximum tensile strength is 29,500; 5.5 silicon and 4.5 copper, 29,500; 10 copper, 29,000; 5.5 copper, 1.0 iron and 1.0 tin, 26,500.

Russian Railway Electrification.—According to the *Railway Gazette* it was decided at a recent meeting of the Gosplan (State Planning Commission) to begin work on the electrification of the Moscow suburban railways, and the Commissariat of Ways and Communications was requested to proceed at once with the preparation of a plan so that the work could be started in October. An expert is to be sent abroad to study questions connected with the electrification of railways.

Radio Engineers and the I.E.E.—Qualifications for Membership.—The Institution of Electrical Engineers has issued the following statement:—Recent correspondence in the Press indicates that there is some misconception as to the eligibility of wireless engineers for membership of the Institution, and it is therefore necessary to state that it is possible for an engineer to become a member with qualifications of a purely wireless nature. For the admission of wireless engineers to the class of associate member (A.M.I.E.E.) it is necessary, in addition to the possession of adequate professional experience for a period of at least two years, in the case of those who do not possess an exempting examination qualification, or do not submit a satisfactory thesis, to pass the A.M.I.E.E. examination in the following subjects:—(1) English essay, or translation from a foreign language; (2) applied mechanics; (3) heat, light, and sound, or inorganic chemistry; (4) electricity and magnetism; and (5) wireless and high-frequency engineering.

The Committee of the Wireless Section of the Institution has recently considered the above syllabus, and is of opinion that it represents the minimum amount of professional knowledge which a qualified wireless engineer should possess. No conditions are laid down by the Institution as to how or where an applicant may have obtained his training. For others who are unable to pass the examination, there is provided the class of Graduates, but it must be pointed out that admission to this class does not confer any professional standing, the requirements being a good education and employment in an engineering or scientific capacity in the applications of electricity. In order to become a member of the Wireless Section it is necessary that the member of the Institution shall be actively engaged in the study, design, manufacture, or operation of wireless or high-frequency engineering apparatus. The meetings of the Wireless Section are not, however, confined to members of the Section, but are open to all members of the Institution.

It has also been stated that the Committee of the Wireless Section consists nearly always of the same body of men. This is not the case, as the rules of the Section provide for the retirement of one-third of the ordinary members of the committee each year. Some valuable suggestions have emerged from the recent correspondence, and will receive the careful consideration of the Wireless Section Committee, more particularly as regards the type and number of papers read and as to increasing the activities of the Section outside London. As regards the suggested formation of a new society, the Wireless Section Committee considers there is no need for it, because, as indicated above, wireless engineers can obtain membership of the I.E.E., and amateurs are already catered for by the Radio Society of Great Britain.

New Leeds Generating Station. — The Electricity Committee brought before the City Council, on July 29th, a proposal that application be made to the Electricity Commissioners for power to borrow £865,000 for the first portion of a proposed new generating station for the city. The City Council approved of the recommendation without discussion and Mr. N. Hefford, city electrical engineer, and representatives of the Committee will interview the Commissioners. Mr. Hugh Lupton, chairman of the Electricity Committee, has stated that the demand in Leeds is growing so quickly that it is obvious that in a few years the big station at Whitehall Road will be inadequate, and therefore steps must be taken to secure additional supply. He did not state where the proposed new station might be, but said it would not be at Whitehall Road. In 1912 there was a proposal in Leeds to establish a very large station on a special site and expert advice was taken. It was decided, however, that for the time being and for a number of years the need could be met by extensions and alterations at the Whitehall Road works which have enabled that works to carry on up to the present time, when the output is about five times as much as in 1912. Possibilities of further extensions at Whitehall Road are now exhausted. Asked for further details, Mr. Lupton said: "Until the project has been discussed and decided by the Commissioners, there is nothing more to be said about the scheme."

Long-Burning Flame Arc. — Some particulars are given in the *Illuminating Engineer* of a new German enclosed flame arc lamp which is claimed to work for 125 hours without recarboning, and even 140 hours' burning has been obtained in some recent tests. The consumption of the lamp is approximately 0.25 W per c.p. (mean spherical), and it operates at from 7.5 to 10 A. Carbons can be furnished to give white, yellow or red-orange light, the last being preferred in cities where fogs are frequent. Exhaustive tests of these lamps have recently been carried out, and several have been erected for comparative tests with 1,000-W gas-filled incandescent lamps.

Accident.—By accidentally touching a cable, an electrician is reported to have been seriously burned in a street manhole in Glasgow on August 3rd.

A H.p. Phase Testing Device.—The accompanying illustration, fig. 1, is of a device, described in *Power*, designed for phasing out feeders, transformers, &c., on a 6,600-V system. The apparatus consists of two metal points, each connected to one of the inner coatings of two Leyden jars. The outer coatings of the jars are connected by means of flexible leads to the terminals of a neon lamp. The Leyden jars are mounted

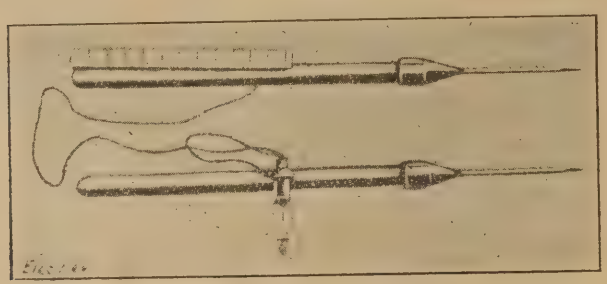


Fig. 1.

in handles of dry, well-seasoned and varnished beechwood. The top parts, which carry the metal points, are made of bakelite. The jars are made of glass tube, ⅝-in. in diameter and 5½ in. long, with a 1/16-in. wall closed at one end. The outer coatings are of brass tubing and the inner of tinfoil. The

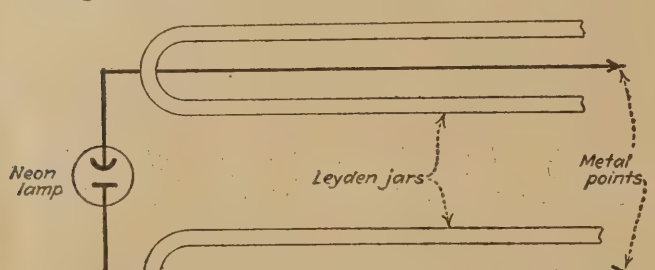

Fig. 2.

lamp is mounted on one of the handles. In operation the metal points are brought into contact with the conductors under test, and if a pressure difference exists between them, the lamp glows, and the operator is subjected to a minimum of risk. The device gave indications up to 20,000 V on test. A sketch diagram of the connections is shown in fig. 2.

Appointments Vacant.—Instructor in electrical engineering (two evenings per week), for Technical Institute, Kingston-on-Thames; two charge engineers, chief draughtsman, and switch control room attendant, for Wolverhampton Corporation. (See our advertisement pages to-day.)

Women Want Electricity.—The Plymouth Corporation has received a request from the local Co-operative Women's Guild that it shall insist upon all new houses being electrically wired for both cooking and lighting purposes.

Institution Notes.

Institution of Electrical Engineers.—Chartered Electrical Engineers in the Irish Free State.—Under the by-laws of the Institution of Electrical Engineers, its corporate members are designated "Chartered Electrical Engineers," and the care exercised by the Institution in admitting to corporate membership has conferred a definite professional status of a high order upon such members. It is satisfactory to know that the Irish Free State Government recognises this, and that the corporate members of the Institution practising in the Free State are regarded by it as possessing full professional qualifications.

In view of the altered conditions in 1925, the Council of the Institution specially authorised the Committee of the Irish Centre, which meets in Dublin, to advise the Irish Free State Government on matters concerning electrical engineering, if such advice is desired, and although no official steps have as yet been taken, the relations between the Free State Ministry of Industry and Commerce and the Irish Centre have been entirely satisfactory. Informal assistance has been given whenever asked for, and there is little doubt that in any legislation which may be effected in the future the position of chartered electrical engineers in the Irish Free State will be fully safeguarded.

Iron and Steel Institute.—Among the 18 papers to be read at the Autumn Meeting of the Iron and Steel Institute, which will be held at the University, Edmund Street, Birmingham, from September 9th to 11th, are "High-Frequency Induction Furnaces," by Mr. D. F. Campbell, and "The Magnetic and Electrical Properties of Cast Iron," by Mr. J. H. Partridge.

Our Personal Column.

(Electrical men are invited to enable us to keep readers of the "Electrical Review" posted concerning their movements).

Luton Corporation has increased the salary of its electrical engineer from £1,000 to £1,200 per annum.

The Brighton Corporation Lighting Committee recommends the following increases of salary:—Mr. Christie, chief electrical engineer, from £1,450 to £1,650 per annum; Mr. G. Claughton, assistant engineer, from £750 to £850; and Mr. G. T. Joyce, assistant manager, from £600 to £700 per annum.

At a meeting of the Engineering Advisory Committee of the South-East Lancashire Electricity Advisory Board on July 28th, Mr. W. J. H. Wood, the borough electrical engineer of Bolton, was appointed chairman in succession to Mr. S. L. Pearce, and Mr. S. J. Watson, of Salford, was appointed vice-chairman. Mr. Pearce's successor at Manchester, Mr. H. C. Lamb, was welcomed by Mr. Wood upon joining the Committee.

The Lancaster Town Council has decided to increase the salary of Major G. C. Milnes, borough electrical engineer, from £600 to £680 per annum.

The impending departure of the manager of the Walsall Corporation tramways (Mr. C. Burgess) to take up an important post in the East was the subject of a special reference at a meeting of the Town Council recently, when a resolution was unanimously adopted expressing regret at his resignation and high appreciation of his services. The Midland Association of Municipal Tramways has presented to Mr. Burgess a gold watch and to Mrs. Burgess a silver tray.

The Preston Town Council has appointed Mr. J. A. Robertson, consulting engineer for four years from January 1st, 1925, at a salary of £400 per annum, in connection with the new electricity undertaking. His services are to be retained in connection with the installation of the third turbo-generator at Ribble power station and of the Blackburn and Preston joint cable.

The Ilford Urban Council has decided to consolidate salaries of officials as under as from April 1st last:—Mr. A. H. Shaw electrical engineer, £997 10s., based upon the scale fixed by the I.M.E.A., but supply to the tramway undertaking to be calculated upon basis of 50 per cent.; Mr. L. E. Harvey, tramway manager, £835; Mr. H. H. Simpson, works superintendent, £330, rising by £10 a year to a maximum of £350; Mr J. C. Richards, traffic superintendent, £310, rising by £10 a year to maximum of £350.

Mr. Fredk. J. Collis has been appointed secretary to the Electrical Accessories Manufacturers' Association, and communications may be addressed to him on behalf of the Association at the offices, 39, St. James's Street, London, S.W.1.

The English Electric Co., Ltd., announces that, during the absence on leave of Mr. P. J. Pybus, Mr. Victor Watlington will act as managing director of the company.

Mr. C. H. Goodwin has been appointed assistant electrical engineer to the Bangor Corporation. He was formerly works superintendent.

The International General Electric Company announces that Mr. Clark H. Minor, former vice-president of the company has been elected president to succeed Mr. Anson W. Burchard who has been both president and chairman of the board. Mr Burchard will continue as chairman. Mr. Minor recently returned from Europe, and Mr. Burchard left to proceed there. Mr. Loren Emery, former assistant merchandising manager of the company, has been made general merchandising manager. Mr. R. G. Henderson, who has been in Europe for the past year and a half conducting important negotiations for the company with particular reference to merchandising lines, has been relieved of the duties of general merchandising manager, and has been assigned to special work in connection with problems of sales promotion.

The Keighley Corporation has fixed the salary of the borough electrical engineer (Mr. H. Webber) as from April last at a minimum of £800 per annum, with an allowance of £20 for every complete 1,000,000 kWh sold above 10,000,000 kWh in each financial year, and as from April 1st, 1926, £30 for every reduction of .03d. in the works cost in each financial year below the figure for the year ending March 31st, 1926.

Mr. John H. Parker, deputy electrical engineer to the Croydon Council, has been appointed borough electrical engineer at West Hartlepool, at a salary of £1,015 per annum. There were 88 applicants for the position. Mr. Parker was educated at Bath and Weston-super-Mare, and served his apprenticeship with Messrs. Alley & McLellan, of Glasgow. While an evening student at Glasgow Technical College he won the Malcolm Ker bursary for Natural Philosophy tenable for three years

at the day classes, and took the electrical engineering course. On the recommendation of Dr. Magnus Maclean, Professor of Electrical Engineering, he was given a junior position on the staff of the Greenock electricity department, and in four years rose to be works superintendent of the new power station, which had a refuse destructor attached as an adjunct to the main boiler house. Three years later he was given the position of staff engineer and was later appointed chief assistant engineer. In 1915 he went to Croydon as deputy electrical engineer, and during the last five years has been engaged principally on the complete reconstruction and extension of the power station of that undertaking, involving a change of periodicity and the application of 3-phase generation to an existing single-phase network. Mr. Parker has been closely identified with the recent movement for improving the qualifications, status and conditions of employment of supply engineers. He was one of the original members of the Chief Technical Assistants' Association of London, which was formed in 1915, and was one of the two delegates sent by that body to negotiate an amalgamation with the newly-formed E.P.E.A. At the first National Executive Council of the E.P.E.A. Mr. Parker was elected a vice-president, and he was closely identified with all the negotiations in 1919, resulting in the Stoker award of 20 per cent. plus £90 and the formation of the National Joint Board. In 1920 he succeeded Mr. Lunn and became the second president of the E.P.E.A. During his year of office the Stoker award was increased from 20 per cent. and

Mr. John H. Parker,
who has been appointed Borough Electrical Engineer at West Hartlepool.

£90 to 20 per cent. and £120, and he captained the group of four which negotiated the salary schedule and conditions of employment and was largely responsible for the tactics which led to that award being adopted by the large majority of undertakings throughout the country. When the salary schedule was revised in 1922, he was again a member of the negotiating committee.

Obituary.—Many of our readers will desire to join with us in expressing deep sympathy with Sir Charles and Lady Bright on the death of their only son, Mr. Geoffrey C. C. Bright, who passed away on July 30th, aged 23, at a nursing home, after a long illness.

Sr. A. Pereira.—The death recently occurred in Lisbon, at the age of 72 years, of Sr. Alfred Pereira, a former Director-General of the Portuguese Post and Telegraphs. The deceased, who started life as a postman, presided over the International Telegraph Conference in Lisbon in 1915.

Prof. Otto Lummer.—The death recently occurred of Prof. Dr. Ing. Otto Lummer, for many years director of the Physical Institute of the University of Breslau.

Mr. H. L. Williams.—We regret to record the death which occurred on July 25th, at the age of 52 years, of Mr. Hugh Lawrence Williams. A correspondent of *The Times* states that after Mr. Williams left Charterhouse and Trinity College, Cambridge, he qualified as an electrical engineer. "He was one of the principals in the firm of Balfour, Beatty and Co., Ltd., since its inception in 1909, and, indeed, had been associated with Mr. George Balfour, M.P., the head of that firm, for some ten years before. He was thus closely concerned in the electric supply and other public utility enterprises with which his firm was identified, and, particularly on the technical side, did much to assist in their successful development."

New Companies Registered.

Cleartron Radio, Ltd. (207,568).—Registered as a public company on July 29th, with a nominal capital of £55,000 in 50,000 8 per cent. cumulative preference shares of £1 and 100,000 deferred shares of 1s. The residue of the distributed profits remaining after paying the dividend on the preference shares is to be divided amongst the deferred shareholders. In a winding up the assets available for distribution are to be applied in repaying capital on the preference shares, and any residue remaining divided amongst the deferred shareholders. Objects: To acquire the registered trade marks "Cleartron" and "C.T.," and to adopt an agreement with A. H. Carlisle and to carry on the business of manufacturers of wireless instruments and parts, electrical fittings, loud speakers, valves, telephones, accumulators, batteries, glassware and kindred articles, &c. Minimum cash subscription, £7. The directors are:—A. H. Carlisle, Trafalgar Buildings, 1, Charing Cross, S.W., merchant banker (managing director); T. F. Grundy, Copthall House, Copthall Avenue, E.C., incorporated accountant. Qualification (other than first directors appointed by the subscribers), 500 shares. Remuneration, £150 each per annum (chairman, £250), free of income tax. Solicitors: De la Chapelle and Co., 34/6, Gresham Street, E.C.2. Registered office: Trafalgar Buildings, 1, Charing Cross, S.W.1.

Kathoxyd, Ltd. (207,560).—Private company. Registered July 28th. Capital, £1,000 in £1 shares. Objects: To acquire the business carried on at 41, High Holborn, W.C.1, by W. Wolsey, as Kathoxyd, together with the exclusive rights to use the name "Kathoxyd," and to carry on the business of manufacturers of and dealers in chemical compounds, metals and mineral ores, and other substances used as crystal detectors for wireless receiving sets, in particular the crystal known by the above name, manufacturers of and dealers in wireless sets and accessories, &c. The permanent directors are:—W. Wolsey, 29, Gloucester Road, Finsbury Park, N.4 (director, Sylvex, Ltd.); A. Zeitlin, B.Sc., A.S.C., 144, Theobalds Road, W.C., chemist. Qualification, 1 share. Registered office: 41, High Holborn, W.C.1.

Swan Radio Co., Ltd. (207,562).—Private company. Registered July 28th. Capital, £200 in £1 shares. Objects: To carry on the business of wholesale and retail manufacturers and repairers of all wireless apparatus and accessories, &c. The first directors are:—J. F. Dolan, 41, Orchard Road, Sutton; C. B. Kersting, 1, Elmworth Grove, West Dulwich. Secretary: J. F. Dolan. Registered office: 18, Kingsland Road, Shoreditch, E.

Finston Manufacturing Co., Ltd. (207,423). — Private company. Registered July 22nd. Capital, £10,000 in £1 shares (6,000 cumulative preference shares and 4,000 ordinary). Objects: To carry on the business of manufacturers of and dealers in electrical batteries, lamps and torches, hand, cycle and other lamps, electrical instruments, and novelties, films, brackets, globes, filaments, shades, glasses, &c. The managing directors are:—G. F. A. Stone, 22, Hooking Green, Pinner, manufacturer; P. R. Shackel, 32, Rodway Road, Roehampton, S.W., manufacturer. Qualification, £100. Remuneration, £50 each per annum. Solicitors: Turner & Co., 89, Chancery Lane, W.C. Registered office: 45, Horseferry Road, Westminster, S.W.

Thomas & Stinchcomb, Ltd. (207,541).—Private company. Registered July 27th. Capital, £2,000 in £1 shares. Objects: To acquire the business of an electrical engineer now carried on by E. A. Stinchcomb at 6, Narrow Wine Street, Bristol, as "Thomas & Stinchcomb." The permanent directors are:—E. A. Stinchcomb, A.M.I.E.E., Camden House, St. Michael's Hill, Bristol, chartered electrical engineer; P. J. Strong, 46, Northville Road, Felton, Bristol, salesman. Qualification, £1. Registered office: 6, Narrow Wine Street, Bristol.

Liskeard Gas and Electricity Co., Ltd. (207,549).—Registered July 27th. Capital, £8,000 in £1 shares. Objects: To adopt an agreement with F. T. Depree, S. Simpson, C. J. Ennor, W. H. Huddy, J. Sweet and A. E. Knight, to manufacture, sell and supply light, heat and power in the borough of Liskeard and vicinity, &c. Minimum cash subscription, 7 shares. The first directors are:—F. T. Dépree, "Newlands," Exeter, gas engineer; S. Simpson, "Meresyke," Exmouth, engineer; C. J. Ennor, "Hollywood," Liskeard, statutory civil engineer; W. H. Huddy, Dean Terrace, Liskeard, retired jeweller; J. Sweet, "St. Malo," Liskeard, granite merchant; A. E. Knight, The Parade, Liskeard, bank manager. Qualification, £1. Remuneration (except managing directors) as fixed by the company. Secretary: J. C. Isaac. Registered office: The offices of J. C. and C. Isaac, Pondbridge, Liskeard, Cornwall.

Flinders (Wholesale), Ltd. (207,521).—Private company. Registered July 25th. Capital, £7,000 in £1 shares (4,000 ordinary and 3,000 convertible 8 per cent. preference). Objects: To acquire the wholesale portion of the business of Flinders, Ltd., now carried on at 121, High Street, Colchester, and to carry on the business of wholesale dealers only in the apparatus connected with wireless telegraphy and telephony, and accessories, &c. The directors are:—A. F. Hitchcock (chairman and managing director), 121, High Street, Colchester (managing director of Flinders, Ltd.); G. C. F. H. Vernon (general manager), Grove Hall, Retford, Notts (both permanent subject to each holding £500 shares). Remuneration, £500 each per annum. Secretary: Miss Winnie Blomfield. Solicitors: P. A. Moodie, Excel House, Princes Court, Whitcomb Street, Pall Mall, W.C. Registered office: 18, Butt Road, Colchester.

Coventry Magneto Co., Ltd. (207,481).—Private company. Registered July 24th. Capital, £100 in £1 shares. Objects: To acquire the business of manufacturers of magnetos and magneto parts carried on by W. C. Couch and C. F. H. Foster at Foleshill, and at Grey Friars Lane, both in Coventry, and certain of the assets. The first directors are:—W. S. Couch, Fedalma, Solihull, Warwickshire, merchant; C. F. H. Foster, 24, Beaconsfield Road, Stoke, Warwickshire, engineer. Remuneration as fixed by the company. Solicitors: Rowlands & Co., 41, Temple Row, Birmingham. Registered office: Grey Friars Lane, Coventry.

Official Returns of Electrical Companies.

International Wireless Manufacturers, Ltd.—H. Smith, A.L.A.A., F.I.S.A., of 4, York Buildings, Adelphi, W.C.2, was appointed receiver and manager on July 17th, 1925, under powers contained in debentures created December 2nd, 1924.

G.W.I. Valves, Ltd. — L. A. Bartlett, of 639, Salisbury House, E.C.2, was appointed receiver and manager on July 16th, 1925, under powers contained in debenture dated December 2nd, 1924.

Midget Lamp Company (1924), Ltd.—Particulars filed of £500 debentures authorised July 10th, 1925, charged on the company's undertaking and property, present and future, including uncalled capital, the whole amount being now issued.

Warnolite, Ltd. — Issue on June 30th of £110, and on July 7th, 1925, of £30 debentures, parts of a series already registered.

Wainwright Manufacturing Co., Ltd.—Issue on July 20th 1925, of £1,000 debentures, part of a series already registered.

Shenton & Co., Ltd. — Particulars filed of £4,000 first mortgage debentures authorised July 16th, 1925, charged on the company's undertaking and property, present and future, including uncalled capital (if any), the amount of the present issue being £3,500.

F. J. Jones & Sons, Ltd. — Charge on the company's undertaking and property, present and future, dated July 20th, 1925, to secure all moneys for which the mortgagees may become liable by virtue of a guarantee given to the company's bankers to the extent of £1,000. Holders: Mrs. V. B. Harvey, Deganwy, Church Hill, Aldershot; and W. Ridley, Maesmaur, Llangollen.

J. Churley Cann, Ltd.—Particulars filed of £900 debentures authorised July 23rd, 1925, charged on the company's property, present and future, including uncalled capital, the whole amount being now issued.

W. H. Franklin (Cardiff), Ltd.—E. C. Phillips, of Princes' Chambers, 4, Working Street, Cardiff, was appointed receiver on July 16th under powers contained in debenture dated March 23rd, 1925.

W. S. Laycock, Ltd. — Charge dated May 5th, 1925, to secure £106,153 19s. 2d., charged on the company's undertaking and property, present and future, except uncalled capital, ranking after the charge created by deed poll of even date in favour of Bentinck Coathupe as receiver or manager, but priority to trust deed dated June 27th, 1919, securing debenture stock and interest thereon and all other moneys thereby secured except that any sums hereafter accruing due to the trustees for their remuneration and in respect of costs, charges and expenses incurred by them shall rank as a charge on the property in priority to the charge now created. Holders: Barclays Bank, Ltd. Registered July 19th by permission of the Court.)

H. G. Cooper, Ltd.—Land Registry charge on certain freehold land and buildings in the parish of St. Saviour, London. Holders: E. Edwards and C. E. Edwards, 193, High Street North, East Ham.

Colne Valley Electric Supply Co., Ltd.—Trust deed dated July 4th, 1925, to secure £75,000 debenture stock, charged on the company's undertaking and property, present and future, including uncalled capital. Trustees: Union Commercial Investment Co., Ltd., Dashwood House, 69, Old Broad Street, E.C.2.

Rose Bros. Electrical Co., Ltd.—Issue on July 16th, 1925, of £1,000 debentures, part of a series already registered.

Midget Lamp Co., Ltd. (old company).—L. Jacobs, of 3, 4 and 5, Queen Street, Cheapside, E.C., ceased to act as receiver or manager on July 20th, 1925.

Watford Electric and Manufacturing Co., Ltd.—Satisfaction to the extent of £500 on May 31st, 1925, of mortgage debenture dated May 31st, 1923, securing £3,000, leaving £2,000 unsatisfied.

City Notes.

Reports and Meetings of Electrical Companies; Dividend Results, &c.

Marconi's Wireless Telegraph Co., Ltd.

The annual meeting was held on July 31st, Senatore G. Marconi presiding. In proposing the adoption of the report (*vide* our last issue, p. 189), the chairman, after dealing in detail with the accounts, said that with the issue of 500,000 new shares last February the directors considered that they had sufficient funds to enable them to carry out their present programme of Empire, European, and other foreign services. Last year he referred at some length to the revolutionary changes which were taking place in long-distance communication by the introduction of the beam system, in conjunction with the discoveries which he and the technical staff of the company had made with regard to short waves. Since last August tests and researches carried out under his direction had proved conclusively that still shorter waves were capable of covering world-wide distances as well, and perhaps better, by day than by night, thereby ensuring communication with such distant parts of the Empire as Australia and Canada for the whole of the 24 hours. During recent tests carried out continuously for four days and four nights, communication had been maintained with Australia and Canada. For that reason he felt that they were justified in stating in the report that "there is good reason to anticipate that the company will not only be able to carry out the guarantees of performance which it has given the Home and Dominion Governments, but that these guarantees will be substantially improved upon." Dealing with the objective which the directors had had continually before them for some years past, namely, the creation of a world wireless telegraph system, he said that the original telegraph services opened by the company were necessarily of an experimental nature, but in more recent years each circuit had been added with the knowledge that it would be a complete success from the date of opening. During 1924 they handled 32 per cent. more telegraph traffic than in the previous year. The equal rates quoted by the competing radio and cable routes had not been brought about by the raising of the radio rate, but by a reduction of the cable rate to the wireless level. This equalisation, which took place on their main transatlantic services in the middle of 1923, might have been expected to have caused a considerable diminution in the number of radio telegrams, yet there was an increase of traffic in the service to New York of no less than 22.87 per cent.

The Right Hon. F. G. Kellaway, P.C., managing director, in seconding the motion, said he felt it incumbent upon him to speak with complete frankness as to the position of the company. In the last two balance-sheets the directors had been compelled to allocate a sum of over £3,000,000 from the general reserve account to meet extraordinary losses and to write down various assets. Two years ago the general reserve stood at £3,986,354. In the present accounts that reserve had been reduced to £1,043,120. These were figures which demanded the fullest explanation. Before he could give that explanation he must say something of what had happened during his association with the company. He had now been associated with the company for over two and a-half years, and had held the position of managing director for eight months. About 18 months ago it became clear that under the organisation then existing the directors were not receiving such information with regard to the world-wide interests of the company and its financial commitments as would enable them properly to discharge their responsibility to the shareholders. As soon as he was convinced of that fact, he proposed to the board that a finance committee of directors should be appointed to control the financial and general policy of the company. That committee was formed on June 3rd, 1924, and as soon as it got to work it became obvious that drastic changes in the company's methods were required. They were especially disturbed by the fact that their interests in subsidiary and associated companies were being taken into the accounts at figures which did not represent their real value. They were also disturbed by the growth in the company's expenditure—a growth which had gone on at the same time that shareholders were being asked to accept a lower return on their capital. The finance committee went through every one of the interests in the company's books, and examined them with a full determination to write down the figures to real values. Last year it wrote down to the extent of £2,335,608. This year it had had to make a further writing down to the extent of £677,985. The shareholders would naturally ask if finality had been reached or if they would be faced next year with yet another drastic cut in the company's reserves. He could not prophesy as to the future, but he could assure them that in the general reserves of £1,043,120 which now appeared in the balance-sheet they believed that they had real and substantial values. If conditions abroad improved there should be corresponding appreciation in the reserve; if the course of foreign currencies continued unsatisfactory, still further writing down might be required. The directors realised that their first concern must be to proceed as rapidly as possible to rebuild the reserve, and a step would be taken in that direction this year by placing to the credit of the reserve the premium of 7s. 6d. per share on the 500,000 shares issued in February last. Referring to the future, Mr. Kellaway said he had abundant faith in the future prosperity of the company. His faith was based principally on the intrinsic value of the work of Senatore Marconi and his brilliant assistants. But there were other reasons for confidence. During the past six months they had made a number of agreements with some of the principal electrical and broadcasting companies in this country and abroad for an exchange of patent rights and for the payment of royalties. These should have a favourable influence on the revenue of the company. The progress already made with the beam stations under construction for the Government and in the Dominions and India was satisfactory, and the whole of those services should be working before the end of next year. The Canadian and South African services should be in operation before the end of this year. The revenue from the Dominion end of these services and the royalty which the Government would pay to them on the receipts from the home stations would constitute entirely new sources of revenue. They had taken in hand the reorganisation of certain subsidiary companies which in the past had lost money. Referring to the arbitration by Lord Buckmaster on their claims against the Government, he said that the preliminary stages were proceeding as rapidly as the nature of the work would permit. He could not anticipate the date when Lord Buckmaster would be in a position to make an award, or the amount of the award, but every step would be taken properly to present the case of the company to the arbitrator so as to ensure that the company received just and adequate compensation for the use made by the fighting forces of the company's patents both before and during the war. In conclusion, Mr. Kellaway referred to the beam system, and paid a tribute to the genius of Senatore Marconi. The report and accounts were adopted.

Yorkshire Electric Power Co., Ltd.

The report for the half-year ended June 30th last states that the progress of the company and the rate of new connections have been maintained in spite of the unsatisfactory trade conditions in Yorkshire and the directors feel justified in declaring interim dividends at the rate of 6 per cent. per annum on the preference and ordinary shares as in 1924. Referring to the failure of negotiations with regard to the West Riding (Aire and Calder) Electricity District scheme, the directors state that they consider it impossible to hold up any longer the development of the area covered by the original powers conferred upon the company. They have therefore decided to proceed at once to make a supply available throughout the whole of the area covered by the existing powers of the company. The construction of the new station at Ferrybridge is proceeding and the first generating set will shortly be delivered for erection. Mr. E. R. Benson has been appointed to the board.

French Companies.

The *Compagnie de Signaux et d'Entreprises Electriques*, of Paris, reports net profits of 2,500,000 fr. for 1924-25, and a dividend at the rate of 15 per cent.

The *Société l'Equipement Electrique*, of Puteaux (Seine and Paris, reports a gross turnover of 6,293,000 fr. in 1924, against 4,874,000 fr. in the previous year. As a result of a fire at a depôt last year, the net profit only amounted to 53,000 fr.; this has been carried forward.

Electrical Distribution of Yorkshire, Ltd.

In announcing an interim dividend at the rate of 7 per ent. per annum, the report for the half-year to June 30th states that during that period there has been a large increase in the sale of electricity and considerable developments have taken place in ıe company's areas of supply. The company is making appli-ıtion for a number of new Orders for supply which can be :onomically worked with existing undertakings. To meet the .creased demands the nominal capital is to be increased to 500,000. If this is approved an issue of capital will be made) the shareholders in the coming autumn.

Wellman Smith Owen Engineering Corporation.—The :ofit for 1924, after providing for taxation, was £16,039; the ım brought forward makes available £32,568. An interim ;vidend at the rate of 5 per cent. was paid, but the directors) not recommend a further dividend and propose to carry for-ard £19,918.

Fuller's United Electric Works, Ltd.—The meeting ad-urned from July 27th, at which a resolution creating a prior en debenture for £75,000 in favour of the bank and increasing ıe rate of interest on existing stock, is to be continued on :onday next, August 10th.

City of London Electric Lighting Co., Ltd.—A dividend 1s. per share has been declared on the ordinary shares for ıe half-year to June 30th.

Tokyo Electric Light Co.—*The Times* reports that a New ork syndicate offered during the current week $24 million 3-year 6 per cent. gold notes of this company. The issue ice was 98¾. The company has recovered rapidly from the fects of the earthquake, its revenue now being at a very gh level. It has never paid less than 8 per cent., and since ıe earthquake the dividend has been raised to 10½ per cent.

Enfield Cable Works, Ltd.—The directors' report for the ar ended June 30th last, which is to be submitted at to-day's nual meeting of the company, show a profit of £100,107, to hich is added £14,892 brought forward, making £114,999. irectors' fees, depreciation, and interest require £10,659, aving £104,340. The preference dividend absorbs £65,000, a interim dividend of 5 per cent. on the ordinary shares took 10,103, and it is proposed to pay a final dividend of 15 per nt. on the ordinary shares (making 20 per cent. for the year), quiring £30,308. The reserve receives £14,849 (making it 20,000), and a balance of £34,079 is carried forward.

Para Electric Railways and Lighting Co. Ltd. — The rectors announce that interest of 2½ per cent. is to be paid a the 5 per cent. debenture stock for the six months ended ay 31st last, together with interest at the rate of 7 per nt. per annum for the three months to August 31st next.

Brompton and Kensington Electricity Supply Co., Ltd.— n interim dividend at the rate of 10 per cent. per annum, ee of tax, has been declared on the ordinary shares, and one the rate of 7 per cent., less tax, on the preferred shares. milar dividends were paid last year.

Bristol Tramways and Carriage Co., Ltd.—The directors ve declared an interim dividend at the rate of 3 per cent. ss tax) for the half-year ended June 30th on the ordinary ares.

Chelsea Electricity Supply Co., Ltd.—An interim dividend the rate of 9 per cent. per annum has been declared on the dinary shares.

City of Buenos Ayres Tramways Co. (1904), Ltd.—A divi-nd of 1s. 3d. per share (at the rate of 5 per cent. per annum) s been declared in respect of the three months ended July st.

Westminster Electric Supply Corporation, Ltd.—An in-rim dividend at the rate of 1s. per share has been declared r the half year ended June 30th (as in 1924).

Swan, Hunter & Wigham Richardson.—An interim divi-nd of 3 per cent., free of tax, has been declared on the dinary shares, as last year.

Thomas Bolton & Sons, Ltd.—A final dividend of 2½ per nt. is being paid (making 5 per cent. for the year, as before) d £19,523 is carried forward.

Stocks and Shares.

MONDAY EVENING.

JSTOM, linking arms with the interest which comes from oking back, dictates, at this week in the year, the matching current Stock Exchange prices against those that ruled seven onths earlier. At this particular juncture, markets are suffer-ig from the after-effects of the disturbance produced by the heaval in the coal trade. Bank Holiday made a merciful tervention between worries and work. The Stock Exchange parated, for the three days' holiday, in a subdued frame of ind. August is nearly always a stagnant period in stocks d shares, and even the rubber share optimists admit the strong probability of business remaining languid until the later autumn, as the prophets vaguely forecast.

The influence of the threatened miners' lock-out made itself felt in most Stock Exchange markets, but the electricity supply section suffered singularly little from the effects of the crisis. Present quotations are below the top prices reached since the end of last year, but the passage of the two Electricity Bills, in the spring, sufficed to keep the list firm, notwithstanding the inevitable profit-taking which followed the materialisation of long-protracted eager hope.

How the market has fared, on balance, over the past seven months, this table shows :—

Ordinary Shares.	Dec. 30th, 1924.	Now.	Rise or fall.
Brompton ...	1⅞	1⅞	— ⅛
Charing Cross ...	2⅜	2⅛	+ 1/16
Chelsea ...	37/6	37/6	—
City of London ...	47/6	45/9	— 1/8
County ...	52/6	52/6	—
Kensington ...	10¾	12¾	+2
London ...	33/6	33/-	—6d.
Metropolitan ...	1⅝	38/3	+9d.
St. James' ...	12⅛	13⅜	+ ⅜
South London ...	2¼	2 7/16	+ 3/16
Westminster ...	11	2¼	+ ¼

In the above group, it will be observed, with interest, that the Kensington and St. James's shares are the only surviving members of the £5 denomination. The others are now all of £1 each, and the alteration has done much to render the share market more flexible. The change has taken place without its leading to any noticeable increase in mere speculation. All the fears that used to be entertained on this score have been disproved by what has actually happened.

The outstanding feature amongst cable issues is a rise of £9 in Indo-Europeans. Apart from this, the variations are of no great consequence, as this comparison illustrates :—

Share.	Dec. 30th, 1924.	Now.	Rise or fall.
Anglo-American Pref. ...	104½	102½	—2
Eastern Extension ...	17	17⅛	+ ⅛
Eastern Telegraph ...	172½	172⅝	—
Globe Ord. ...	17⅞	17⅞	+ ⅛
Great Northern ...	29¾	31	+1¼
Indo-European ...	32½	41½	+9
Marconi ...	1⅜	1⅜	— 1/16
United River Plate ...	6 15/16	7⅛	+ 3/16
Western Telegraph ...	17	16¼	— ¾

Marconis have proved a source of disappointment to their supporters. The dividend of 10 per cent. is being maintained, but the reserve fund has had to be reduced. Nothing more has been received from the Government in respect of war claims. When the money which is still owing is finally paid, this will go to fortify the reserve.

Home Railway stocks have experienced a bad time. For not more than a fortnight at a stretch has the market been free from alarms and excursions of one kind and another. Traffics have been poor. The Wembley Exhibition is no extra bull point. With the threatened lock-out of miners, and a general transport strike on top of it, railway stockholders have in many cases decided to put in the knife and to cut their losses. The Underground group published a batch of dividends less encouraging than had been expected. Here are the price comparisons :—

Stock.	Dec. 30th, 1924.	Now.	Fall.
Central London Ord. ...	74	69½	4½
Metropolitan ...	83	69½	13½
District ...	56	45	11
Underground Ord. ...	38	26	12/6
" "A" ...	9/6	7/-	2/6
" Inc. ...	100	98	2/-

News of the "strike settlement," as it was called, came too late to affect prices on the eve of the holiday. There was the customary newspaper talk of record Bank-holiday crowds, &c., although the weather uncertainties may make their force felt in the traffic statistics. Home Rails offer good yields on the basis of the last-paid dividends. Doubt is felt as to whether the rates may not have to be cut; the Metropolitan and the District Railways should, however, find no great difficulty in keeping up their distributions.

The boomlet in rubber shares served to concentrate attention upon the market, and, at the same time, it led to a slight dulness in prices of shares in companies that are large users of the product. Nevertheless, the result of this year's working is favourable in many cases to proprietors of manufacturing shares, as these prices show :—

Share.	Dec. 30th, 1924.	Now.	Rise or fall.
Babcock	2⅜	2 7/16	— 1/16
British Aluminium	29/3	30/9	+1/6
Callender's	2 1/16	2⅛	+ 1/16
General Electric	21/6	24/-	+2/6
Henley's	2 1/16	2 1/16	—
India Rubber	17/6	19/6	+2/-

Johnson & Phillips have risen substantially to 45s., on the idea that the dividend, at present 10 per cent., may be raised by degrees to 15 per cent. Enfield Cable Works have also spurted sharply, to 3 1/16, on publication of an excellent report. General Electrics increased their dividend by 2½ per cent.—from 5 to 7½ per cent.—and Siemens are now paying 7½ per cent. Most of the companies in this group are doing well. Engineering shares reflected, in their falling values, the failure of trade to revive in the "heavy" industries. The boomlet in rubber shares stands out as a feature of the year, having come about by reason of a rise from 1s. 6d. per lb. to 4s. 6d. per lb. in raw rubber. A sharp reaction led to a general setback in rubber share prices.

I.E.E. Wiring Regulations (Buildings).—Considerat of the comments and suggestions made in connection with eighth edition of the I.E.E. Regulations for the Electr Equipment of Buildings issued about a year ago has indica to the Wiring Rules Committee that much of the critic which has arisen has apparently been due to a misun standing of the objects underlying some of the clauses. T will be dealt with in the next revision by amending the wo ing of the clauses in question. A few amendments have, h ever, been considered by the Committee to be of suffici urgency to warrant their immediate publication, and on recommendation of the Committee the Council has decided issue these in the form of an alteration sheet. Other ame ments, not materially affecting principles, are under revi including those arising in connection with the difficulty exp enced in some cases in wiring standard plugs with flexible co and cables of the sizes recommended in the regulations. T matter is still under consideration jointly by the Institut and the B.E.S.A. from the point of view of whether it is p ferable to alter the I.E.E. rating of flexible cords and cab or to amend the dimensions of standard plugs. In connect with the alteration to Condition (xviii) in Regulation Class T1, it has been urged that screwed steel-conduit fitti complying with British Standard Specification No. 31 are necessarily heavy and costly, and the B.E.S.A. has accordin been asked to reconsider this specification. Pending its vision, the Regulations do not require conduit fittings comply with it. Copies of the alterations can be obtained application to the secretary of the Institution, Savoy Pl Victoria Embankment, London, W.C.2.

The First International Congress of Radiology.

Exhibition of X-Ray and Electro-Medical Apparatus.

(*Continued from page* 192.)

n addition to various social functions, arrangements were le for the delegates to visit a number of the London ospitals and the Radiology Division of the National Physical oratory; a selection of radiograms was on view at the ish Institute of Radiology, while X-ray, electro-medical, sical, and other apparatus was exhibited by some 30 ish, American, French, German, and Dutch manufacturing s at the Central Hall, Westminster.

ne of the most important subjects discussed by the Con- s, as indicated last week, was the demand that has arisen higher voltages than can be commercially obtained by the of transformers; this has given fresh impetus to the ch for means of energising X-ray tubes which shall be both ient and capable of precise control. Immersed induction are efficient in so far as the actual excitation of the tube oncerned, but they would scarcely be described as instru- ts of precision; moreover, a coil, as also the ordinary type ansformer, is intermittent in action, the efficiency increas- with frequency of impulse, from which it is evident that tant-pressure apparatus would be more efficient electrically therapeutically, in that dosage could be standardised as rds source and due allowance made for other variable ors. Such a current can be obtained by employing closed- transformers, the impulses from which are fed into con- ers through valves of the electronic or hot-cathode types, condensers being used with each transformer, so that the le cycle of the alternating current is used and maximum sure obtained.

The Gaiffe-Gallot Apparatus.

his has been done experimentally by various workers, Hull he General Electric Co. of Schenectady) having so trans- ed 150 volts a.c. to 0 volts with a fluctua- of approximately 1 per , or even less for lower ges, but it has been o Messrs. Gaiffe-Gallot ilon, of Paris, to place the market the first tant-pressure appara- with an output of 00 volts and sufficient rage to run two s, having a fluctuation ss than 5 per cent. this apparatus Messrs. on & Sons (Electro- cal), Ltd., have ob- d the sole manufac- g rights for Great un and Ireland. Fig. a diagram showing the od employed, with

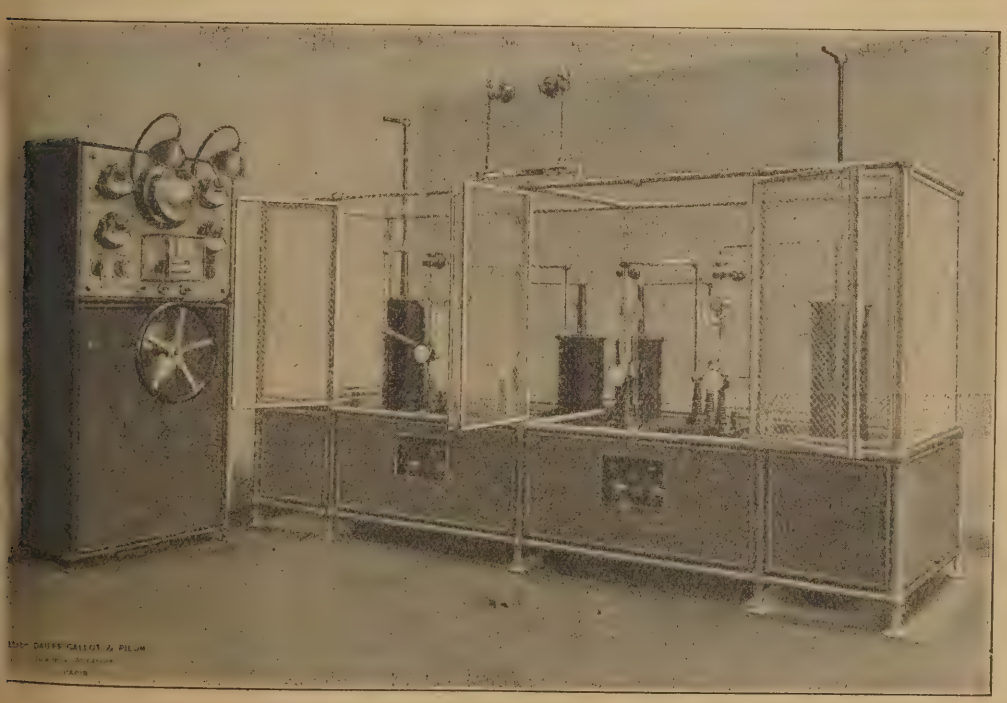

Fig. 3.—General View of Gaiffe Outfit.

transformers in series to attain the output stated , while figs. 2 and 3 are a plan and general view of the apparatus respectively. The two h.p. transformers T (rated at 75,000 volts) are connected in series, each charging two condensers C to 62,000 volts, the margin allowed tending

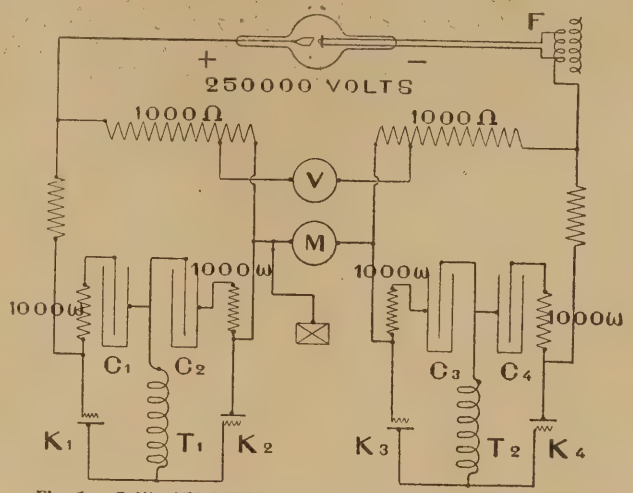

Fig. 1.—Gaiffe 250,000-V Apparatus; Diagram of Connections.

to prolong the duration of each discharge and so augment the constancy of the resulting current; the capacity of the con-

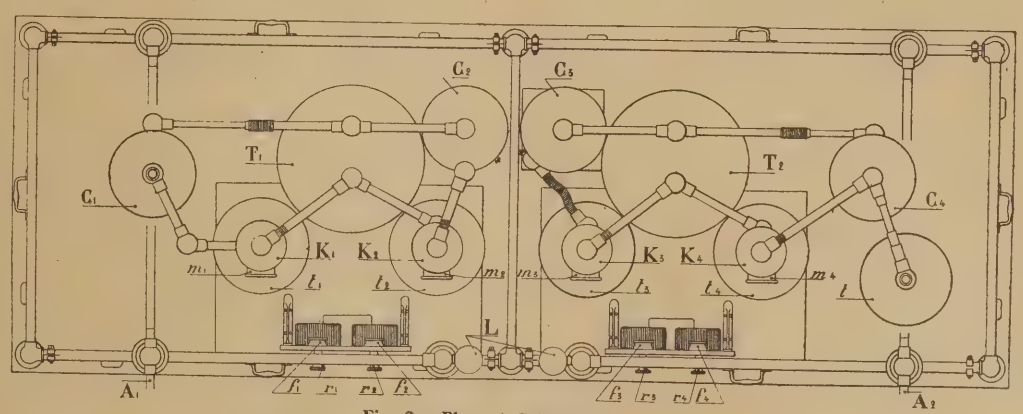

Fig. 2.—Plan of Gaiffe Outfit.

densers is approximately 0.02 microfarad. The four electron valves are designated K, while X is the Coolidge tube and F (*t* in fig. 2) the transformer for heating its filament; M is a milliamperemeter at earth potential, and V a voltmeter reading to 250,000 V in steps of 5,000, the intensity of the current measured being reduced for safety by two resistances of 1,000 megohms each. A_1 A_2 are the h.p. positive and negative terminals respectively; the fuses for the valve transformers are marked *f*, the valve filament voltmeters *m*, their controlling resistances *r*, and the valve filament transformers t_1 t_2 t_3 t_4, and L is a sphere gap.

The installation illustrated is capable of furnishing 10 mA at 250,000 V with a variation of intensity of less than 5 per cent. at full load when fed with 50-cycle a.c. The control cabinet to be seen on the

left of fig. 3 contains a choke coil, which is regulated by the large wheel shown, above which in the square glass case is the milliampere meter used for measuring the intensity of the X-ray emission at any moment and therefore the dosage when calibrated. The generator described above was only one item of Messrs. Watson's large exhibit; for instance, amongst their newest products is a portable X-ray outfit made up into packages for hand carriage. Four packages comprise everything necessary for use on a.c. not exceeding 125 volts, one additional package being necessary for higher alternating voltages, and two when required for use on d.c., and the output reaches 90,000 peak volts, despite which the set can be connected up to an ordinary domestic lighting circuit. The radiator Coolidge tube is specially constructed for this apparatus, differing in size and method of protection from the standard pattern, and the transformer is oil-insulated, with an additional coil wound over one of the h.p. secondaries for heating the cathode filament, and is fitted with a sphere gap.

"Solus" Transformers.

The "Solus" Electrical Co. has adopted oil insulation for all its transformers, irrespective of size, it being of the opinion that wax insulation will not stand the test of time. Each transformer is filled with oil in vacuum so as to exclude air

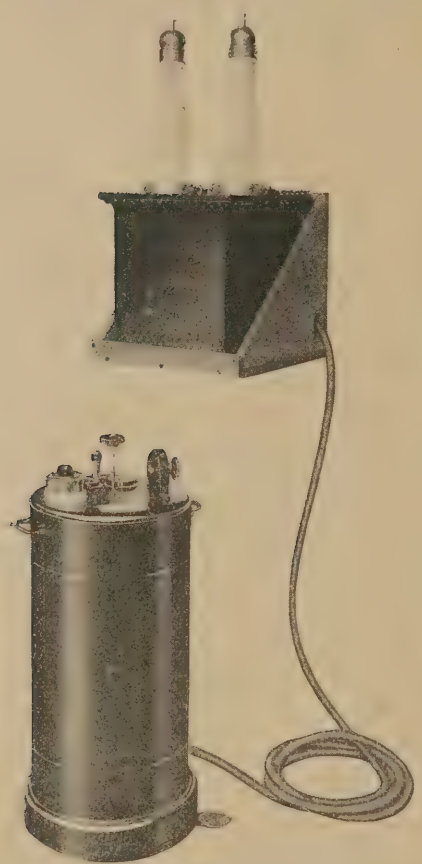

Fig. 4.—"Solus" 30-mA Transformer and Control Gear.

pockets and, moreover, all the company's insulators are oil-filled also. The outfit shown in fig. 4 is specially made for operating a 30-mA, self-rectifying, hot-cathode X-ray tube, and represents simple apparatus for diagnostic work. Owing to the absence of any moving part, it is silent and most compact, while the only floor space required is that taken by the control unit, which is about 15 in. in diameter. The transformer is mounted on a wall bracket, and the filament transformer is fitted in the same tank that houses the h.p. unit. The control table is all metal and carries a foot-operated exposure switch, which can also be used for controlling room light, and a cable is provided for this purpose within the one multiple cab-tire cable. The auto transformer gives as many as 45 settings with only two volts between each, and the means of regulating milliamperage and penetration are quite independent. The company's 10-mA outfit is claimed to be the lightest made; its total weight is no more than 90 lb., of which the transformer accounts for 44 lb.

"General Radiological" Apparatus.

Amongst the various apparatus of the General Radiological and Surgical Apparatus Co., Ltd., much interest was shown in Prof. Holfelder's field selector, which is said to be probably the most accurate means of ascertaining the ports of entry on a patient and, at the same time, of determining the exact dosage for the part to be irradiated.

Of the firm's X-ray apparatus, the "Peo" set shown in fig. 5 is specially constructed for use with Coolidge tubes, and attention may be drawn to its simplicity of manipulation and high output (100 mA at 75 kV).

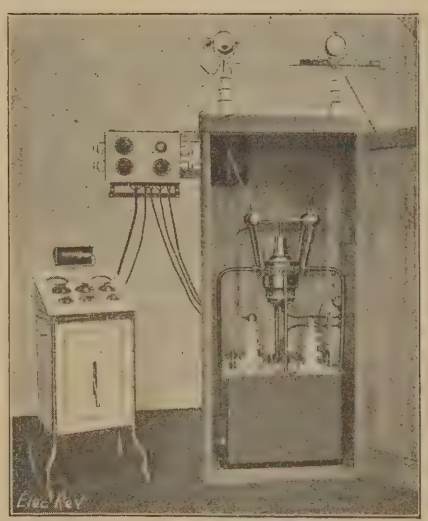

Fig. 5.—"Peo" X-ray Outfit.

For deep therapy the company showed its latest radiati device, namely, Prof. Wintz's tube stand and exposure tab fig. 6; the former is characterised by its extremely ea movement and the excellent protection which is afforded the tube that encloses the Coolidge tube entirely, so th no rays can pass any way except through the compressor the patient. This tube box has been passed by the Natior Physical Laboratory as complying with the requirements the British X-Ray Protection Committee. The exposure tal is of the oil-pump type and allows very fine adjustments any direction, all movements being on ball bearings. T "Polydor" apparatus is the company's most powerful dia nostic set; it is provided with valve-tube rectification, a is also noiseless when working. Various accessories were a on view, such as the plate-changing device for successi

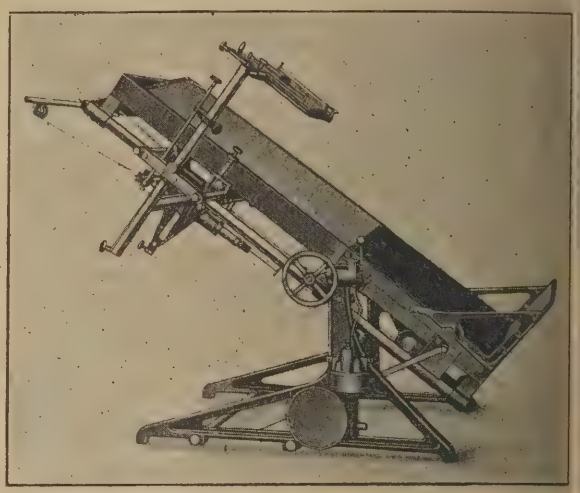

Fig. 7.—A Motor-driven "Clinoscope."

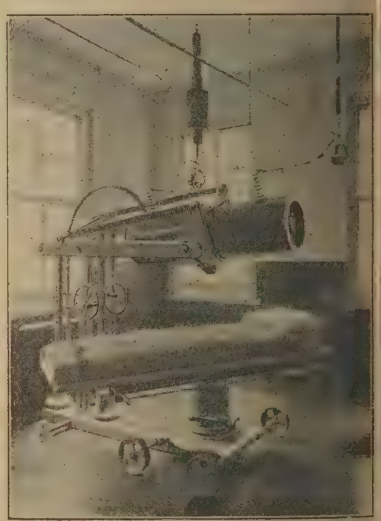

Fig. 6.—The Wintz Irradiating Device.

photographs, metal cassettes, and "Sinegran" intensifyir screens. The "Clinoscope," fig. 7, is an examining apparat with motor-driven movements which can be used as a scree ing stand or couch, and by means of which patients can examined or photographed in any position and at any ang This apparatus is a very fine specimen of mechanical co struction.

(To be continued.)

Indian Railway Development.—Some items of intere concerning the development of the Indian railways are give in the *Railway Gazette*. All the railway companies have hand numerous constructions of new lines, remodelling yards and stations, and improvements in carriage and wag supply. The construction has just been sanctioned of 26 mil of railway of 5 ft. 6 in. gauge by the Bengal-Nagpur Railwa from Barkakana, South Karanpura Colliery, to Chandi. Tl Madras & Southern Mahratta Railway has in hand the co struction of a marshalling yard at Tondiarpet, increased ligh ing arrangements, renewal of rails, girders and engines, an the elimination of level crossings. The Nizam's Guarantee State Railway has in mind a big scheme for overhauling th old workshops at Lalaguda and remodelling them for the r quirements of the next ten to fifteen years. It is estimate that the provision of suitable cranes, pneumatic and electric equipments alone, will amount to nearly Rs. 5 lacs. M G. R. G. Huddleston is in charge of this remodelling scheme

Italian Trade and Industry.

The Development of National Production.

Messrs. J. H. Henderson, O.B.E., and H. C. A. Carpenter, Commercial Secretaries at the British Embassy, Rome, have forwarded to the Department of Overseas Trade a report,* revised to March, 1925, upon the commercial, industrial, and economic situation in Italy.

The report commences with a general review of the economic position in which it is declared that in this respect Italy is stronger than she has been at any time since the war. In public finance there is a good prospect of the Budget balancing in the current year; the internal national debt is lower; and the revenue from taxation has been increased by a re-assessment of the value of property and better methods of collection. The cost of living is high, due principally to the dependence of Italy upon foreign foodstuffs and raw materials, and the question of employing the surplus population is acute. It is thought that this surplus will have to be absorbed by industry as the land is already supporting as many workers as it can bear. From the point of view of British export trade, it may be said that the present economic situation of the country is such as justly to inspire confidence in the credit and stability of the market. At the same time, it is becoming increasingly difficult for British manufacturers and traders to secure and retain a footing in Italy, largely on account of the growing competition from local industries, and they cannot afford to spare any effort if they are to achieve success.

In reviewing the financial position, the report says that among the industries in which the banks are principally interested are the electrical, traction, and metallurgical industries. During 1923-24 there was a net increase of 588 million lire in the capital invested in the electrical industry. Italian financiers have provided funds for the construction of electrical works outside Italy, including investment in the "Steweag," a hydro-electric undertaking in Styria; and the Société des Forces hydro-électrique de Syria, in which an Italian group is said to be financing the construction to the extent of 100 million lire. As regards the investment of foreign capital in Italy, it is said that a certain amount of foreign capital has been attracted in connection with the concession of the telephones and radio-telegraphy and telephony to private enterprise.

Foreign Trade and Market Conditions.

It is shown that the United Kingdom took the second largest share of Italy's import trade in 1922, 1923, and 1924, the amount increasing each year to 2,176 million lire out of a total of 19,388 million lire in 1924. The United States occupied the first place, Germany coming third (reparation imports being excluded). Details of Italy's electrical imports and exports were published in our issue of June 12th (p. 953). The report says that Germany has always been foremost in the manufacture and supply of electrical apparatus for, and she still heads the list of countries which export to, Italy. There is every reason to suppose, however, that in time Italy will become more and more independent of outside assistance. The largest generators as well as the smallest motors can be turned out in the Italian factories, which are dependent on foreign material but can command excellent technical skill, and, with training and experience, production is bound to improve. Great Britain has little place in this market, her principal contributions being in items other than the above. It is interesting to note that orders for transformers for South America have been placed in Italy, though German influence has hitherto been predominant in that part of the world. The majority of the accessories (not including certain accessories for motor-cars) for the electrical trade can be manufactured in Italy to-day. There are also several factories turning out electric lamps, which were previously derived from Great Britain and Holland. Swedish and American firms have been making a speciality of metal goods such as electric vacuum cleaners and electrical household and barbers' requirements, selling them in Italy at prices far below those charged for similar articles in England.

The delay in the reorganisation of the telephone and telegraph systems has hindered business in this direction. The arrangements for the transfer of the telephones to private enterprise are now, however, well advanced, and when they are complete it may happen that the increased demand which is bound to occur for apparatus will divert a portion of the trade to Great Britain. There is certain to be a brisk demand for radio receiving sets, and British manufacturers may find it to their advantage to make certain sacrifices of prices to get a firm footing in this market, which is bound to develop.

Industry and Production.

The latest reports tend to show that Italian industries were, on the whole, actively employed during 1924, and some of them appear to have enjoyed a period of prosperity in marked contrast with the depression which they passed through between 1919 and 1922. Parallel with the electricity producing and distributing concerns, the electro-technical industry of Italy has continued to develop, and it is claimed that at present it can produce almost all the requirements of the country in electrical goods, including hydro-electric sets of any power. Electric meters were formerly imported from the United States and Germany; now the importers have to meet local competition. The only apparatus of which the production is not yet developed on a large scale are machines such as converters, transformers, and other appliances of a similar nature. The output of hydraulic turbines for Italy's power stations from five important firms and a few others up to the end of 1923 was 7,589 machines producing an aggregate of 3,337,274 h.p. It is stated that some of the firms propose to extend their activities into foreign markets. Other firms have specialised in batteries for lighting railway carriages and in accumulators. Electric wires and cables are made by a firm in Milan and Turin, which not only dominates the home market, but also does an export trade. Magnetos and electric incandescent lamps are also produced; the latter, however, are not manufactured in sufficient quantities to meet the national demand, which is more than double the production. As regards telegraphic and telephonic material, the greater part is imported from America or Germany, and a small proportion made in Italy in factories controlled chiefly by American or German groups. Radio material is largely imported, but is also made in the country by the Italo-Marconi Company in its factory near Genoa, and by other firms. The electro-technical industry has had a good season, and the factories have been able to run continuously both for home requirements and for export.

Hydro-Electric Development.

According to a recent publication of the Consiglio Superiore delle Acque, 4,129 water-power concessions, covering 3,430,209 h.p., had been granted up to December 31st, 1923, and it was estimated that 60 per cent. of the power represented was in full use at that date. The capital invested in hydro-electric undertakings is stated to amount to 3,500 million lire, the average return upon this being 6.75 per cent. Plants capable of producing 2,209 million kWh annually are under construction, and plans have been prepared for a further 56 stations to generate 3,908.5 million kWh. The consumption of hydro-electric power in 1923-24 was about 6.5 milliards of kWh, which is considered to be equal to about 6.5 million tons of coal. The Tirso reservoir and hydro-electric plant in Sardinia (Elec. Rev., June 6th, 1924, p. 925) was formally opened by the King last year. The work on the dams of the artificial lakes on the Sila in Calabria is said to be advancing satisfactorily, and the first central station, generating 100,000 h.p., is due to be finished by the end of the current year. The linking-up of the various hydro-electric power stations of the Alps and the Apennines has already made some progress. The energy produced on the Adamello (Alps) is now transmitted when required to the Ligure-Toscana (Apennines); the Società Bresciana (Alps) transmits its energy to the Emiliana (Apennines) and *vice versâ*; the Edison Co. (Alps) has been linked up with the Emiliana Idroellettrica "Ligure" and Nevri (Apennines). Work is in progress for the interconnection of many other stations, and the network of lines which will thus be constituted will probably be the most powerful system of transmission of Alpine electrical energy in existence.

Railway Electrification and Construction.

During the year to June 30th, 1924, about 82 km. of line was electrified, bringing the total length of electric railway to 780 km.; a further 810 km. is in course of electrification. An Appendix to the report contains details of the lines already electrified or in course of electrification on July 1st, 1924. The most important of the lines already electrified is the Torino P.N. Ronco system (*via* Isola del Cantone), which has a length of 137 km. The sections in course of electrification include the Genova P.B.-Livorno, 181 km.; the Bologna-Firenze, 132 km.; the Roma-Sulmona, 172 km.; the Foggia-Benevento, 101 km.; and the Faenza-Firenze, 101 km. Work on the last line is at present suspended. The system of traction adopted is three-phase, 3,700 V, with two overhead wires. There are three exceptions to this, two of which employ direct current at 650 V (third-rail system), the other using direct current at 3,000 V (overhead wire).

It is reported that a provisional contract for the construction of an underground railway in Rome was signed, in August last year, by the Municipality and an Italo-French group. Plans have been submitted to a committee, which recommends an exhaustive examination to dispel the doubt which exists as to the possibility of carrying out the scheme. In the meantime the option granted to the Italo-French group is being contested by the Sindicato Italiano per la Metropolitana di Roma, which requires to have its scheme for the railway taken into consideration.

Telegraphy and Telephony.

Although no steps had been taken up to the end of last year to transfer the telegraphs to private management, a scheme for the transfer of the telephones was published in September last. This provides that the preponderance of the capital subscribed shall be Italian, and measures have been taken to prevent concessionaires from increasing the tariff

* Stationery Office, 4s. net.

rates during the first three years; indeed, it is expected that a reduction will be effected by competition between the various groups.

Since the concession to the Società Italo Radio in 1923 of radio-telegraphic services, the company has been actively preparing itself for the functions which it has undertaken. Its capital is being increased from 7 million to 60 million lire, and technical and traffic agreements have been made with the Marconi interests, the Telefunken concern, and the Cie. Générale de T.S.F. to ensure the use of foreign patents and co-operation with other companies' stations in all parts of the world. The Italo Radio largely participates in the Compagnia Radiotelegrafica Brazileira and the Transradio Argentina. The station at Coltana was the first to be put into operation, the aerial system being improved and 800 kW of transmitting plant installed. From this station communication with South America is assured. Stations to deal with North American and European traffic are being erected. The second centre, at Rome, is to consist of two transmitting stations for European and trans-Continental traffic respectively, and there will be a third centre at Milan. Coastal stations for communication with ships will function at Genoa, Trieste, and Naples.

A Royal Decree of July 10th, 1924, approved the text of regulations governing broadcasting. Under these regulations a licence fee of 75 lire is charged upon each receiving set; of this the Government retains 25 lire, the balance going to the broadcasting concessionaire. A tax, of which 15 lire is payable to the Government, and from 20 to 180 lire (according to the number of valves) to the concessionaire must be paid before the apparatus is exhibited for sale. The Government reserves the right of increasing the fees by 300 per cent. in the case of foreign apparatus, but has so far made no use of this reservation. Broadcasting was commenced from the Rome station by the Società Unione Radiotelefonica Italiana in October last; other broadcasting stations are planned to be erected at Milan and Palermo.

Reference is made in the report to the submarine cables connecting Italy and America, and it is stated that a Royal Decree of December 13th last confirmed a convention with the firm of Pirelli (Milan), which conferred on the company the task of laying and keeping in order the submarine cables which are the property of the State.

Difficulties and Methods of Trading.

Under this heading one section of the report gives, as usual, information regarding the conditions to be met by traders. It is said that the activity of the Italian factories, while it may lead to a reduction of imports in a number of lines, may possibly result in a demand for the finer and more expensive qualities of goods in which British factories have always taken the lead. As we have already mentioned, German competition is severe, much of the success being due to the intensive campaign of German representatives in Italy. It is important for British traders to realise, as the Germans do, the necessity for securing that real acquaintance with the needs of the market which can only be obtained by means of personal visits by representatives with a thorough knowledge of Italian. If correspondence is resorted to, it should be in Italian, or, at least, in French, as should also catalogues and specifications. Italians in many cases are accustomed to giving long credits, and they expect the same treatment from abroad. It may be stated that a large number of German and a few American firms have decided to establish factories in Italy to avoid being driven off the market; in other cases a controlling interest has been obtained in Italian concerns. Price is, after all, the dominating factor; Italy is not a country which can afford to pay a higher price for a superior article when an inferior one which will answer the same purpose can be obtained more cheaply. The problem is not an easy one, because competitors, especially German and Italian, have often enough in reserve to drop their prices and still maintain a reasonable profit. It is the practice of some firms to discover what is the lowest British quotation and then quote 5 per cent. or or so less.

Boiler Explosion.—We have received a copy of the Report of a Preliminary Inquiry into the explosion which occurred at the power station, Upper Boat, Pontypridd, of the South Wales Electrical Power Distribution Co., when a superheater tube was fractured for a length of 7½ in. The explosion was caused by the tube becoming so reduced in thickness as to be unable to withstand the pressure to which it was subjected. As the superheater was not insured, it was not inspected at the time of inspection of the rest of the boiler.

A New Electric Hammer.

Centrifugal Force in the Conversion of Rotary into Reciprocating Motion.

At a recent interesting demonstration held at the headquar of the Kango Co., Ltd., we were afforded the opportunity seeing the application of an invention of Professor Goldschm in which centrifugal force is used for the conversion of rot into reciprocating and progressive motion, in a new elec hammer which this company is about to put on the marke

In the "Kango" hammer the reciprocating and progres effect, which amounts to definite blows, is obtained by rotation of two heavily loaded bevelled gear wheels pla facing each other, each driven through the same bevel pin carried by a spline shaft, in opposite rotational direction the other. The weights of the loaded gear wheels are brou into juxtaposition at two points in their path of rotation each revolution, each time converting their centrifugal fo into a sharp oscillating motion forming the blow which is veyed to the chisel or other tool through a transmitter l in position by an oil-retaining leather diaphragm; the reco taken by a spiral spring which serves to kill vibration adds impetus to the blow on the tool. A section of the h mer, with the important features indicated, is shown in fig

The drive from the motor shaft to the spline shaft, of wh the bevel pinion is an integral part, is taken through a spe form of centrifugal coupling which obviates any sudden ch on the spline shaft being conveyed to that of the motor. coupling consists of a square box on an extension of the ar ture shaft, and two weighted links which fit in slots in periphery of the box, and which are in turn connected by pins to a driving piece fitted with internal splines makir free fit on the spline shaft. When the hammer is at rest external points of the links are at the inside extremities of slots at an acute angle with the driving piece, but as speed rises they fly out in alignment with the driving p and respond instantly to any retardation of the spline sh leaving the internally splined driving piece absolutely free the shaft so that it can move up and down freely with friction.

The M.L. driving motor is universally wound for either

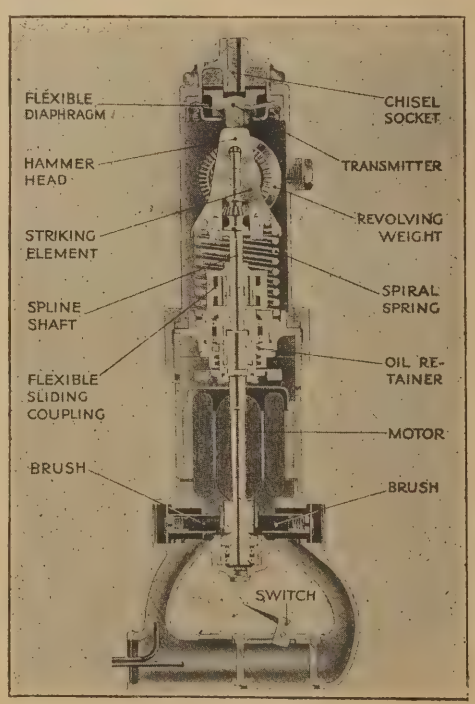

Fig. 1.—The Goldschmidt Hammer in Section.

Fig. 2.—Exterior View of the Hamm

200 or 220 V, and is encased separately with its brushes at end nearest the stirrup handle and switch, the whole b ventilated by a special fan. An oil-tight joint separates mechanical unit from the motor, the mechanical element ning in an oil bath.

The motor speed, which is in the vicinity of from 9,0 10,000 r.p.m., is reduced at the bevel gearing in the rat 3 to 1; the current consumption of the 220-V hamme approximately 1.4 A.

It will be seen that, by virtue of the sliding coupling, actual percussion blow of the hammer is essentially a flo one; this ensures against overloading the motor.

The hammer in its present state is not sufficiently pow for ordinary riveting and work of equal weight, but witnessing a few of its applications we feel assured that it a wide field and that its prospects of superseding the I

atic hammer are good. One most interesting point involved the principle of the invention which favours the development larger hammers is that variation in speed produces a harmonic variation in the reciprocating motion, and as the speed increased blows of proportionately increased intensity to ose obtained at one blow per revolution of the crown wheels n be obtained at every second or third revolution.

Some of the demonstrated uses of the hammer were: chisel oss-grain cutting of wood, producing a smooth surface cut; rip cutting from 3/16 in. mild steel and groove cutting into ild steel; drilling and cutting into brickwork, stone and arble. A test on marble resulted in a $\frac{5}{8}$-in. hole being drilled in. deep in 60 seconds.

Fig. 2 illustrates the external appearance of the hammer, e weight of which is 9.25 lb.

outh American Electrical Notes.

(From Our Special Correspondent.)

v electrical plant is to be constructed at Bluefields, Nicaragua.

ıe market for wiring devices has broadened in this part of ıntral America of late, but, to a great extent, supplies are ovided by American houses.

An electric light plant is to be installed at Cascavel, in the ate of Ceará, Brazil. The concession has been granted for a riod of 25 years, at the expiration of which time the plant ll become the property of the municipality without compentiom. No taxes are to be collected in the meantime, and the achinery and plant, for which tenders will be invited from road, will be allowed to enter the country free of duty.

The electric light and power plant established in Guayaquil, uador, is about to be considerably extended, a foreign corration having purchased a controlling interest in the underking.

With the plenitude of funds now at their disposal owing to ə improved financial condition of Argentina, several of the itish-managed railways in that Republic are proceeding with ə work of installing large new electrical plants. While due ention has been, and is being, given to the requirements of ə rapidly-extending suburban districts of the capital, addinal facilities are being introduced into certain of the railway tions such as those of the Southern, at Plaza Constitución, d the Western. Further electrification on the Central Argene line is also to be commenced this month (July), while the n of 7,000,000 pesos (paper) has been allotted by the Pacific ilway Company for additional improvements and extensions its terminus at Retiro. Among native-owned railway enterses, the Spanish-Argentine Electricity Company (Compañia spano-Argentina de Electrícidad) is about to erect a new wer-house which will considerably alter the appearance of, d increase the facilities provided in, the capital. The plans l for the erection of an electric power station with a chinery installation of 250,000 h.p. When this work has en completed the station—it is claimed—will rank with the gest in the world. It is expected that the construction and ə installation of the specially planned equipment will be npleted during the year 1927.

The Brazilian authorities, after considerable hesitation, have nted permission to the A.E.F.G. consortium (American, glish, French, and German) for the construction of a large w radiotelegraphic station at the port of Pernambuco. The ntractors have already been appointed, and are busy prepar- plans and materials. It is estimated that the station can- be completed before 18 months or two years from the date it the works are started. With seven towers, each 150 tres high, the station will be used primarily as a receiv- relay station between Europe and the United States on one hand, and between Rio de Janeiro and Buenos Aires the other. Such an installation has long been regarded as ispensable for the maintenance of an uninterrupted service, ause of the poor receiving conditions existing at Rio de neiro. In addition to the usual services, the Pernambuco tion will deal with relayed transmitted messages from Rio Janeiro and Buenos Aires. Much, however, will depend on the sending conditions in the south. The station is being ipped to communicate directly with both the United States l Europe.

n Brazil, the sale of radio apparatus has fallen off considery during the past few months. The slackness is said to be to anticipated technical improvements. The greater part he apparatus sold at present is of German origin.

rom Peru it is learned that the recent inauguration of radio adcasting created considerable local interest, with attendant d sales of apparatus. Owing to the existence of a local imt monopoly of these manufactures, and the United States ota of 50 per cent. of total purchase having been exhausted, remainder of trade demands must be purchased from the ited Kingdom. It is understood that stocks of supplies are y low and importers are anxious to replenish them.

Notes from Canada.

(From Our Special Correspondent.)

English readers will be interested in hearing of the winning of a $5,000 prize, offered by an American firm, by Mr. David Cowan, a young Englishman now resident in Canada. Messrs. Bonbright & Co., a firm of bond brokers in the United States, recently offered prizes totalling $10,000 for the best essay on the development of the electrical industry to cover the ten-year period 1920 to 1930. It will be seen that half of the period covered would require a description of actual events, while the other half would necessarily be prophetic. Mr. Cowan secured the first prize in competition with 437 others from various parts of the North American Continent. The judges in this competition, the American Superpower Corporation, have offered a single prize of $10,000 to be awarded to the competitor whose prophecies shall be found in 1930 to be most nearly correct for the five-year period 1925 to 1929.

Some three months ago the Hydro-Electric Power Commission of Ontario applied to the Dominion Government at Ottawa for permission to develop power on the St. Lawrence river near Morrisburg. This power site lies on a stretch of the river, the water rights on which, both for power and navigation, belong jointly to the United States and Canada. For this reason it was necessary for the application to be made to the Dominion and not to the Provincial (Ontario) Government. It has recently been announced that the application cannot be considered until the Joint Engineering Board, appointed last year by the two countries, has issued its report on the whole subject of power development on the St. Lawrence.

The statement has recently appeared in the daily papers that the Hydro-Electric Power Commission of Ontario has been granted permission to go ahead with the development of 250,000 horse-power on the Ottawa river at a cost of $25,000,000. This power will serve the needs of the eastern part of Ontario, which has so far had very little power available for local use.

An Ontario organisation, the Association of Municipal Electrical Utilities, recently held a convention at Niagara Falls, Ontario, and though Sir Adam Beck, chairman of the Hydro-Electric Power Commission, was unable to be present, he sent a letter in which he gave some interesting figures relating to the work of the Commission. During the past year the number of municipalities under contract with the Commission has increased from 356 to 386 and the aggregate amount of power generated by the Commission's various plants, in December, 1924, reached the total of 780,000 horse-power. In 1924 the capital investment in this provincial undertaking amounted to about $263,000,000 and the annual revenue is now nearly $19,000,000.
